California and Western Medicine

Official Publication of the
CALIFORNIA MEDICAL ASSOCIATION

PRINTED AND EDITED

for the

California Medical Association

Under the direction of the House of Delegates and Council

GEORGE H. KRESS, M.D., *Editor*

VOLUME 48

JANUARY *to* JUNE, 1938

CALIFORNIA MEDICAL ASSOCIATION, FOUR FIFTY SUTTER
SAN FRANCISCO

NEW YORK ACADEMY OF MEDICINE
OCT 18 1938
217452

Index—California and Western Medicine, Volume 48
January to June, 1938

INDEX ARRANGEMENT

Sequence of Subheads in Index

This index is arranged under the following headings:

I. Authors.
II. Subjects—Titles of papers.
III. Editorials.
IV. Editorial Comment articles.
V. Bedside Medicine articles.
VI. Medical History articles.
VII. Miscellany columns.
VIII. California Medical Association.
 (a) General.
 (b) Component County Societies.
 (c) Department of Public Relations.
 (d) Woman's Auxiliary.
IX. Deceased Members.
X. Book Reviews.
XI. Report of Medical Examiners.

Key to Abbreviations in This Index

Or.—Original Article.
C. R.—Case Report.
B. M.—Bedside Medicine.
Ed.—Editorial.
E. C.—Editorial Comment.
C. N.—Clinical Notes.
L. M. H.—Lure of Medical History.
Sup.—Supplement (by month).

Index to Pages, Volume 48, California and Western Medicine, January to June, 1938

Date of Issue	No. of Pages
January	1–72
February	73–152
Supplement, Membership Roster, 1937	1–24
March	153–232
April	233–304
Supplement:	
Annual Session Program, Part I	1–32
Pre-Convention Bulletin, Part II	33–52
May	305–392
June	393–480

Two Volumes Yearly

CALIFORNIA AND WESTERN MEDICINE is issued annually in two volumes: the first, from January to June, inclusive; and the second from July to December, inclusive.

Attached to the current volume (Volume 48) were two supplements, as follows: February issue, supplement on Membership Roster (1937); April issue, supplement on Annual Session Program and the Pre-Convention Bulletin.

American Medical Association Quarterly Cumulative Index

Members who wish to consult a general medical index are referred to the Quarterly Cumulative Index of the American Medical Association.

I
AUTHORS—INDEX

A

Abbott, Kenneth H.—Thrombocytopenic Purpura Hemorrhagica (Or.) 332
Alderson, Harry E.—Surgery and Syphilis (B. M.) 36
Anderson, Hamilton H., and Reed, Alfred C.—"Natural Immunity" versus Drug Toxicity in Malaria (E. C.) 160
Awtrey, Hugh, and Walker, G. W.—Infections in the Danger Area of the Lips, Face, and Nose (Or.) 427

B

Baker, Fred—Potassium Iodid: Its Use (C. N.) 356
Bames, H. O.—Reconstruction of the Enlarged Breast (Or.) 341
Barkan, Hans—Surgery and Syphilis (B. M.) 37
Barkan, Otto—Microsurgery in Chronic Simple Glaucoma (Or.) 10
Barrett, P. S., and Geiger, J. C.—Neonatal Mortality in San Francisco (E. C.) 80
Best, Elbridge J.—Tetanus (B. M.) 192
Birnbaum, Walter, and Butler, Edmund—Traumatic Rupture of the Spleen (Or.) 407
Bower, Albert G.—Tetanus (B. M.) 191
Boyle, James J.—As a Pharmacist Views the Proposed California Humane Pound Law (Or.) 257
Brooks, LeRoy:
Postoperative Treatment in Peritonitis (E. C.) 399
What Is to Be Expected of Blood Transfusions (B. M.) 268
Buckley, Thomas I.—Brucellosis of the Male Genitalia (Or.) 175
Burger, Thomas O., and Torbert, Harold C.—Abdominal Abscesses: Their Treatment (Or.) 252
Butler, Edmund, and Birnbaum, Walter—Traumatic Rupture of the Spleen (Or.) 407

C

Carter, Harold D., and Pryor, Helen B.—Phases of Adolescent Development in Girls (Or.) 89
Cline, John W.—Lycopodium Granuloma, an Avoidable Surgical Complication (C. N.) 189
Collins, Donald C.—Abdominal Hernias (Or.) 317
Cooder, Howard R.—What Is to Be Expected of Blood Transfusions (B. M.) 269
Cox, Alvin J., Jr.—Stomach Mucosal Changes in A-Avitaminosis (Or.) 444
Crane, Jay J.—Primary Tumors of the Ureter (Or.) 442
Crowe, Harold E.—Convalescent Homes (E. C.) 311
Cushman, Ruggles A.—The Criminal Insane (Or.) 83

D

Dallas, Donald A.—The Myomatous Uterus (B. M.) 358
Dalton, James W., Kerr, William J., and Gliebe, Paul A.—Physical Phenomena Associated with Anxiety States: The Hyperventilation Syndrome (Or.) 12
Drury, Douglas R., Greeley, Paul O., Ziskind, Eugene, Ziskind, Esther Somerfeld—The Mechanism of Insulin Therapy in Schizophrenia (E. C.) 310

E

Eaton, Chelsea—The Proctovacuator (C. N.) 119
Eaton, H. Douglas:
Handwriting a Neurological Study (Or.) 430
Insomnia (B. M.) 123
Eddie, Bernice U., Hurwitz, Samuel, and Young, John Edward—Coccidioides Immitis Intradermal Skin Reaction (Or.) 87
Escamilla, Roberto F., Lisser, Hans—Simmonds' Disease (Hypophyseal Cachexia) (Or.) 343
Evans, George H.—A Harveian Pilgrimage (L. M. H.) 447

F

Field, John—On the Fate of Epinephrin in the Body (E. C.) 9
Fishbein, Morris—Medicine and National Policy (Or.) 21
Fisher, Robbin E.—Psyllium Seeds: Intestinal Obstruction (C. R.) 190
Frawley, J. M.—The Treatment of Typhoid Fever in Children, by Means of Lysed Vaccine (Or.) 415
Futch, Charles E.—Maxillary Sinus Irrigation Through the Ostia (Or.) 438

G

Geiger, J. C.—Acute Anterior Poliomyelitis (Or.) 245
Geiger, J. C., and Barrett, P. S.—Neonatal Mortality in San Francisco (E. C.) 80
Gilcreest, Edgar Lorrington — Hugh Huger Toland (L. M. H.):
Part I 263
Part II 350
Glaser, Mark Albert, and Thienes, Clinton H.—Dural Defects: How Important Is Their Surgical Repair (Or.) 163
Gliebe, Paul A., Dalton, James W., and Kerr, William J.—Physical Phenomena Associated with Anxiety States: The Hyperventilation Syndrome (Or.) 12
Gogol, Louis J.—Local Injection Anesthesia: Some Errors in Connection with Its Use (E. C.) 8
Goldwasser, Marian—Primary Dysmenorrhea (Or.) 418
Graham, William E., Topping, Norman H. — Hemopoietic Aplasias Following the Arsphenamins, with Two Case Reports (C. R.) 353
Gray, P. A., and Wills, Irving—Diabetic Surgery (Or.) 16
Greeley, Paul O., Ziskind, Eugene, Ziskind, Esther Somerfeld, Drury, Douglas R.—The Mechanism of Insulin Therapy in Schizophrenia (E. C.) 310

H

Hanson, Samuel—Hemorrhage and Shock Incident to Cesarean Section (E. C.) 239
Hara, H. J.—Ionization in Allergic Rhinitis (Or.) 424
Harris, Junius B.—Salutation from Junius B. Harris (Or.) 393
Holman, Emile, Pierson, Philip—Selective Collapse by Partial Thoracoplasty (Or.) 312
Homer, Frank—Federal and California State Narcotic Laws (Or.) 262
Huff, George D.—Mediolateral Episiotomy (Or.) 177
Hunt, William Remfry—Tonsillectomy: A Planned, Complete Operation (Or.) 322
Hurwitz, Samuel, Young, John Edward, Eddie, Bernice U.—Coccidioides Immitis Intradermal Skin Reaction (Or.) 87

I

Imerman, Carlyle P., Imerman, Stanley W.—Thrombocytopenic Purpura Hemorrhagica (Or.) 335
Imerman, Stanley W., Imerman, Carlyle P.—Thrombocytopenic Purpura Hemorrhagica (Or.) 335
Inman, Thomas G.—Insomnia (B. M.) 122

J

Jacobson, H. J.—Intra-Oral Lesions (B. M.) 454

K

Kaufman, R. L.—An Epidemiological Study of an Outbreak of Syphilis (C. R.) 450
Kerr, William J., Gliebe, Paul A., and Dalton, James W. Physical Phenomena Associated with Anxiety States: The Hyperventilation Syndrome (Or.) 12
Koehler, Alfred E.—Functional Indigestion (Or.) 247
Kress, George H.—Los Angeles County Hospital Collection Bureau (Or.) 97
Kulchar, George V.—Intra-Oral Lesions (B. M.) 453

L

PAGE

Langstroth, Lovell.—Insomnia (B. M.) 121
Lawrence, N. Berwyn, and Shryock, E. Harold—Multiple Congenital Abnormalities (C. R.) 32
Lawrence, W.—Compensatory Pressure in Anesthesia For Thoracic Surgery (Or.) 182
Leake, C. D.—Cardiac Syncope and Sudden Death (E. C.) 6
Legge, Robert T.—Robert Armistead McLean (L. M. H.) 114
Lisser, Hans, Escamilla, Roberto—Simmonds' Disease (Hypophyseal Cachexia) (Or.) 343
Little, R. P.—What Does "Neurotic" Mean? (C. N.) 449

M

Manwaring, W. H.:
Crystallized Lysozyme (E. C.) 398
Experimental Renal Hypertension (E. C.) 6
Reversible Germicides (E. C.) 161
Mayer, Harry J.—Creeping Anoxemia in Bronchopneumonia (E. C.) 238
McCuskey, Charles F.—Regional Anesthesia for Orthopedic Operations (Or.) 179
McNaught, James B.—Trichinosis (Or.) 166
Merrill, Malcolm H.—California Venereal Disease Control Program (Or.) 24
Moffitt, Herbert C.—William Watt Kerr (L. M. H.) 27
Molony, William R., Sr.—Federal and State Narcotic Laws: Cautions for Physicians (Or.) 261
Montgomery, Douglass W.:
State Medical Association and Other Reminiscences (L. M. H.), Part I 446
The Passing of Professor George H. F. Nuttall (L. M. H.) 118
Morrow, Howard:
Physicians' Activities in the Field of Medicine (Or.) 402
Salutation from President 305
Movitt, S. I.—Gonorrhea in Pregnancy (C. N.) 452

N

Newell, Robert R.—Hospital Radiologists and Pathologists (E. C.) 79
Novy, Frederick G., Jr.—Drug Eruptions Due to the Barbiturates (Or.) 324

P

Page, Clarence W.—The Myomatous Uterus (B. M.) 358
Parsons, H. H.—Eosinophilic Bodies in Measles (C. N.) 266
Pearl, Felix L.—The Treatment of Chronic Occlusive Peripheral Arterial Disease (E. C.) 237
Phillips, Charles Eaton—Surgery and Syphilis (B. M.) 35
Pierson, Philip, Holman, Emile—Selective Collapse of Partial Thoracoplasty (Or.) 312
Powers, Robert A.—Rotating Anode X-ray Tube (Or.) 339
Pryor, Helen B., and Carter, Harold D.—Phases of Adolescent Development in Girls (Or.) 89

R

Reed, Alfred C., and Anderson, Hamilton H.—"Natural Immunity" versus Drug Toxicity in Malaria (E. C.) 160
Reich, William W.—Squamous Epithelial Bone Cyst of the Terminal Phalanx (C. R.) 120
Robinson, Saul S.—Iododerma Due to Lipiodol (C. R.) 34
Rodin, Frank H.:
Glaucoma (E. C.) 400
Strabismus in Children (E. C.) 238
Rowe, Albert—The Practical Use of the "Elimination Diets" (E. C.) 161

S

Schaller, Walter F.—Is Paresis (Dementia Paralytica) Curable? (Or.) 409
Shryock, E. Harold, and Lawrence, N. Berwyn—Multiple Congenital Abnormalities (C. R.) 32
Shuman, John W.—Thyroidism (C. N.) 187
Spalding, Clara H.—The Endocrines and Behavior in Puberty (Or.) 251
Sweet, Clifford—What Is to Be Expected of Blood Transfusions (B. M.) 273
Swett, W F.—Snake Venom: Its Use in Postoperative Hemorrhage of the Eye (Or.) 173

T

Taylor, Richard T.—Roentgen Therapy: Some of Its Complications (Or.) 94
Templeton, H. J.—Intra-Oral Lesions (B. M.) 456
Templeton, H. J., Truman, Stanley R.—Endocrine Therapy in Acne Vulgaris (Or.) 337
Terry, Wallace I.—Thomas Waterman Huntington, A.B., M.D., LL.D. (L. M. H.) 186
Thienes, Clinton H.—Proposed California Humane Pound Law: How It Would Affect Medicine and Pharmacology (Or.) 258
Thienes, Clinton H., and Glaser, Mark Albert—Dural Defects: How Important Is Their Surgical Repair (Or.) 163
Tillotson, Joseph E.—The Unpadded Plaster of Paris Cast (E. C.) 7
Tobias, Milton—The Nutritional Problem in Toxemias of Contagious Diseases (Or.) 435
Tollefson, Donald G.—The Myomatous Uterus (B. M.) 358
Topping, Norman H., Graham, William E.—Hemopoietic Aplasias Following the Arsphenamins with Two Case Reports (C. R.) 353
Torbert, Harold C., and Burger, Thomas O.—Abdominal Abscesses: Their Treatment (Or.) 252
Truman, Stanley R., Templeton, H. J. — Endocrine Therapy in Acne Vulgaris (Or.) 337
Twitchell, Edward W.—Psychopathic Personality: As a Household Problem (Or.) 421

U

Upton, John R.—Acute Gonorrheal Arthritis Complicating Pregnancy (Or.) 326

V

Vener, Hyman I.—Tetanus (B. M.) 193

W

Walker, Clifford—Control of Certain Blindness Hazards Among Myopic Children and Adults (E. C.) 159
Walker, G. W., and Awtrey, Hugh—Infections in the Danger Area of the Lips, Face, and Nose (Or.) 427
Washburn, William W.—Hyperparathyroidism: With Special Reference to Parathyroid Adenoma (Or.) 240
Whalman, Harold F.—Critical Decisions in Cataract Surgery (Or.) 255
Widney, Joseph P.—A New Europe (E. C.) 78
Wills, Irving, and Gray, P. A.—Diabetic Surgery (Or.) 16
Wyckoff, H. A.—Monocytic Leukemia: Some Blood and Bone-Marrow Studies (Or.) 348

Y

Young, John Edward, Eddie, Bernice U., and Hurwitz, Samuel—Coccidioides Immitis Intradermal Skin Reaction (Or.) 87

Z

Ziskind, Esther Somerfeld, Drury, Douglas R., Greeley, Paul O., Ziskind, Eugene—The Mechanism of Insulin Therapy in Schizophrenia (E. C.) 310
Ziskind, Eugene, Ziskind, Esther Somerfeld, Drury, Douglas R., Greeley, Paul O.—The Mechanism of Insulin Therapy in Schizophrenia (E. C.) 310

PRACTICE of MEDICINE

By JONATHAN CAMPBELL MEAKINS
1343 pages, 505 illustrations,
35 in colors.
Price, $10.00

Meakins' book is the first work on practice that has added anything new and different to the books already in this field since Osler's book was published forty-four years ago. Arranged differently, based upon physiologic function, Meakins is styled to meet the modern trend. Thorough in its coverage, this book will broaden your knowledge and technic for handling the sick.

FRACTURES, DISLOCATIONS and SPRAINS

By JOHN ALBERT KEY and H. EARLE CONWELL.
2nd Edition.
1246 pages, 1222 illustrations.
Price, $12.50

A *new* edition of Key and Conwell "FRACTURES, DISLOCATIONS AND SPRAINS" is now ready. Every practitioner of medicine must be prepared to give first aid properly in traumatic injuries that come under his observation. At any time—day or night—this type of case may be brought to you. Be prepared for this possibility by having available for constant reference this brand new, practical and authoritative work on fractures.

METHODS of TREATMENT

By LOGAN CLENDENING.
6th Edition.
879 pages, 103 illustrations.
Price, $10.00

This Sixth Edition of this classic among therapeutic books is ready now. Carefully revised and brought up-to-date, this book combines in one volume *all* methods of treatment—Drugs, Diet, Physiotherapy, Psychotherapy. Furthermore, this is a personal book with all the charm of a great personality in medicine. *It is not a citation of the writing of others. It is Clendening at his best.*

TECHNIC OF LOCAL ANESTHESIA

First published more than a quarter of a century ago, this book, now appearing in its Sixth Edition, remains the favorite text on local anesthesia—the one work on anesthesia every physician should have. By Arthur E. Hertzler. New Sixth Edition. 284 pages, 142 illustrations. Price, $5.00.

MATERIA MEDICA, TOXICOLOGY AND PHARMACOGNOSY

Materia Medica, Toxicology and Pharmacognosy is a text and reference book on the therapeutics, toxicology, pharmacognosy and posology of the official drugs of the United States Pharmacopoeia XI and the National Formulary VI. This work will prove of value to physicians, pharmacists and students of pharmacy, of medicine, and of nursing. By William Mansfield. 707 pages, 202 illustrations. Price, $6.75.

The SYNOPSIS Books

IN THE every-day life of all physicians there come times when it is necessary to consult quickly an authority on a vital subject. Delay may be fatal, and so would unauthoritative advice. These are the vital moments when help is most needed and appreciated. The SYNOPSIS volumes were created to meet this need and they have met it.

Synopsis of GYNECOLOGY—By H. S. Crossen and Robert J. Crossen. New Second Edition. 240 pages, 115 illustrations. Price, $3.00.

Synopsis of ANO-RECTAL DISEASES—By Louis J. Hirschman. 288 pages, 174 illustrations, 6 color plates. Price, $3.50.

Synopsis of PEDIATRICS—By John Zahorsky and T. S. Zahorsky. New Second Edition. 360 pages, 85 illustrations. Price, $4.00.

Synopsis of DIGESTIVE DISEASES—By John L. Kantor. 260 pages, 40 illustrations. Price, $3.50.

Synopsis of GENITO-URINARY DISEASES—By Austin I. Dodson. New Second Edition. 275 pages, 111 illustrations. Price, $3.00.

Synopsis of DISEASES OF THE HEART AND ARTERIES—By George Herrmann, 344 pages, 88 illustrations, 3 color plates. Price, $4.00.

Synopsis of CLINICAL LABORATORY METHODS—By W. E. Bray. 324 pages, 32 illustrations, 11 color plates. Price, $3.75.

TEXTBOOK OF OPHTHALMOLOGY—VOL. II

The Second Volume of Duke-Elder "Textbook of Ophthalmology" is ready now. It covers "Clinical Methods of Examination, Congenital and Developmental Anomalies, General Pathological and Therapeutic Considerations, and Diseases of the Outer Eye." By Sir W. Stewart Duke-Elder. Vol. 2—1,000 pages, 742 illustrations, 24 color plates. Price, $15.00. (Volume I is also available. Price, $15.00.)

MEDICAL UROLOGY

Written especially for the general practitioner, this work supplies all the fundamentals on the subject and the details of differential diagnosis, pathology and treatment which are lacking in the works prepared for the specialist. It is an excellent volume, based upon the author's personal experience—it fills a well-defined and long-felt need in medical literature. By Irvin S. Koll. 431 pages, 92 illustrations, 6 color plates. Price, $5.00.

HANDBOOK OF ORTHOPEDIC SURGERY

Presents the fundamental facts and principles of orthopedic surgery in as concise a manner as possible. This book is not an opinion of one man or one trend of thought emanating from one clinic. It is a consensus of opinion on the various subjects as presented in the orthopedic textbooks and the more recent orthopedic literature criticized and tempered with the thought and opinion of 25 teachers of orthopedic surgery and others representing 18 different medical schools. By Alfred Rives Shands, Jr. 593 pages, 169 illustrations. Price, $5.00.

THE LABORATORY DIAGNOSIS OF SYPHILIS

The theory, technic and clinical interpretation of the Wassermann and Flocculation Tests with serum and spinal fluid. The book is more than a laboratory manual for the technician. An intelligent interpretation of the laboratory report by the physician is impossible unless he is familiar with the numerous sources of error inherent in the technic, and unless he is further aware of the exact significance of positive, negative, doubtful, partial, anti-complementary or conflicting reports. By Harry Eagle and J. Earle Moore. 440 pages, 27 illustrations. Price, $5.00.

● Physicians reading this announcement are invited to take advantage of the Mosby-Easy-Payment-Plan to stock their libraries with the books they need. Mosby books are available to you on terms as low as $3.00 a month—10 cents per day. READ AS YOU PAY—and keep your library up to date.

No Compromise With QUALITY

THERE is no compromise with quality in any phase of Riggs' prescription service.

Through the entire course of manufacture, rigid inspections during and after each operation insure the accuracy that is necessary to the exact interpretation of the ophthalmic prescription.

Mechanical developments of optical science have provided us with every means to produce ophthalmic prescriptions with strict adherence to the written ℞. Riggs' thoroughly trained and capable personnel provides the link that completes our chain of service.

The words of our language expressing pleasure are less numerous than those expressing pain. The same is true of health and disease, praise and blame, right and wrong. When a thing is right, it is likely to be taken for granted; when it is wrong, someone rushes into print about it. As long as we are in health, life is spontaneous and its processes go on almost unnoticed; but in ill-health the processes of life obtrude themselves upon our attention, and so get named. In general, the positive aspects of life meet with acquiescence, but the negative ones stir up words.

Education is a complex process, its factors being hard to measure, now and then difficult even to detect. Some are intuitive, some come in the natural course of experience, some operate only when one submits to guidance and authority, some when one relies on his individual effort and will.

AVAILABLE THROUGH ALL PHARMACIES

EMMENIN

The orally active, oestrogenic placental extract elaborated by Dr. J. B. Collip, Department of Biochemistry, McGill University.

(Canadian Medical Association Journal, February, 1930.)

IMPORTANT ANNOUNCEMENT . . .

By an improved technique developed in our laboratories, we have been able to render Emmenin entirely free from disagreeable taste and odor. This has been accomplished without loss of therapeutic activity, and the potency is ensured by carefully controlled biological assay.

DETAILS ON REQUEST

Emmenin is biologically assayed and standardized under direct control of the Department of Biochemistry, McGill University.

Yuba-Sutter County Medical Society
President, Stanley R. Parkinson, 434 Fourth Street, Marysville.
Secretary, Fred W. Didier, Wheatland.
Meeting, *Second Tuesday.*

(Roster lists continued on advertising page 6)

VITAMINS and TASTE

One of the reasons why so many physicians prescribe vitamins A and D in the form of MALTINE WITH COD LIVER OIL is that this preparation has none of the unpleasant oily consistency and taste usually associated with vitamin-bearing oils. Patients—even small children—enjoy it. Furthermore, the vitamin A efficiency of cod liver oil is actually *enhanced twofold* when emulsified with Maltine, as has been proved by carefully checked laboratory experiments. In addition to the vitamins of cod liver oil, this preparation also contains the valuable factors of Maltine.

Another preparation, MALTINE WITH COD LIVER OIL and IRON IODIDE, is also available, with a concentration of two grains of freshly prepared iron iodide per fluid ounce.... The Maltine Company, 60 Hudson Street, New York City.

* Deceased.

WE'RE SORRY TO SAY "NO"

Almost every mail brings a request for a specific Allergy Diet Sheet from some individual who has learned how helpful they can be to persons sensitive to wheat, milk, eggs or a combination of all three. We're sorry to say "no", but these sheets were prepared, in cooperation with recognized authorities, for professional distribution only.

On these Allergy Diet Sheets, planned to help both the physician *and* patient, are clearly and simply listed exactly which foods may be eaten and which avoided according to the patient's particular sensitivity. On the reverse side are safe and appetizing recipes. Each sheet also provides space for personal instructions and the physician's signature. No advertising appears on them.

RY-KRISP
Whole Rye Wafers

Safe and Delicious for Patients Sensitive to Wheat, Milk or Eggs.

Naturally Ry-Krisp is included prominently among the allowed foods—for these crunchy, richly flavored wafers, so simply made of whole rye, salt and water, are both perfectly safe and perfectly delicious. In fact, they actually encourage the patient to adhere more closely to the necessary diet—because they taste so good with other foods at every meal.

We will gladly send you copies of these sheets and samples of Ry-Krisp Whole Rye Wafers. Simply use the coupon.

RALSTON PURINA COMPANY
Dept. CW, 2336 Checkerboard Square, St. Louis, Mo.

Without obligation, please send me samples of Ry-Krisp and Allergy Diet Sheets.

COÖPERATE WITH YOUR ADVERTISERS

CALIFORNIA AND WESTERN MEDICINE, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention CALIFORNIA AND WESTERN MEDICINE.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this JOURNAL to members and readers.

A SERVICE AGENCY—FOR READERS

THE JOURNAL of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California Medical Association. The Cooperative Bureau is equipped with catalogues and price lists of manufacturers. and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in CALIFORNIA AND WESTERN MEDICINE, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. CALIFORNIA AND WESTERN MEDICINE and the A. M. A. Service Bureau desire to serve *you*.

Restraint and poise were esteemed as praiseworthy traits of human character. Actions within recognized limits were looked upon as natural; but transgressing those limits, as contrary to nature and, therefore, unbecoming. Hence, moderation or, as it was often termed, the golden mean, became a rule of life. Paul wrote to the Philippians: Let your moderation be known unto all men. The golden mean, from the modern point of view, is not for all times and places, yet without it men often go to extremes and so fail. While it is not the counsel of emergency, it is the guide to abiding power. Sprung from reason, and akin to patience, it commends doing, not overdoing, nor yet doing too little . . . *nequid nimis.* It accords with the laws of growth, seeking symmetry and proportion—the well-rounded development of body and mind. Opposing, on the one hand, austere and ascetic ways, and on the other, caprice and unbridled impulse, it fosters a well-ordered life, in which action is counterbalanced by repose, work by diversion, with due place for thought and reflection, for appreciation of things beautiful, and for reverence. Rightly understood and applied, this legacy from ages of experience helps us to attain well-being.—Leon J. Richardson.

One may learn to swim by the use of corks, but eventually one must swim alone. Teaching is analogous to the corks. Eventually one must carry on his education unaided and independently. The best fruits spring from individual initiative and self-directed effort.

Study brings pleasure; kindles enthusiasm. It makes the student feel akin to scholars, to artists and other creative workers, to educated men and women. He traces the history of the subject, thereby putting himself into a position better to comprehend its condition in his own time. He lays hold on its principles. Not content with what others have done in the field, he endeavors through his own research to discover new truth. Studying in this way he becomes educated.

One Thing Well Done

For more than twenty years "singleness of purpose" to do one thing well has been the underlying reason for the great popularity of the Baumanometer.

The three models—the **KOMPAK**, the **300** and the **WALL**—embody every refinement that modern, scientific research can suggest, or the hands of expert workmen can devise.

Everything to promote perpetual accuracy and lasting qualities, to enhance its beauty and to make it simple, compact, light and handy, is in every Baumanometer as it comes to the physician today.

Danger to Children of Lead in Colored Chalks.—Jephcott analyzed the colored chalks of five manufacturers. It was noticed that chalks of certain colors, yellow, orange, and green, contained in some cases relative large amounts of lead chromate. No lead was present in white, red, blue, brown, and black chalk. Cleaning blackboards and brushes in school, often performed by children, will be accompanied by the inhalation of lead dust when such chalks are used. It is likely that crayons should be viewed with the same suspicion. When it is realized that not more than 0.6 gram of metallic lead has caused a fatal case of lead poisoning, it is evident that these chalks, if continuously nibbled by children, contain sufficient lead to cause plumbism.—*Canadian Public Health Journal.*

Decongestion of the nasal mucous membrane with Propadrine Hydrochloride

PROPADRINE HYDROCHLORIDE is specifically indicated in relieving the nasal congestion of coryza, rhinitis, sinusitis and nasal pharyngitis. Its effective yet gentle decongestive action on the inflamed and engorged mucosa promotes freer drainage and permits more normal air-volume ingress.

Propadrine Hydrochloride, S & D (phenylpropanol-amine hydrochloride), is a synthetic analogue of ephedrine. Their pharmacological properties are similar, but Propadrine Hydrochloride is less toxic, as demonstrated by laboratory experiments confirmed in clinical practice.

In constriction of the nasal mucous membrane, Propadrine Hydrochloride produces prompt action and prolonged effect. Whenever a decongestive agent is indicated, it may be applied topically by saturated tampons, instillation or atomized spray.

As a bronchodilator in the control of bronchial spasms, Capsules Propadrine Hydrochloride exert a clinical response similar to ephedrine, but are usually free of the symptomatic disadvantages often accompanying the use of ephedrine such as nervousness, insomnia and motor-restlessness. For this reason, in chronic and protracted bronchial irritation, the use of Propadrine Hydrochloride usually obviates the necessity of simultaneously administering sedatives.

Propadrine Hydrochloride Products are available at most druggists, moderately priced on prescriptions. They are supplied in detachable label packages in the following convenient dosage forms:

Solution Propadrine Hydrochloride, 1%, in one-ounce bottles. An isotonic solution.

Nasal Jelly Propadrine Hydrochloride, 0.66%, in one-half-ounce collapsible tubes.

Capsules Propadrine Hydrochloride, 3/8 gr., in bottles of 25 and 500. (Also used for the symptomatic control of hay fever and asthma.)

it in the eastern journals, to have been a marked success. The program was certainly enormous enough to satisfy the most greedy, and to furnish anyone, with surgical yearnings, enough material for long and careful thought. It has been suggested that the surgical congress be invited to meet in San Francisco in 1915, but when one considers the program offered at the last meeting, and the paucity of clinics and clinical material to be demonstrated in San Francisco, it would almost seem to be an excess of temerity even to suggest such a thing, no matter how greatly we might desire to be the hosts of the surgical congress. Just what congresses or conventions will be held in San Francisco in the exposition year, it is not possible to say. The American Medical Association will be invited to meet

The CAPTAIN SAVES THE SHIP

DIGIFOLINE "Ciba"

Just as stern measures are demanded to quell panic aboard ship, so is a dependable form of digitalis required to control the mutinous heart when rhythm runs amuck.

DIGIFOLINE, "Ciba"—containing all the cardio-active glucosides of digitalis leaf, and free from inert or undesirable substances—is assayed by the Hatcher and Brody Method to assure uniform effectiveness.

Your patients will appreciate the reduced price of DIGIFOLINE, "Ciba",—the tablets now cost just half as much as formerly.

there, and a committee of the Association has suggested that a large congress of those interested in hygiene, preventive medicine, tropical diseases, etc., be held in connection with the exposition. What will be the outcome of this proposition remains to be seen; of course the Association cannot decide until 1914 the place of meeting in 1915, but at the present writing there seems to be a certain feeling of willingness to come to San Francisco at that time.

* * *

Bohanon Amendment Unconstitutional.—The legislature, two years ago, passed an amendment to the California medical law which was signed by the governor on the last day of statutory grace. This amendment compelled the board to issue a license to anyone practicing a specialty, provided he had practiced it for thirty-five years and in California for fifteen years. In other words, it licensed anyone who had broken the laws of the State for fifteen years to keep on with the work that was originally illegal! Bohanon, a cancer "specialist" of Oakland, applied, with several others, for a license under this amendment. The Board of Examiners denied the application and he took the case into court where the law was decided to be unconstitutional. He will, in all probability, take the case to a higher court unless the present legislature passes another amendment designed to fit his particular case.

* * *

Widely Distributed Interest.—It has been a matter not only of great interest, but of some small pleasure to note the widely distributed territory in which the *Journal* seems to be of enough interest to be fairly well read—or looked through. A few copies go into nearly every state in the United States, and some to England and Europe generally. At least one reader in every state in which the *Journal* circulates, has written to us asking for the "collection stickers" (devised by Secretary Kress of the Los Angeles County Medical Association), to which attention was called in the September issue; two or three requests have come from England and Canada, and the following postcard was recently received from a reader in Germany: "You would much oblige us by sending us a set of 'stickers' as mentioned in the *State Journal.*" Even our advertising pages seem to be worth the attention of a good many who receive the *Journal*; they are readers who are up-to-date; no one can be up-to-date, in these days, unless he pays attention to the advertising pages of the reputable publications that pass through his hands.

From an article on "The Milk Supply of San Francisco and Its Bacterial Content." By E. E. Hutshing, Ph.C., San Francisco, Bacteriologist with San Francisco Board of Health.—Of the various classes of milk, shippers, wagon, creamery, depot, etc., of which samples are taken by the Health Department's inspectors to be submitted to its laboratories for examination, only the first-named is regularly put through the routine bacteriological examination. By shipper's milk is meant that which comes direct from the source of supply, namely, the dairy.

From an article on "Postoperative Acidosis," by Charles G. Levison, M.D., San Francisco.—In former years, when chloroform was in general use as an anesthetic, conditions at that time called uremia, secondary shock and latent sepsis were frequently observed. With the introduction of ether, however, these conditions have been less frequently seen. The untoward effects of all anesthetics during the past ten years have been steadily growing less as a result of the following factors:

1. The large reduction in the quantity of the anesthetic consumed on account of the drop-method, plus nitrous oxid, morphin, scopalamin and novocain.

TWENTY-FIVE YEARS AGO

(Continued from Page 16)

2. Shorter duration of operation.
3. A shorter period of preliminary starvation and purgation.

From an article on "Epidemic Poliomyelitis," by Philip King Brown, M.D., San Francisco—Historically, there was no special importance attached to this disease until its significance as a contagious epidemic disorder was emphasized in recent years. That it has existed endemically, but infrequently, in all parts of our land was apparent, but that it should become an almost national problem was due solely to the appreciation of its epidemic character. In this rôle it comes close home to us, and especially to you residents of this valley, since the first epidemic of the disease in this State, and the third recorded in America, occurred in June, 1898, at La Grande, not more than twenty miles distant. To Newmark's service in the San Francisco Polyclinic, two of the affected children were brought, and from the history obtained it seemed that other similar cases had occurred.

From an article on "The Diagnosis of Tuberculosis of the Skin," by D. Friedlander, M.D., San Francisco.—In the diagnosis of tuberculosis of the skin, we are confronted with a difficulty that we do not have to contend with in the gross pathological conditions of the same process in other organs of the body, inasmuch as we have, in tuberculosis of the skin, a variety of lesions which differ widely clinically, depending on the duration, intensity and evolution of the process, as well as the results of treatment. Not only in the clinical appearance does this wide variation occur, but also in the histological picture do we find the greatest latitude.

From an article on "Transfusion," by N. H. Chamberlain, M.D., Oakland.—Although, in the broader sense, transfusion includes the introduction of any fluid into the body, even saline solutions, we will use the word only to mean the causing of flow of blood directly from the vessels of one human being into the blood vessels of another.

From some News Notes from Newspapers:

Dr. Henry S. Orme, one of the oldest members of the State Society, died in Los Angeles on November 30, 1912. An obituary notice will appear in a later issue.

The State Commission on Tuberculosis (its chairman, Dr. George H. Kress, presiding), held a meeting in San Francisco on the 14th of December, preparatory to making its report to the next legislature.

"Dr. Albert Abrams of San Francisco," says the *Examiner*, "has succeeded in procuring the convention of the American Association of Spondylotherapy for 1915." Fine! That means that Doctor Abrams has procured himself for 1915.

Dr. E. O. Sawyer, county health officer of Los Angeles County, was given a banquet—and a gold badge—by many physicians and friends, on November 22. Los Angeles is certainly to be commended for its high development of the banquet idea.

Dr. O. D. Hamlin, who acquired a game knee while East last summer, has invented a new way of shooting ducks. He sits on a piano stool, in a blind, and thus orientates himself to correspond with the migratory duck with the least amount of effort and personal disturbance.

TWENTY-FIVE YEARS AGO

(Continued from Preceding Page)

Mr. Hubert T. Morrow, our attorney for Southern California, has been delivering a number of public lectures on the "Fight Against Criminal Practices." It is to be hoped that he can arouse some little interest on the part of the laity, for unless the layman wants these laws enforced, they will be dead letters.

Los Angeles has many very fine characteristics, not the least of which is its firm belief in the beneficial effect of banquets. On December 13, some eighty physicians of that community tendered a banquet to Dr. E. R. Smith upon the occasion of his retiring from active practice. Dr. H. Bert Ellis was the chairman, and Dr. Norman Bridge the toastmaster.

The Fresno *Mirror,* referring to abortionists and their use of the advertising pages of newspapers, makes this ingenuous remark: "We suggest that the next legislature pass a law making it a felony for newspapers in this State to publish the advertisements of such doctors and drug concerns." Bless you, dear *Mirror,* don't you know that such bills have been presented in nearly every legislature for twenty years, and have been defeated—by the newspapers? They want the dirty money.

Red Water Masses Caused by Mussel Poison Organism.—The appearance of spectacular patches of red water in the ocean off Central California, coupled with a simultaneous incidence of twenty-one cases of the dread mussel poisoning, has occasioned a sharp acceleration of the campaign being conducted by the State health authorities and the University of California Medical School against the spread of such poison cases. The discoloration of the water was created by the presence of masses of the goniaulux microörganism, which has been positively identified as the carrier of the poison. It was the first time in thirty years that this phenomenon has been noted in the ocean north of Southern California beaches, where the same is caused for the most part by microörganisms which are free from the poisonous substances.

At once, on the appearance of the goniaulux masses, quarantines were placed on mussels and clams in California, as it was found that the poison had spread to some of the latter bivalves. It was the first time on record that the clams of the region were found to be hosts of the poison organism.

The twenty-one victims recovered, but the condition of at least one of the patients was critical for several days. Upon learning of the situation the State Department of Health, coöperating with the Hooper Foundation of the University, placed an immediate ban on the sale of all mussels and clams, and sent out sharp warnings to all health officers along the Coast. Water samples along the Coast have been ordered, and if these show no further evidence of the destructive organism, the quarantines will be lifted.

The goniaulux are active between May and September, and thereafter seem to decrease greatly in numbers and to become impotent, in so far as their poison activities are concerned. The organism is ingested by mussels and by certain types of clams, lodging in the intestines and liver. It is destroyed by boiling in a bicarbonate of soda mixture, and may easily be removed by the elimination of the dark portions of the bivalve meat.

BOARD OF MEDICAL EXAMINERS

(Continued from Text Page 72)

lacking every qualification to practice medicine. The ones risking 'treatment' by charlatans seem to be in a class with those who give gypsies their money for planting to grow gold." (Santa Rosa *Press-Democrat,* November 12, 1937.)

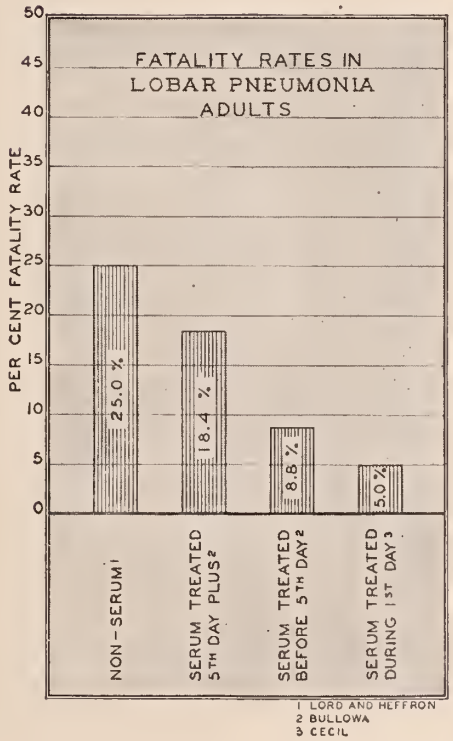
Records indicate that last year 10,853 students took the mental aptitude test furnished by the Committee of the Association of American Medical Colleges to students anticipating entering medical colleges.

"Dr. John E. Baker, former Receiving Hospital surgeon, convicted of grand theft for participation in a 'fake accident ring,' this week was sentenced to San Quentin Prison by Superior Judge Frank M. Smith, who denied his application for probation. Counsel for Doctor Baker, after a motion for a new trial had been denied, filed notice of appeal. Judge Smith ordered that Doctor Baker's time on the two counts of grand theft and conspiracy, carrying from one to ten years each, run concurrently." (Huntington Park *Bulletin,* November 8, 1937) (Previous entries, April, July, September, 1937; December, 1928.)

". . . Facing trial next week for participation in the fake accident ring and for assertedly conspiring to solicit injury cases, contrary to law, are eight physicians. Each is charged with conspiring with white lawyers. Those indicted awaiting trial are: Doctors E. B. Liddell, M. C.

(Continued on Page 22)

Early serum treatment saves lives in



PNEUMOCOCCUS LOBAR PNEUMONIAS

The serum treatment of pneumonia is an emergency procedure. Delay may mean failure. Those physicians who have in mind where they can obtain prompt typing tests and a quickly available supply of specific serum are thereby assuring their patients the best chance for recovery and the shortest possible period of illness.

When adequate serum treatment is given early, lives are saved and complications prevented. When serum treatment is postponed and used only as a measure of last resort, it may occasionally prove effective, but it has often failed.

Bacteremia, a serious development, occurs with considerably less frequency in cases where early, adequate serum therapy is instituted.

Bacteremia appears at varying times in the course of the disease, but usually after the third day.

Bullowa* has presented the following significant facts concerning bacteremia in Type 1 and Type 2 pneumonias:

> In non-serum treated cases, the incidence of bacteremia is 25% in Type 1 and 43% in Type 2. The mortality in each of these bacteremias is close to 75% if serum is not used, and considerably lower when serum is used.

The importance of immediate typing, even at the first suspicion of pneumonia, cannot be overemphasized.

*BULLOWA, J. G. M.: "The Management of the Pneumonias" Oxford University Press, 1937.

LEDERLE'S *"Directory of Pneumonia Typing Stations" will acquaint physicians with the nearest typing facilities in their localities. A copy of the booklet will be sent upon request.*

(Continued from Page 20)

Cooley, J. E. Porter, R. S. Whittaker, A. L. Wallace, C. D. Fredericks, R. B. Bledsoe, and W. B. Humphreys." (Los Angeles *Eagle,* November 11, 1937.)

"Jail sentences, fines and orders to make restitution were meted out yesterday in Superior Court to seven men and four women, members of a group of more than a score involved in a powerful 'fake accident ring,' which assertedly defrauded insurance companies out of thousands of dollars. All the defendants, except Dr. Frank Pearl, Negro physician, had pleaded guilty to various charges of grand theft, conspiracy and soliciting bribes, and appeared before Superior Judge Frank M. Smith seeking probation. . . . Doctor Pearl stood trial and was convicted of two counts of bribe solicitation. Evidence showed he bandaged and treated 'accident victims' who had no injuries and conspired with them to collect insurance money. Doctor Pearl was given a one year jail sentence and placed on ten years probation. Ten confessed they had entered into the insurance fraud conspiracies through the persuasion of George Dorris and Joseph Bone, who confessed to being the 'brains of the ring' and who are awaiting probation hearings with a score of other defendants. . . ." (Los Angeles *Daily News,* December 3, 1937.)

"Mrs. Adrienne Udstone, one of three defendants in Oakland's insurance 'racket' trial, took the witness stand yesterday to testify she was a victim of circumstances. Victim of the accident which was allegedly post-dated by Emile Grossman and Dr. Louis Kameny in an asserted effort to defraud an insurance company, Mrs. Udstone denied falsifying the date of the accident. She merely followed Doctor Kameny's suggestion to collect insurance on the accident because of its serious nature, she testified. Mrs. Udstone was assertedly burned in the beauty shop operated by Mrs. Anna Boggs in Oakland. Doctor Kameny previously testified he had urged collection of insurance on the burn and had altered the accident date on Grossman's suggestion. The prosecution contends the accident occurred previous to the date when insurance was taken out by Mrs. Boggs, that the trio of defendants conspired with her to set the date at a time after the policy was taken out. Trial is in Alameda County Superior Court of Judge Lincoln S. Church." (San Francisco *Examiner, East Bay Edition,* November 30, 1937.)

"In a surprise move, Dr. Ralph W. Bledsoe, well-known local physician, entered a plea of guilty Monday to a charge of soliciting the commission of grand theft, a felony, when he appeared with his attorney, Lloyd C. Griffith, in Judge Frank Smith's court. He was permitted to file an application for probation, which will be heard December 2. The charge grew out of the physician's asserted participation in an alleged fake accident ring. . . ." (Los Angeles *Sentinel,* November 18, 1937.)

"Dr. Leonard H. Larsen, '33, sailed for Spain October 20 to serve as physician and surgeon under the auspices of the Medical Bureau to Aid Spanish Democracy. He accompanied Dr. Edward Barsky, Chief of American Hospitals in Spain." (Stanford University *Illustrated Review,* November, 1937.)

The eyesight swindlers are gradually meeting well deserved punishment since the United States Post Office Inspectors have taken a hand in their procedure. Reports indicate that Frank Mackett, Jr., Attorney-at-Law, Milwaukee, was convicted on November 18, 1937, at Norfolk, Virginia, on a charge of fraudulent use of the mails in connection with the swindling of Miss Roberta M. Ridley of Boykins, Virginia, and was sentenced to a term of three

1 teaspoon	15 cals.
1 tablespoon	60 cals.

The final test of the adequacy of a feeding is the response on the part of the infant. It is frequently necessary to give a milk mixture of a considerably higher caloric value than anticipated.

The giving of food of too low a caloric value to meet the infant's needs is usually the chief cause of failure in infant feeding. The energy requirements may be met by Karo added to the type of formula indicated.

For further information, write
CORN PRODUCTS SALES COMPANY
Dept. S J-1, 17 Battery Place, New York, N. Y.

★ **Infant feeding practice is primarily the concern of the physician, therefore, Karo for infant feeding is advertised to the Medical Profession exclusively.**

For Hernia . . .

When you refer a patient to M. J. Benjamin you are assured that a support will be carefully made according to sound principles backed by two generations of experience.

Shaping each pad to conform to the hernial region permits the covering of a broader surface and the use of softer material.

Our work is guaranteed to meet with your approval and your patients' satisfaction.

BOARD OF MEDICAL EXAMINERS

(Continued from Page 22)

years. The records show that Mackett was previously convicted in Milwaukee and sentenced to a term of seven years and a fine of $2,000; however, the Court of Appeals set that verdict aside.

Matthew O. Wilkinson, eyesight swindler, who has operated in California and throughout the United States, is reported to have died at the Virginia State Prison Farm, November 4, 1937. (Previous entries, June and November, 1932; February, 1933; September, 1936.)

"Mrs. Edna G. Seward, operator of a local establishment for the cure of alcoholics, made it plain to Police Judge William J. Carraghar today she had found her most stubborn case. It was her husband and former partner, Ezra. Mrs. Seward testified as the complaining witness against him on a disturbing the peace charge. 'I tried everything to cure him, but nothing seemed to work as it did on other patients,' she said." (Associated Press Dispatch, dated Sacramento, November 16, printed San Francisco *Examiner,* November 17, 1937.) A similar report came to us some time ago regarding the manager of a well advertised treatment for alcoholism.

"Federal Judge A. F. St. Sure yesterday ordered condemned and forfeited to the government eighty-five pint packages and sixteen one-gallon bottles of elixir of sulfanilamide, after the required proclamation provided for seizures had been read in court. The deadly liquid had been taken from the warehouse of a local wholesale druggist. Despite the dangerous qualities of the elixir, the government, because of Drug Act restrictions, was forced to base its seizure on mislabeling. . . ." (San Francisco *Chronicle,* November 13, 1937.)

"Dr. Edward Peters, practicing Chiropractor of East Los Angeles, entered a plea of guilty to charges of violating Section 17 of the State Medical Practice Act of California and will come up for hearing on probation and sentence on November 16 in Whittier Justice Court. Doctor Peters, who pleaded not guilty and asked for a jury trial on October 15, last, was arrested on October 14 in Montebello Gardens, where it is alleged he carried on the practice of a physician without proper license." (Whittier *News,* November 4, 1937.)

"Dr. Max Hickok today was condemned to San Quentin prison. 'Five years to life' was the sentence imposed by Superior Judge J. J. Trabucco. The San Francisco chiropractor, convicted of second degree murder for the death of Mrs. Elizabeth Sowers, Oakland housewife, following an illegal operation, heard sentence pronounced without a flicker of an eyelash. But, back in his cell at the city prison, he broke completely. He sobbed half hysterically as he buried his face in his hands. At least ten days will elapse, however, before he must leave for San Quentin. His attorney, Alexander Mooslin, was granted a stay of execution of sentence in order that he might perfect an appeal. Previously his motion for a new trial had been denied. . . ." (San Francisco *Call-Bulletin,* December 1, 1937.)

"Trial of Mrs. Annabell McLellan, forty-one, and Mrs. Lucille Bouton, fifty-six, on illegal operation charges today was continued until January 5 by Superior Judge Edward J. Tyrrell. The continuance was granted when prosecutors from the district attorney's office sought to dismiss similar charges against Dr. Gordon McLellan, who committed suicide in his East Oakland home the day he was to have gone to trial. . . ." (Oakland *Post-Enquirer,* November 30, 1937.) (Previous entries, July, August, October, 1937.)

(Continued on Page 26)

For Children's Colds

In prescribing 'Benzedrine Inhaler' for children's head colds, you are providing a first aid remedy which may prove of constant service.

At the first sign of a cold the child is instructed to use the inhaler. Since benzyl methyl carbinamine is volatile, it penetrates to areas not readily accessible to liquid inhalants, and there is no oil to be aspirated and become a potential source of later trouble by accumulating in the lungs. (Graef—Am. J. of Path., Vol. xi: No. 5, Sept. 1935.)

For the adult members of the family, 'Benzedrine Inhaler' is equally useful.

Each tube is packed with benzyl methyl carbinamine, .325 gm.; oil of lavender, .097 gm.; menthol, .032 gm.

'Benzedrine' is the trade mark for S. K. F.'s nasal inhaler and for their brand of the substance whose descriptive name is benzyl methyl carbinamine.

A VOLATILE VASOCONSTRICTOR

SMITH, KLINE & FRENCH LABORATORIES, PHILADELPHIA, PA. • EST. 1841

LIVERMORE SANITARIUM

• The Hydropathic Department devoted to the treatment of general diseases excluding surgical and acute infectious cases. Special attention given functional and organic nervous diseases. A well equipped clinical laboratory and modern X-ray Department are in use for diagnosis.

• The Cottage Department (for mental patients) has its own facilities for hydropathic and other treatments. It consists of small cottages with homelike surroundings, permitting the segregation of patients in accordance with the type of psychosis. Also bungalows for individual patients, offering the highest class of accommodation with privacy and comfort.

GENERAL FEATURES

1. Climatic advantages not excelled in United States. Beautiful grounds and attractive surrounding country.
2. Indoor and outdoor gymnastics under the charge of an athletic director. An excellent Occupational Department.
3. A resident medical staff. A large and well trained nursing staff so that each patient is given careful individual attention.

BOARD OF MEDICAL EXAMINERS

(Continued from Page 24)

"Suit for $1,250 damages was filed in Municipal Court yesterday by Mrs. Alma Roberts, radio station broadcaster, against J. Douglas Thompson, Oakland chiropractor. The suit alleges that the defendant promised to pay one cent per item for radio advertising of Doctor Thompson's beauty aids, said to have a sale of fifty thousand monthly. The complainant asserted that the monthly sale with radio advertising was represented to her as 193 and that she accordingly was given a check for $1.93." (San Francisco *Chronicle,* December 2, 1937.) (Previous entries March, 1928; February, March, April, July, 1936.)

"Suddenly dropping his move to fight a charge of violating the State Medical Act, R. B. Hartman, former San Bernardino chiropractor, pleaded guilty in justice court today and asked probation. Hartman, who will be released tomorrow from the county jail after serving 180 days for a similar conviction, will appear before Justice Russell A. Wickizer at 10:30 a. m. Tuesday for his probation hearing. Hartman pleaded guilty to practicing medicine without a license and admitted he gave medical treatment to a woman who was suffering from cancer. The woman was admitted to the county hospital where ten days later she died. Twice before Hartman has been convicted of medical act violation charges, once by a jury and the other time by the court. . . . Last January, Hartman was convicted of two charges of violating the state act and sentenced to 180 days in the county jail. He carried his fight for reversal of the verdict through the Superior, Appellate, and Supreme courts. Early in 1936, Hartman was convicted of similar charges and paid a fine of $180. After his conviction, the State Board revoked his chiropractor's license." (San Bernardino *Telegram,* November 26, 1937.)
"E. B. Hartman, former chiropractor, who was released from the county jail Sunday after serving 180 days for violating the State Medical Practice Act, was granted probation in the San Bernardino township court yesterday on a similar charge. Justice Russell A. Wickizer sentenced Hartman to serve 180 days on the last charge and suspended the term for two years on condition he does not violate any law in that period. Hartman pleaded guilty a week ago to a charge of practicing medicine without a license while he was at liberty pending appeals of his conviction of two charges of violating the State Medical Practice Act." (San Bernardino *Sun,* December 1, 1937.) (Previous entries, July, September, and November, 1935; January, March, April, 1936; August, November, and December, 1937.)

"Denial that he ever had authorized Henry Santrey to announce his candidacy for lieutenant governor at a meeting of the Exchange Club was made by Dr. Frank Nolan, Hollywood physician, (licensed by the Osteopathic Board), in a deposition on file today in the Municipal Court in the suit brought by Santrey and Guido Orlando to collect $2,000 for campaign services. The plaintiffs charged Doctor Nolan owed them the money for work they performed as campaign sponsors for his proposed candidacy for the lieutenant governorship. . . ." (Los Angeles *Herald and Express,* November 29, 1937.)

"Lowell W. Bird, forty, electrotherapeutist, who pleaded guilty before Municipal Judge Dean Sherry to practicing medicine in a downtown office building without a state license, today was serving a sixty day sentence in the county jail. Bird was arrested and charged with violation of the State Medical Practice Act following investigation of his activities by W. N. Anderson, inspector for the Board of Medical Examiners, who testified Bird ministered inadequately to several service men who came to him for treatment. Complaints from navy executive officers and the San Diego Better Business Bureau brought Anderson here to investigate the 'physician,' testimony revealed." (San Diego *Tribune,* November 26, 1937.)

TO THE DOCTOR'S WIFE

•

It is our conviction that cosmetics should be selected to suit the individual's requirements. We cater exclusively to you, the individual. Our representatives are trained to help you select suitable beauty preparations and to show you how to apply them.

It is only sensible to realize that a truly beautiful skin is first of all a healthy skin and secondly a well-cared-for skin.

Cosmetics serve to enhance your appearance, to present you at your best. In this regard it is well to bear in mind that a natural appearance is by far the most charming.

Carefully selected, and artistically applied, make-up preparations lose their identity as cosmetics and become an indistinguishable part of your personality.

We want it clearly understood that we in no way undertake to treat skin disorders. If you are thus afflicted we had rather that you not use our preparations without the consent of a skin specialist. Our formulary is available to the medical profession.

A card addressed to us will be referred to the manager of the territory in which you reside. It is our pleasure to be at your service.—LUZIER'S, Inc.

Beauty Preparations by Luzier

KANSAS CITY, MISSOURI

"A former Chicago physician appeared yesterday before United States Commissioner Ernest E. Williams, charged with violation of the Harrison Narcotics Act. He is known as Dr. John H. Trowbridge, forty-nine, reputed member of a prominent Beverly Hills family. He waived reading of the charges, indicated he would plead guilty as he twice before has pleaded guilty to Harrison Act violations." (San Francisco *Examiner,* December 4, 1937.) The name of John H. Trowbridge is not shown in the 1936 American Medical Association Directory, published by the American Medical Association.

"Three of four convicted members of a coastwide abortion ring yesterday were successful in winning new trials from the California Supreme Court. Rehearing of the cases against Valentine St. John, James Beegs and Jesse C. Ross was ordered on the grounds that a 'dearth of corroborating evidence' is apparently in the record of the trial before Superior Judge Arthur Crum of Los Angeles. A new trial, however, was denied a fourth appellant, William A. Byrne. Byrne attacked the indictment against him on technical, not evidentiary grounds. In all, twelve were convicted by the Los Angeles court. . . ." (San Francisco *Examiner,* November 27, 1937.)

"Warrants charging a Chicago doctor with criminally assaulting a fifty-year-old spinster as she lay on his operating table under the influence of a sedative were issued today against Dr. Jean Paul Fernel, a plastic surgeon. The warrants were issued on the complaints of Miss May Morrill, Worcester, Mass., spinster, who said she came here from the East, with her sister, Catherine, forty, to undergo facial beautification. The two Morrill sisters told the court of a harrowing tale of being imprisoned in Doctor Fernel's Michigan Avenue suite until they allegedly succeeded in escaping yesterday. Both appeared in court with bandages and scars, which they charge were the result of the surgeon's facial operations. . . ." (Press dispatch dated Chicago, November 27, printed San Francisco *Examiner,* November 28, 1937.) (Previous entry, October, 1927.)

"Facing charges in this city of violating the Medical Practice Act and petty theft, 'Dr.' Roy Cain, forty-nine, saw troubles piled higher for him with the receipt by the police of another warrant. The warrant from Berkeley was issued on a complaint which also charged petty theft. . . . The first two charges are declared an outgrowth of his prescribing for a local resident as a Chiropractor, without a license to so practice. Filing of the theft charge followed his allegedly obtaining a quantity of gasoline from a service station here and failing to pay for it. The Berkeley charge also was filed by a service station man, who alleges Cain gave him a worthless ring, claiming it was valuable, for a quantity of gasoline. It was reported Cain had been an inmate of Leavenworth, San Quentin, and Folsom prisons. Later check showed this also to be an error. He had been only in Leavenworth and Folsom. The Leavenworth term came as the result of a conviction in an Army Court desertion and escape from custody. The term in Folsom was served after conviction on a charge of issuing worthless checks. . . ." (Stockton *Record,* November 19, 1937.) ". . . Yesterday afternoon, after a hearing before Superior Judge D. M. Young, Cain was committed to the State Hospital. . . . " (Stockton *Record,* December 3, 1937.)

"Warning to all doctors against stock salesmen who claim ability to throw them compensation medical cases was given today by Clark B. Day, manager of the State Compensation Fund. Mr. Day has received reports that salesmen are approaching doctors with the whispered word that they have an inside track to the Compensation Fund." (San Francisco *News,* December 6, 1937.)

APPROVED CLINICAL PATHOLOGISTS

American Medical Association Essentials for An Approved Clinical Pathologist

An approved clinical pathologist should be a licensed graduate of medicine. He shall have specialized in clinical pathology, bacteriology, pathology, chemistry, and other allied subjects for at least three years, and he should be reasonably familiar with the manifestations of disease in the body. The director of a clinical laboratory shall be on full time or have definite hours of attendance, devoting the major part of his time to this specialty. A clinical laboratory is an institution organized for the practical application of the fundamental sciences by the use of specialized apparatus, equipment and methods, for the purpose of ascertaining the presence, nature, source, and progress of disease in the human body.

The following Clinical Pathologists directing private laboratories in California are approved by the Council on Medical Education and Hospitals of the American Medical Association:

Clinical Laboratory of Drs. W. V. Brem, A. H. Zeiler, Roy W. Hammack and G. D. Maner, 657 So. Westlake Avenue, Los Angeles, California.

Zera E. Bolin, M. D., 490 Post Street, San Francisco, California.

These laboratories use standard methods and are fully equipped to make all clinical examinations of recognized value in: **Tissue Pathology, Bacteriology, Hematology, Serology, Bio-Chemistry, Kolmer, Wassermann, Kahn test, Medico-legal, Basal metabolism, Blood chemistry, Hormone Test for Pregnancy, Parasitology, Cardiology, Autogenous vaccines, etc.**

Mailing containers sent on request. Special delivery postage insures prompt, accurate service.

ACCEPTABLE TO FASTIDIOUS PATIENTS

NEO-SILVOL

Neo-Silvol (Colloidal Silver Iodide Compound) is particularly suited for use in eye, ear, nose and throat. It is antiseptic in action and has the added advantages of being non-staining and non-irritating. Even in 25 to 50 per cent solution Neo-Silvol will not injure delicate mucous membranes.

Ten to twenty per cent solutions of Neo-Silvol are suitable for most eye infections; gonorrheal ophthalmia may call for stronger solutions—25 to 50 per cent. In inflammatory conditions of the nose, naso-pharynx, pharynx and tonsils, Neo-Silvol (10 to 25 per cent strength) may be sprayed or swabbed on the involved areas three or four times daily. Neo-Silvol solutions are easily prepared by dissolving the glistening, cream-colored granules in water.

•

Supplied in six-grain capsules, packages of 50 and 500, and in 1-ounce and 1/4-pound bottles.

PARKE, DAVIS & COMPANY, DETROIT • *The World's Largest Makers of Pharmaceutical and Biological Products*

Not a New Year's Resolution, But...

The Lilly Code

in Practice Every Day for Sixty-One Years

1 To provide the profession with medicinal products of highest quality and unvarying potency.

2 To contribute to the progress of medicine by developing new and superior agents through research.

3 To issue information about the uses of the products of the company through professional channels exclusively.

EPHEDRINE PREPARATIONS, LILLY

● Since the original commercial development of ephedrine by Eli Lilly and Company eleven years ago, new uses for this important drug have appeared and suitable preparations of ephedrine have been made available for each new indication.

A thirty-six-page booklet describing these indications and listing Ephedrine Products, Lilly, will be sent to physicians upon request.

ELI LILLY AND COMPANY

CALIFORNIA AND WESTERN MEDICINE

OFFICIAL JOURNAL OF THE CALIFORNIA MEDICAL ASSOCIATION

VOL. 48 JANUARY, 1938 NO. 1

California and Western Medicine

Owned and Published by the
CALIFORNIA MEDICAL ASSOCIATION
Four Fifty Sutter, Room 2004, San Francisco, Phone DOuglas 0062

Address editorial communications to Dr. George H. Kress as per address above; advertising and business communications to Secretary-Treasurer, Dr. Frederick C. Warnshuis, also at above address.

EDITOR GEORGE H. KRESS

Advertisements.—The Journal is published on the seventh of the month. Advertising copy must be received not later than the fifteenth of the month preceding issue. Advertising rates will be sent on request.

BUSINESS MANAGER . FREDERICK C. WARNSHUIS

Advertising Representative for Northern California
L. J. FLYNN, 544 Market Street, San Francisco (DOuglas 0577)

Copyright, 1938, by the California Medical Association.

Subscription prices, $5 ($6 for foreign countries); single copies, 50 cents.

Volumes begin with the first of January and the first of July. Subscriptions may commence at any time.

Change of Address.—Request for change of address should give both the old and the new address. No change in any address on the mailing list will be made until such change is requested by county secretaries or by the member concerned.

Responsibility for Statements and Conclusions in Original Articles.—Authors are responsible for all statements, conclusions and methods of presenting their subjects. These may or may not be in harmony with the views of the editorial staff. It is aimed to permit authors to have as wide latitude as the general policy of the Journal and the demands on its space may permit. The right to reduce or reject any article is always reserved.

Contributions—Exclusive Publication.—Articles are accepted for publication on condition that they are contributed solely to this Journal. New copy must be sent to the editorial office not later than the fifteenth day of the month preceding the date of publication.

Contributions—Length of Articles: Extra Costs.—Original articles should not exceed three and one-half pages in length. Authors who wish articles of greater length printed must pay extra costs involved. Illustrations in excess of amount allowed by the Council are also extra.

Leaflet Regarding Rules of Publication.—CALIFORNIA AND WESTERN MEDICINE has prepared a leaflet explaining its rules regarding publication. This leaflet gives suggestions on the preparation of manuscripts and of illustrations. It is suggested that contributors to this Journal write to its office requesting a copy of this leaflet.

EDITORIALS†

A NEW-YEAR PRAYER OF TWENTY-FIVE YEARS AGO: BY PHILIP MILLS JONES, FOUNDER-EDITOR OF THE OFFICIAL JOURNAL OF CALIFORNIA MEDICAL ASSOCIATION

Dr. Philip Mills Jones.—Twenty-five years ago, in the *California State Journal of Medicine* (predecessor of CALIFORNIA AND WESTERN MEDICINE), appeared the Greeting for the year 1913, as penned by Dr. Philip Mills Jones, who had founded the Official Journal of the California Medical Association some ten years before. This New Year Prayer is again brought to light, and for several reasons: first, the thoughts therein expressed should have appeal for every physician who loves his profession, and their perusal should be an inspiration for continued service; secondly, it gives us opportunity to call to the attention of present-day members, who may not have known the late Dr. Philip Mills Jones, the splendid record of service and accomplishment he rendered to his beloved "Medical Society of the State of California" (the name by which the California Medical Association was then known); and lastly, because your present editor's early friendship with Doctor Jones permitted him to become intimately acquainted with a colleague who, like the late Dr. George H. Simmons, editor-emeritus of the *Journal of the American Medical Association,* through his broad vision and personality, left an indelible impress upon organized medicine in both his State and the Nation.

* * *

A New-Year Prayer.—We shall print first the New-Year Prayer, and then some excerpts from the pens of physician coworkers who tried to give expression to their regard and grief when, on December 3, 1916, during the influenza epidemic of 1916, death called Doctor Jones from his earthly labors.

* * *

Editorial Salutation in the January, 1913, Issue of the Official Journal.—The greeting in the *California State Journal of Medicine* of twenty-five years ago reads as follows:

†Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

A NEW-YEAR PRAYER

To all of our readers, Greeting! May the year deal kindly with you, and bring you much that is good and little that is of sorrow or trouble; may the spirit of peace and harmony prevail with you throughout the year, and may the mantle of jealousy drop from you as a rag that is worn out; may charity, justice, and brotherly love guide you always in your thoughts of, and your relations with your fellow practitioners of medicine; may it bring an end to bickerings and dissensions, and, departing, may the year leave with you a better-stored mind, contentment with yourself and your fellows, and the inward knowledge, from which comes peace of mind, of a twelvemonth of good, honest work, done with the very best that is in you, and to the betterment of at least a portion of mankind. Give of your time and your brains, the best you have to your medical society, that, in so giving, you may unselfishly help the entire medical profession and the people who are dependent upon it for health and protection; where there is an active and industrious medical society, there will you find good doctors and responsive and grateful patients. Let no word of idle slander or suppositious criticism of a colleague pass your lips; if you cannot speak well of a brother physician, speak not at all, for when you disparage another physician you hurt yourself as well, and the entire profession is belittled in the eyes of the people. May your interest in your medical society work increase with the passing months, and may the year close upon a more closely united and more intimately related medical profession, thus giving to the people of our State the very best medical supervision. May happiness be with you, one and all!

* * *

Tributes on the Occasion of Doctor Jones's Death.—In the October, 1937, issue of CALIFORNIA AND WESTERN MEDICINE, under the caption, "The Passing of a Great Editor: George H. Simmons, 1852-1937," editorial comment was made of the notable services rendered to the American Medical Association and its constituent units by Doctor Simmons. It may be added that all that was said of Doctor Simmons applies, in a general way, with equal force to Dr. Philip Mills Jones, and it is interesting and illustrative of the bigness of heart and outlook of these two men, who became pacemakers in medical journalism and medical organization work in America, that the surface antagonisms and warfare, which existed between them in their earlier years, gave place to a sincere and beautiful friendship when later opportunities permitted them to meet and work with one another; as happened in the many years when Doctor Jones represented California, not only as a member of the American Medical Association House of Delegates, but also as a member of the Board of Trustees of the American Medical Association.

* * *

An Unsigned Editorial.—Below appear first some lines from an unsigned editorial in the January, 1917, issue of the CALIFORNIA STATE JOURNAL OF MEDICINE, on the occasion of Doctor Jones's death:

DR. PHILIP MILLS JONES

"How few of us can do things that others cannot. Were you or I to die tomorrow, what difference would it make? . . .

"Work, that is the thing. And how few do work that others cannot; make things, do or write or say things that others cannot!

"It was strange to pass the State Society's offices; they had that look of the unknown that sudden and shocking events impart to the most ordinary and intimate objects. To hear a typewriter rattling and to think of him who used to dictate—to see files and stacks of letters, malpractice suits and judgments coming in, and to think of him whom they used so vitally to interest. To think that he had woven the JOURNAL, the Medical Defense, and all he had done to bring the profession together, to think of questions critically concerning them, and of what they meant to him—and to us—his work lying undone, and he caring no longer.

"Doctor Jones will be missed. Who is there to do his work? to combine law and medicine and organization talent; to bring to them an even and justly balanced intelligence, industry, and a knowledge of dealing with men.

" 'To be honest, to be kind'—yes—but more than that—'Work while it is called Today; for the Night cometh wherein no man can work.'

"The Night hath come, and we are groping for a guide."

* * *

Tribute from the Late Dr. Harry M. Sherman.—The quotations which follow are taken from a tribute written by the late Harry M. Sherman, beloved physician-surgeon of San Francisco, who in both the years 1914 and 1915 was president of the California Medical Association, sharing that honor of a two-year service with the late Dr. R. F. Rooney of Auburn (president, 1904 and 1905). Read now what Harry Sherman wrote of Doctor Jones's work in cleaning the pages of medical journals of two and three decades ago of off-color advertising, and of bringing about other reforms in organized medicine:

DR. PHILIP MILLS JONES

"It is still a strange thought to me that I have outlived Philip Mills Jones. In the little transient thought that I ever gave to the matter it was natural to think of him as sometime writing about me, dead—it seems almost unnatural for me to be writing about him, dead. . . .

"I came to know him and understand him best at and after this time of the starting of the JOURNAL. No one will doubt for a moment but that the JOURNAL as he left it to us, is the best criterion of the real Phil. Jones. It was never intended to be simply *a journal,* it was intended to be a particular kind of journal, and it has always been such. It has always had a distinct motive—has always followed a thought-out plan. Jones's interest in sociology has tinctured every word he ever wrote for it, and if one reads carefully it is easy to see it running through all his editorial paragraphs and articles. . . .

"Early in the history of the JOURNAL, that is, from 1903 to 1906—both inclusive—George H. Evans and I made, with Jones, a majority of the publication committee. Others who were on the committee with us varied from year to year, but the retention of us three during these four years made a continuous policy a practical thing. Our first big work was the reformation of the advertising methods of the medical press. I say "our first big work," taking to ourselves some of the glory, but Jones did all the writing, got all the obloquy and finally all the praise, while Evans and I merely backed and supported him. The crusade created much bitterness at first, and one famous editor was so much incensed at what was said about his journal that he would neither speak nor write to Jones, and when circumstances made it imperative that there should be some communication I was made the intermediary, the editor writing to me and I replying after consultation with Jones. This story would be most incomplete if I did not add that as time showed that the California contentions about advertisements were correct, the editor and Jones again became friends and were such to the end. It must be remembered that in this campaign Jones, actually single-handed and in a new journal with no established prestige, changed the advertising policy of every decent medical journal in the country; a great feat, for it cost many journals thousands of dollars to give up the profits of their reprehensible

contracts, and cull their advertisers as they did their contributors. . . .

"And then comes, in the December JOURNAL, his wish expressed to us for a Merry Christmas and a Happy New Year—and the jubilation that we are all alive, when he, dear man, is not—so that the wish—his last for us—comes to us, literally, from his grave, and we can all be most certain that, wherever the consciousness which we knew as Phil. Jones may exist, that wish is just as keen and living as it was on the day he wrote it for us to read it in this December."

* * *

California Medicine, scientific and organized, owes much to the late Dr. Philip Mills Jones* and the group of loyal officers and workers who, with him, laid the foundations for the California Medical Association of today, and Doctor Jones's "New-Year Prayer" of twenty-five years ago still applies with equal and even more force. CALIFORNIA AND WESTERN MEDICINE presents it in the hope that its warmth of feeling and breadth of outlook may be taken to heart, by each and all of us; for then, at the end of the year 1938, no matter what trials and tribulations may have come to us, we shall still remain stronger and better units in organized medicine.

WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION: ITS PUBLICATION, "CALIFORNIA MEDICAL AUXILIARY COURIER"

Woman's Auxiliary Department of "California and Western Medicine."—Each issue of CALIFORNIA AND WESTERN MEDICINE presents, as one of its departments, "The Woman's Auxiliary to the California Medical Association," and we hope that the reports therein submitted are read not only by members of the Auxiliary, but by the California Medical Association members as well. It has been most interesting to note during the last several years, not only the steady growth of the Auxiliary through organization of new units, and consistent gains in membership in county auxiliaries already established, but also the record of increasing scope of work and influence.

* * *

Active Medical Practice Makes for Certain Limitations.—Let us be frank with ourselves. The responsibility of administrative endeavor in medical societies necessarily falls on the shoulders of a few members, the tendency being to let the physicians so elected or appointed bear the brunt of solving the problems so constantly coming to the front. In days gone by, with less social unrest than at present, the demands upon county medical society officers were not over-great, being limited at times to little more than preparation of programs for a certain number of scientific meetings to be held throughout the year. That condition, however, no longer obtains. Out of the air, almost, now come constantly new propositions to be faced, put forward sometimes, by well-meaning but poorly visioned organizations, but at other times, not infrequently, advanced by groups ill-intentioned from the outset toward the standards and advancement of scientific medicine and the public health. In short, the old order has changed, and it needs no deep study to convince an observing person that present-day menaces to scientific medicine will only be successfully overcome provided all members of the medical profession, as represented in organized medicine, and with the support of friends, will stand shoulder to shoulder, and give battle to those who, under whatever flag, would destroy medical practice as it has come into being through an evolutionary trial and error process. Granted that among the plans of theorizing visionaries and propagandists there may be here and there somewhat of merit, it still remains true, and is common sense, that in order to incorporate changes to overcome certain deficiencies in medical practice, it is not necessary and would be reprehensible to attempt reforms by revolutionary procedures that, in the end, would do more harm to public health interests than the good they were intended to or might bring into being.

* * *

Present-Day Turmoil of Economic and Social Unrest.—In the unsettled state in which the Nation is now trying to solve some of its economic and social-welfare problems, the theorizing propagandists have precisely the conditions favorable to the dissemination of their mouthings. To appreciate this, one needs only to glance through the newspapers and read between the lines, and observe how different is the portrayal of current news events than was the case a few years ago. The "free and independent press" of the present hour—believe it or not—watches, with keen eye, the trend of popular opinion, and, in contrast to days gone by, speaks kindly of this, that, or the other endeavor, when, not so long ago, the same matters would have received almost caustic editorial and reportorial criticism and comment.

* * *

The Lesson to Be Taken to Heart.—What is the lesson in all this, and what has it to do with the Woman's Auxiliary to the California Medical Association? Just this: Scientific and Organized Medicine need today every bit of their strength to successfully cope with the antagonistic influences directed against public health and medical practice. Most physicians, in the daily practice of their profession, have little time to sit in at service and other clubs where antimedical propagandists hold forth. Since, however, practically one-half of all clubs are women's organizations, it is understandable how representatives of the Woman's Auxiliaries to the California Medical Association, whose members take an active interest in the work of their literary, service and other clubs, can render most important aid in guiding aright, on public health and medical practice needs, the policies of such organizations.

* * *

State and County Auxiliaries in California Are on the Alert.—A perusal of the activities of the California county society auxiliaries, as given in each issue of the OFFICIAL JOURNAL, convinces one that the wives and daughters of California physicians are becoming increasingly

* For biographical data from *Journal A. M. A.* of December 2, 1916, see page 60 in this issue of CALIFORNIA AND WESTERN MEDICINE.

responsive of their own responsibilities in these matters. And it may be said, to their credit, that they are more than meeting their obligations. Wherefore, we welcome the messages brought to us in their semiannual publication, the *California Medical Auxiliary Courier,* and express the hope that, at some day not too far distant, the State Auxiliary will present to the California Medical Association Council for consideration, ample copy for a Supplement to CALIFORNIA AND WESTERN MEDICINE, in order that every member of the California Medical Association may note for himself what the gentler members of physicians' families are doing to promote the conservation of the public health and the advancement of medical science. If the California Auxiliary will continue to work in the future with the splendid discretion it has exhibited in the past, there must come to us all the wish that in due time—and not too far away—every county medical society of the California Medical Association will have associated with it a component county unit of the Woman's Auxiliary to the California Medical Association. Speed the day!

THIS AND THAT

Congratulations to Dr. Joseph P. Widney, Founder of the Los Angeles County Medical Association, on Attaining His Ninety-sixth Birthday.—December 26, 1937, was the ninety-sixth birthday of Joseph P. Widney,* M.D., D.D., LL.D., founder of the Los Angeles County Medical Association; founder also of the College of Medicine of the University of Southern California; co-founder of the *Southern California Practitioner;* ex-president of the University of Southern California, where, in the panic of 1893, as president, he pledged his personal resources to prevent foreclosures on the University's property; oldest living graduate of the University of California (Toland Medical College, 1866); an exemplar of the highest type of citizenship as manifested through years of consistent service; and a writer and author of half a dozen notable volumes, who only a few months ago, at the age of 95, brought off the press his latest book, "Civilizations and Their Diseases, and Rebuilding a Wrecked World Civilization."†

The career of Doctor Widney, who was born on December 26, 1841, has indeed been most remarkable, standing out as it does among his medical colleagues and fellow citizens like a beacon light to be seen afar by all who would chart their lives along lines of service and achievement. A bronze bust of the founder graces the rostrum of the auditorium of the Los Angeles County Medical Association headquarters building, there to remind members of that large component county unit how splendidly a life may be devoted to the service of mankind, both for todays of the present and the tomorrows of the future.

We extend to Doctor Widney, therefore, on behalf of the 5,700 members of the California Medical Association, our best wishes for the good health and happiness he has so richly earned, and urge a perusal of his latest book, from which some paragraphs are given below, for sober reflection upon the code which he long ago mapped out for himself as his own guide in his life work:

"I have never written for money. The sole object has been the carving out of broader lines for the human race. For more than fifty years of careful historical study, I have thought, and planned, and worked to this end. This ultimate purpose has run through all my publications. I have not placed upon the public market the books which I have written. I had not the time for this in an overworked life, nor have I had the means. My works have been placed, instead, in the great public reading rooms, and libraries, and colleges and universities of the world, where they might find the largest number of readers. This has drained heavily upon my private resources, so much so that I must still go on in the same old way. It is my contribution to the uplift of humanity and the making of a better world, and with this I am content.

"I am near to the beginning of my ninety-seventh year. Owing to injuries received in an accident, I have had to do all my work under the heavy handicap of being crippled, and in blindness, and in pain. Every word that I have published, for many years, I have had to dictate. What this means in patience, in difficulty, in labor, only one who has gone through it can know.

"There is still much that I have planned. Following the book now in the press ("Civilizations and Their Diseases, and Rebuilding a Wrecked Civilization"), there must come as a separate volume the work on the future of the Engle Man ("The Future of the English-Speaking Peoples"), to which I have made reference; thereafter, a book on "Life and Its Problems as Seen by a Blind Man at Ninety- —?—" In addition, there is other work which I need not enumerate. I had planned for a century; but this is in the Hands of One to Whom the centuries are only as a work-day. His will be done.

"Domine ad Te oculos cæcos levabo!"

* * *

Professor A. W. Meyer's Article.—In CALIFORNIA AND WESTERN MEDICINE for December appeared several articles concerning which comment may be made.

In the original article section, space was given to the scholarly discussion entitled "Use Destruction in the Human Body," contributed by A. W. Meyer, M.D., professor of anatomy at Stanford University. The facts therein outlined, based as they are on extensive and careful observations covering many years, and which are called, in conservative and scientific manner, to the attention of members, will have appeal not only to readers of CALIFORNIA AND WESTERN MEDICINE, but also to students of the subject, both at home and abroad. The contribution is a welcome addition to the literature.

* * *

District of Columbia and "Liberal Press" Articles.—In each issue of the OFFICIAL JOURNAL is a department given over to Special Articles,

* For biographical and other references concerning Dr. Joseph P. Widney, see CALIFORNIA AND WESTERN MEDICINE, April and May, 1936, pages 292 and 396.

† Review of this volume in CALIFORNIA AND WESTERN MEDICINE for December, 1937, on page 367.

made up usually of a mélange of current-interest topics of such nature that physicians who desire to keep in touch with the trends in scientific medicine, disease features pertinent to California, or social welfare endeavors related to medical practice may find in their reading something worth while.

On page 433 of the December issue, for example, appeared an article, "United States Experiment in State Medicine Brings Protests," in which the story of what an agency of the Federal Government, the "Home Owners Loan Corporation—HOLC," is doing with public funds, by subsidizing, to the amount of twenty thousand dollars yearly, a coöperative clinic of federal employees. The HOLC maintains that it can thus use public funds to aid what in one sense is a private enterprise, because Congress, in order to permit the Home Owners Loan Corporation to do its major work, gave to that agency the status of a private corporation, vesting in its Board the legal rights of private corporations. It is stated that the District of Columbia Medical Association will take that issue into the courts, in order to have judicial opinion on whether public monies can be so used. The HOLC experiment is little other than an expression of state medicine, even though at the present time only two thousand employees are involved; and with comparatively little economic significance, perhaps, except as to principles involved. However, if the precedent so established were to be adopted by the many other federal agencies in Washington, D. C., with their thousands and thousands of employees, the matter would take on aspects of grave nature, not only to members of the medical profession at large, but to the entire tax-paying public of these United States.*

* * *

The "Liberal Press"—Excerpts from "The Nation" and "The American Mercury."—Readers who refer to the District of Columbia article may also be interested to peruse, on its opposite page, the item, "Two Articles of Interest in *The Nation* and *The American Mercury,*" in which quotations from those publications are given; *The Nation* excerpt being a good example of the bias which exists in publications of its type toward the American Medical Association, and its constituent state organizations and their component county units. It was a fortunate coincidence that *The American Mercury* of the same month contained a critical analysis of the publication, *The Nation,* and it may be in order to reprint here the last paragraph of the December excerpts, to call attention to opinions expressed by the contributor to *The American Mercury,* in which he emphasizes the menace to American standards and traditions inherent in the outpourings of certain "liberal publications." Whether we agree or disagree with the thoughts so expressed, the quotations as given in the December issue (on page 432) are still worth the time of perusal:

"Furthermore, it is probably accurate to say that, today, the *New Republic* and *The Nation* are the most effective amateur propaganda adjuncts to the American Communist movement. For the once liberal weeklies are, in a sense, the bridge between Communism and the unconvinced intelligentsia. Their 75,000 subscribers, by a process of natural selection, are vocational molders of national opinion. They are teachers, writers, clergymen, professional men and women, social workers—the picked middlemen of American intellectual life." . . .

* * *

"Public Health Liability Act—Proposed Initiative 29."—This is a proposed law known as Initiative 29, which suddenly came to the front when efforts were made to have the Public Health Committee of the Los Angeles Chamber of Commerce grant its approval to the measure. At this writing, we are still in the dark concerning its sponsors, both direct and indirect. However, who may or may not be the authors and promoters of the proposed law, for the enactment of which its sponsors are making an effort to have it placed, as an initiative measure, on state election ballots of 1938, is, in one sense, of minor concern at the moment. It is the viciousness and absurdity of the provisions contained in the proposed law that warrant its careful perusal by every licensed physician of California, and it is therefore printed in full, with some italicized phrases by the Editor, on page 66, in this issue of the OFFICIAL JOURNAL.

The proposed law, among other things, would make an error of judgment in diagnosis a crime; would destroy existing standards of healing-art practice; would make physicians guarantors of cures; would make patients' records public documents; would make hospitals (including charitable hospitals) and their nurses liable for the acts of physicians using such hospitals; and would define major surgery, minor surgery, practice of medicine, wrong diagnosis, and unnecessary major surgical operation in a manner which would effectively prohibit medical practice as it is now understood!

Members of the California Medical Association are requested to read this proposed initiative law and satisfy themselves concerning the nature of this stupid measure, which, in the interests of the public health and of scientific medicine, must be opposed wherever it may be presented for consideration.

The attention of the officers of the California Medical Association has been called to this most recent attack upon legitimate healing art practice. In the meantime, members of the California Medical Association are requested to be on the alert, and to forward any additional information to the central office of the California Medical Association.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 39.

* Note.—As the page proofs are about to go forward to the printer, we received a copy of a dispatch stating that the Acting United States Comptroller General had ruled the HOLC was without authority to loan $37,357.65 to the Group Health Association, Inc., of the District of Columbia.

EDITORIAL COMMENT†

EXPERIMENTAL RENAL HYPERTENSION

About ten years ago it was suggested by Farr[1] that the hypertension of Bright's disease is caused by renal ischemia secondary to nephrosclerosis. Doctor Goldblatt[2] and his coworkers of the Institute of Pathology, Western Reserve University, Cleveland, have devised an ingenious method to test this hypothesis, experimental renal ischemia caused by adjustable silver clamps placed about the main renal artery. The operation is performed retroperitoneally, with special instruments for the insertion and closing of the adjustable clamps. By this technique a "moderate" (30 per cent), "severe" (60 per cent), or "very severe" (90 per cent) reduction in renal circulation can be produced in experimental animals and maintained for several months or years.

Dogs, in which a "very severe" renal ischemia is so produced, show a rapid increase in systolic blood pressure, such pressure eventually reaching about twice the normal level. These animals soon show signs of renal insufficiency; urea nitrogen, nonprotein nitrogen and creatinin being increased in the blood stream. All animals with "very severe" ischemic kidneys die in about three weeks with typical manifestations of uremic intoxication.

Dogs, in which only "moderate" or "severe" bilateral renal ischemia is produced by this technique, usually survive the operation. Within from four to eight weeks a 100 per cent elevation in systolic blood pressure is usually noted, persisting with but slight change for at least fifteen months. Control experimental ischemias in other organs or parts of the body produced no significant hypertension in dogs. In the chronic renal hypertension the only subnormal renal function is a decreased "urea clearance"; blood urea, nonprotein nitrogen and creatin remaining within normal limits. The hypertension in these animals resembled that associated with so-called "benign nephrosclerosis" in man.

Two plausible explanations of the mechanism of renal hypertension were suggested by their findings: (1) a neurological theory, the assumption that afferent impulses from the nerve endings in the ischemic kidney to the sympathetic ganglia or vasomotor center might result in a general vasoconstriction and consequent elevation of systemic blood pressure; and (2) a hormonal theory, the assumption that the ischemic kidney gives off an unknown internal secretion, which by central or peripheral action causes a general vasoconstriction.

The neurogenic theory suggests that bilateral sympathectomy would prevent or cure renal hypertension. To test this conclusion, Doctor Goldblatt[3] and his coworkers excised the entire thoracic portion of the splanchnic nerves and the lower four dorsal sympathetic ganglion in four normal dogs, both sides being extirpated at the same operation. After full convalescence, renal ischemia was produced in these four dogs by their routine silver-clamp technique. In all animals typical hypertension developed in from four to eight weeks, and persisted for at least nine months, the animals being alive at the time of their report.

In a second group of dogs, renal hypertension had been produced from three to four years previously. Excision of the splanchnic nerves and lower four dorsal sympathetic ganglia caused no significant reduction in the renal hypertension in these animals. The authors conclude that "in dogs, excision of the thoracic portion of the splanchnic nerves and the lower four dorsal sympathetic ganglia, on both sides, does not prevent, cure or permanently lower in any degree experimental renal hypertension produced by renal ischemia."

To test the probable application of their results to human medicine, the Cleveland investigators[4] then attempted to produce a similar chronic hypertension in monkeys. Large, mature, young giant-type macaques were used. Blood pressure before and after the production of renal ischemia was determined by the Riva-Rocci method, the cuff being placed about the abdomen with auscultation of the femoral artery. An occasional control reading was made by inserting a hypodermic needle in the femoral artery and recording the "mean pressure" on a mercury manometer. In their most successful experiments both the systolic and diastolic blood pressure rose from the time of partial closing the second renal clamp. Maximum hypertension was reached by the end of about eight months, and has persisted till the time of their report (fifteen months). At the present time one monkey has a systolic pressure of over 300 millimeters of mercury, its preoperative pressure being in the neighborhood of 130 millimeters of mercury. The diastolic pressure in this animal had increased from the preoperative level of 90 millimeters of mercury to the present level of about 220 millimeters of mercury. The possible therapeutic effect of bilateral sympathectomy has not yet been tested in monkeys.

CARDIAC SYNCOPE AND SUDDEN DEATH

Acute cardiac syncope remains one of the most difficult emergencies with which the physician has to deal. The difficulty lies in the fact that the situation appears so suddenly, and that it may be either acute block or ventricular fibrillation. It is not easy to tell promptly which condition is present. Since effective treatment depends on the diagnosis, great

† This department of California and Western Medicine presents editorial comments by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. skill is demanded in order to make a rapid decision and to act efficiently and wisely. California workers have made notable contributions in regard to the successful handling of either acute heart-block or ventricular fibrillation. Nathanson [1] of Los Angeles has made an especially clear analysis of the problem, and his work deserves full appreciation.

First carefully investigated by the English chloroform commissions, acute cardiac stoppage in anesthesia was shown in the classic studies of Goodman Levy [2] to be due chiefly to hyperactivity of the sympathetic system, with perhaps sudden adrenin release. In this situation ventricular fibrillation may occur. The clinical significance of this matter in anesthesia has been admirably discussed by Knoefel [3] and Guedel.[4] Knoefel makes the pertinent suggestion of using the barbitals in preanesthetic medication in order to prevent this type of syncope from developing. In an investigation particularly thorough, Nathanson has demonstrated that quinidin or acetyl-beta-methylcholin will prevent prefibrillation rhythm. Escamilla [5] has reported clinically on the use of quinidin in preventing transient ventricular fibrillation. The California group, therefore, emphasizes the importance of taking measures preoperatively to prevent ventricular rhythm from making its embarrassing appearance. This emphasis is certainly warranted, since effective treatment is difficult because of the acuteness of the situation once it develops. Certainly the etiology of ventricular fibrillation makes it clear that intracardiac injections of epinephrin are definitely contraindicated. Sensational newspaper reports of "bringing the patient back from the grave by injecting adrenalin into the heart" should decidedly not encourage surgeons to make intracardiac injections of epinephrin as soon as it may seem that the heart has stopped during an operation.

On the other hand, acute cardiac syncope may be complete heart-block resulting from excessive parasympathetic activity, either reflexly, as from pressure on the carotid sinus, or by central excitement and apprehension. In this situation atropin is well established as a method of paralyzing the vagal endings and preventing the acute block. The preoperative administration of atropin is definitely indicated for this purpose, especially in an apprehensive intellectual patient, who may give the impression of complete control of himself. This use of atropin is indicated in addition to its administration for preventing excessive flow of mucus. If acute heart-block does appear, Nathanson [4] has clearly shown that injection of epinephrin or its derivatives is the most effective means of getting the ventricles to beat again. These agents directly stimulate the cardiac accelerator mechanisms. It should be carefully remembered, however, that the very reasons for effectiveness of epinephrin in heart-block are the same for which it is contraindicated in ventricular fibrillation. If the heart stops in the early stages of anesthesia from vagal block, then intracardiac injections of epinephrin are justified, but if it goes into syncope from ventricular fibrillation, then epinephrin is contraindicated. How is the surgeon or anesthetist to tell promptly what the situation is? It is not easy, and for this reason it is wise to take proper preoperative measures to prevent either.

THE UNPADDED PLASTER OF PARIS CAST

The use of plaster of paris or gypsum for splintage dates to the Arabian physicians [1] of the tenth century. Needed facility in handling of this plaster started a century ago when Mathijssen,[1] a Dutch army surgeon, promulgated the idea of impregnating cloth with dry plaster. In recent years the introduction of the fast-setting plaster has proved a tremendous advance. Originally, the gypsum casts were in massive blocks, but they have been evolved to the thinnest and lightest of all forms in the unpadded plaster type. The Austrian surgeon, Bohler, through his teachings has perhaps done most to promote this latter idea of splintage.

Those who are averse to plaster casts are apt to be doubly averse to the nonpadded type. A fracture axiom is this: "It is the doctor behind the splint, and not the splint that counts." [2] But given the use of proper details in the application of the unpadded splint, its wide field of application and its mechanical correctness should encourage enthusiastic adoption.

Air cushions are comfortable because pressure is distributed equally over wide surface, which makes pressure per unit area very small. A pillow of feathers is soft to the head for the same reason. If it were possible to make out of stone a perfectly fitting cast to the head, this "stone pillow, theoretically, should be quite as soft as feathers. A version of Pascal's simple physical law of the transmission of pressure is expressed in the statement that total force is equal to the product of pressure or weight and area. ($F = P \times A$). The principle finds a common illustration in the hydraulic press. With a given force, pressure will increase as the area decreases, and conversely pressure will decrease as the area increases. A well-fitted, unpadded plaster cast creates a maximum area with a resultant minimum pressure. Ill-fitting casts, padded casts, and the mechanical devices which offer support in re-

1 Bacon, L. W.: On the History of the Introduction of Plaster of Paris Bandages as a Fixation Dressing, Bulletin of the Society of Medical History of Chicago, 3:122-132 (Oct.), 1923.

2 Moorhead, John J.: Quotation from A. C. S. Coöperative Committee on Fracture, Traumatology, 1:2, 3 (April), 1933.

stricted surfaces, provide a limited area, creating thereby greatly increased pressure.

Early reduction of a fracture with application of an unpadded plaster cast completely surrounding the part will in many cases prevent swelling that would otherwise occur. Swelling that may occur following application of the cast usually is controllable by elevation of the part. At the outset the cases require watching to prevent and intervene if necessary, should signs of potential serious ischemia appear. A nonpadded plaster cast maintains fixation which cannot be promised in the padded type. In this latter splint it is practically impossible for padding to be uniform, and encircling bandages over the padding usually accentuate the lack of uniformity. An unpadded plaster of paris collar in the case of a cervical spine fracture, fitted carefully and extending down beneath the arms and over the upper chest, offers a "maximum area with a resultant minimal pressure." This type of splint is far more comfortable than the leather collars and other apparatus whose sole support focuses on a few square inches and thereby magnifies the local pressure. Padded casts for other parts of the spine or the extremities soon become loose, and the ill-fitting points of contact support the total pressure which becomes greatly amplified, but which would be minimal were surface available to dispose pressure widely and evenly. Poking cotton and packing beneath casts about pressure spots rarely is of value; on the contrary, very soon it creates a new pressure point or irritates an old one when the padding rolls into a wad and becomes displaced. The packing interrupts wide surface contact and multiplies pressure through diminishing contact area.

Success with the unpadded plaster cast depends on close attention to details in its application. When practicable, swelling should be dispersed before these casts are applied. When not practicable, old casts should be replaced by new ones when swelling has subsided. In applying the plaster, bandages should not be drawn tightly but lightly. Creases should be avoided. The plaster should be modeled; in doing this, pressure is not made with the finger tips but with the whole surface of the hand and with a force that disposes the plaster evenly. Fast-setting plaster is particularly desirable for successful modeling. Cut patterns of plaster for any part will often greatly aid in the ease and perfection of application. The patterns may be reenforced or united in their segments by the circular bandage of plaster. Modeling the plaster over potential pressure areas, such as the malleoli, the heel, the neck, the spine and joints generally, will meet with more success if small squares or units of plaster are used. Two by two inches represents a suitable size for many purposes. The smaller the part to be modeled, the smaller the square or strip of plaster should be that is used, if smoothness and evenness of application are to be achieved. Even such small parts as fingers may be splinted with unpadded plaster either for splintage itself or for purposes of traction. A case in point is a badly compounded fracture of the metacarpals with the whole hand considerably infected. Hazard of infection precludes skeletal transfixion through the phalanges. Small strips of plaster, one-half inch in width, would make in this case perfect nonpadded casts to the fingers that would be comfortable. Hooks for traction can be incorporated in the plaster. After drying, the plaster may be shellacked, the part set up in a banjo-splint, and wet dressings and irrigating solutions would prove to be practicable.

In summary it may be said that the unpadded plaster casts are comfortable because the wide surface of contact brings unit pressure to a minimum. Their use early in fractures following reduction minimizes swelling. These splints insure unchanging fixation and allow a patient quickly to become ambulatory. The combination of their beneficial qualities hastens bony repair and rehabilitation. They are not difficult to apply; they may be made light in weight and thin, and are economical. Success in their use, however, demands close attention to details in their application. Wide field of application, finish and, above all, mechanical correctness, will insure, it would seem, increasing adoption of the unpadded plaster of paris cast.

LOCAL INJECTION ANESTHESIA: SOME ERRORS IN CONNECTION WITH ITS USE

A recent sequel to the injection of novocain and adrenalin leads to the presentation of the following unfortunate developments in connection with the use of novocain anesthesia locally.

In the above incident a man of seventy, definitely arteriosclerotic but without any evident peripheral vascular insufficiency, had the base of his right index finger injected with about 10 cubic centimeters of one per cent novocain, containing several drops of 1:1000 adrenalin. A tourniquet was not used. Incision was made for the cure of a paronychia. Three hours later the finger was cold and cyanotic, and the condition went on to a definite gangrene.

A woman of forty-five came to the out-patient department of a large county hospital, for the removal of a lipoma from the popliteal region. The tumor had been present for many years. The soft growth was the size of a fist, rather fixed, and seemed to infiltrate the underlying tissue. The overlying skin was prepared with iodin and alcohol, and a sterile towel placed near the field. Sterile gloves, but only a "clean" gown was used by the operator. A considerable quantity of one per cent novocain without adrenalin was infiltrated in and about the tumor, and an incision was made over the growth. Some difficulty was encountered in its removal, as it seemed to extend toward the knee joint in a branching fashion. A great deal of bleeding was present, and the assistance necessary for the proper exposure of the wound was not available. Finally, the tumor was removed; a Penrose drain inserted, and the wound sutured. On the patient's return two days later, the wound was

found infected. She was hospitalized, and most of the sutures removed. A definite cellulitis, however, had set in, and multiple incisions of the leg were found necessary. The infection did not clear up, but invaded the knee joint. After several months of drainage and disability, the leg had to be amputated above the knee.

A man of twenty-two had some vague complaints referable to the abdomen and an irregular, low-grade fever. The diagnosis was obscure. A palpable node was found in the left axilla, and it was decided to remove it for biopsy. The skin was prepared with iodin and alcohol, and the tissues infiltrated with one per cent novocain. A two-centimeter incision was made over the node. However, the gland proved to be elusive and was not easily found. An excessive amount of fat called for considerable dissection and more novocain. Finally, a bit of tissue believed to be the node was removed, and the wound closed without drainage. Two days later there was redness and tenderness at the site of the incision. A cellulitis developed and repeated incisions were made. Drainage continued for many months, and the end-result was a weak, atrophic left arm with a stiff shoulder.

From the above incidents it would appear that a more critical selection of cases for local novocain anesthesia should be made, and that:

1. In the aged, on extremities, adrenalin should not be used with novocain.

2. Minor surgery under local anesthesia should be treated with the same aseptic respect as major surgery, provision being made for adequate draping, assistance, and control of bleeding.

3. Either general or regional block, rather than infiltration anesthesia, is preferable where excess fatty tissue is present, or extensive dissection is done.

ON THE FATE OF EPINEPHRIN IN THE BODY

Pharmacologists have long known that the effects of epinephrin, injected into the animal body, are quite transient—a fact which limits its therapeutic use.[1] Just what happens to epinephrin in the animal body is not known. The hormone is readily autoxidisable *in vitro* under the conditions of pH and temperature which obtain in the body, and it has often been assumed that the same mechanism is responsible for the inactivation occurring in the body. The recent investigations of Blaschko and coworkers[2] indicate that the *in vivo* inactivation of epinephrin is indeed due to oxidation, but that such oxidation differs in important respects from the course of events *in vitro*.

As a background for consideration of the inactivation of epinephrin in the body, the facts known concerning *in vitro* oxidation will be briefly outlined. The first oxidation product appears to be an orthoquinone. On further oxidation an indole derivative is produced, which is probably responsible for the pink color appearing in epinephrin solutions on standing. Complex oxidation and polymerization follow, some eight or nine atoms of oxygen being absorbed for each molecule of epinephrin present. Sympatheticomimetic activity is probably lost with the first step in oxidation.[3]

It is unlikely that autoxidation is the sole cause of inactivation of epinephrin in the body, since various substances present in blood and other body fluids and in tissue extracts serve to delay this reaction markedly. It is now known that amino-acids, guanidine, ascorbic acid (vitamin C), cystein, glutathione, and possibly other substances serve to inhibit the autoxidation of epinephrin. The rate of disappearance of epinephrin differs in different tissues—a fact which necessitates qualification of Elliott's statement that "adrenalin disappears in the tissues which it excites."[4] For example, no disappearance of the hormone occurred on perfusing blood containing epinephrin through the hind legs or lungs. The chief site of inactivation appears to be in the liver, kidney, and small intestine. Blaschko and coworkers[2] have shown that an enzyme system is present in these tissues which brings about rapid oxidation of epinephrin. This enzyme they have named "adrenalin oxidase." In accordance with earlier work, this enzyme was shown to be absent or present in very low concentration in skeletal muscle or spleen. There is no known reason why this enzyme system should not be operative *in vivo*. It is certainly suggestive that the organs in which it has been found are those which the earlier workers discovered were chiefly responsible for the disappearance of the hormone from the circulating blood.

The oxidation of epinephrin *in vivo* differs from that *in vitro*, not only because of the presence of this enzyme system in certain tissues, and because of the widespread occurrence of inhibitors of autoxidation, particularly sulphydryl compounds, but also in the fact that the total oxygen uptake *in vitro* is seven to eight molecules of oxygen per molecule of epinephrin, whereas the total oxygen uptake *in vivo* is but four atoms per molecule. This implies a quite different chemical picture.

Summarizing: The transient effects of epinephrin in the animal body are probably attributable to oxidation of the hormone through the action of "adrenalin oxidase." This event occurs chiefly in the liver, kidney, and small intestine.

Success, in so far as it may be gained through training, is won by cultivating such powers and attitudes of mind as interests; the habit of observing and reading; expressing one's self through conversation and discussion, through speaking and writing; intellectual curiosity and study; freedom from superstition and prejudice; open-mindedness; and the ability to profit by experience.

ORIGINAL ARTICLES

MICRO-SURGERY IN CHRONIC SIMPLE GLAUCOMA*

By Otto Barkan, M.D.
San Francisco

Discussion *by Robert Steele Irvine, M. D., San Francisco; Joseph Crawford, M. D., San Francisco; John C. Williams, M. D., San Francisco.*

THE writer has recently reported an operative procedure [1,2] for the relief of chronic simple glaucoma, which consists of opening Schlemm's canal under direct magnified vision. This procedure removes the block to the circulation of intra-ocular fluid which can be shown to be the mechanical cause of the increased intra-ocular pressure. It restores the physiological direction of outflow to the intra-ocular fluid instead of creating an abnormal outlet with its frequent complications and sequelae that may follow present-day operations. By means of a contact glass which has been devised for this special surgical purpose, the operator can see the area of blockage, and can watch and guide his instrument during the operation. The operative procedure when thus performed is without danger, and its objective, namely, opening of Schlemm's canal, can be deliberately performed with the trabeculum under full view. In those cases in which the trabeculum was incised over a sufficient extent, the intra-ocular pressure has returned to normal. According to observations during the last one and a half years, the results show promise of being permanent.

In this article an improvement of technique is suggested which will more certainly insure the opening of the canal. The original technique of operating under 4 x magnification affords a convenient range of some 20 centimeters and a fairly wide field. Because of the moderate degree of magnification, however, one cannot be quite certain of always striking the canal and of opening it over a sufficient extent in all cases. In those cases in which the canal was insufficiently opened, the intra-ocular pressure has been only partially reduced, and a later operation has been necessary to secure normal pressure. The technical variation suggested in this article consists of increasing the magnification from 4 x to 20 x. This increase of magnification is obtained by using the binocular corneal microscope attached to the surgeon's head by means of a helmet (Fig. 1). Although not easy of performance, the assurance of opening Schlemm's canal afforded by this higher degree of magnification would seem to be an improvement over the original technique in those cases where it is indicated.

MICRO-SURGICAL TECHNIQUE OF OPENING SCHLEMM'S CANAL UNDER DIRECT VISION

The surgeon wears a helmet to which is attached a binocular corneal microscope. He helps to steady

Fig. 1.—Photograph showing use of the binocular corneal microscope in author's operation of opening Schlemm's canal under direct vision.

the microscope with his left hand which, in turn, by means of a finger, keeps in contact with the patient's head. A trained assistant standing behind the patient's head for the left eye, and at his right side below the head for the right eye, fixates the bulbus at the temporal limbus with a small Elschnig forceps held in his right hand. With his left hand he steadies the surgical contact glass by means of a double-pronged probe which fits into two depressions on the convex surface of the glass. A second assistant guides the narrow beam of the hand lamp from across the bridge of the patient's nose to transilluminate the nasal portion of the limbus and the corresponding region of the angle of the anterior chamber. The surgeon supports and focuses the microscope with his left hand, while he guides the knife with his right hand. He sits on a stool adjusted to such a height that, by means of a slight movement of his head, his gaze may be directed first at the limbus and then transferred above the temporal edge of the contact glass to the anterior chamber, from which point he continues to guide the knife across the chamber by direct vision through the glass. When the blade reaches the highly magnified angle, its point is inserted exactly into that portion of the trabeculum which covers Schlemm's canal and the incision is continued for several millimeters along this line. That this may be accomplished with a high degree of certainty and exactitude is proved by postoperative biomicroscopic examination of the angle, which shows a single straight dehiscent slit of the trabeculum opening Schlemm's canal. What appears to be the glistening white inner lining of the opposite side of Schlemm's canal is clearly visible through this longitudinal bisection of its wall (the sclerocorneal trabeculum may be found to be bisected or sometimes torn off, constituting what may be called either a trabeculotomy or trabeculectomy, as the case may be). The working range is 6 centimeters

* Read before the Eye, Ear, Nose and Throat Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

from the patient's eye to the tip of the objective, or 20 centimeters from the patient's eye to the eye of the surgeon. The image is kept in focus by the surgeon shifting his head, and for finer adjustment by using the sliding scale of the microscope, for which the fingers of the left steadying hand are used.

MICRO-GONIOSCOPE

The binocular corneal microscope has in the past been used by some ophthalmologists for the removal of foreign bodies from the cornea. This procedure I have found satisfactory in routine practice for many years, the patient sitting upright with his head on the chin rest. Recently, Schoenberg [3] has suggested its use for intra-ocular surgery, and reports attaching the head of the corneal microscope to a stand on a table, at the side of which the patient is lying, in order that it may be used in the course of surgical operations. He suggests that various uses are possible, but does not, as far as I can gather from reading his article, report having actually applied it to intra-ocular surgery nor proved its practicability for this purpose. Before reading his article such a use had occurred to me for my "micro-gonioscope," [2] which consists of a binocular microscope mounted on a highly flexible stand; however, the semi-rigidity of even this very flexible apparatus renders it unsatisfactory for purposes of intra-ocular surgery. It was for this reason that I divorced the microscope head from its stand and attached it to the surgeon's head where, with the additional steadying influence of the surgeon's hand, which maintains contact with the patient's head, it works out satisfactorily. Contact with the patient's head is found to be necessary if one considers that the slightest movement between microscope and object is magnified 20 x, and if one further takes into account the narrow breadth of focus and the limited field of vision when using this high degree of magnification. The field of vision, when using the 2 x objective and 10 x ocular combination is only 6.9 millimeters in diameter.

CONCLUSION

Examination of the living eye with the binocular corneal microscope is customarily called "biomicroscopy"; examination of wet specimens of the eye with the same instrument has been termed "micro-anatomy." [4] To operate within the living eye with this technique may be aptly termed intra-ocular "micro-surgery." As far as I am able to judge from a review of the literature, this is the first time that such high magnification has been applied in intra-ocular surgery.

The use of the binocular microscope, although it demands deliberate care and trained assistance, is feasible, and the procedure of choice when operating on Schlemm's canal under direct magnified vision in those occasional cases where extra assurance of striking the canal is required.

DISCUSSION

Robert Steele Irvine, M. D. (490 Post Street, San Francisco).—That the results of the present treatment of chronic glaucoma are far from satisfactory can scarcely be disputed by anyone who will take the trouble to review his own records, or those of any clinic, where a fairly large amount of material is available. We frequently see these patients with a gradual loss of vision, despite our efforts, until the familiar and tragic white cane appears on the scene.

This paper of Doctor Barkan's is the summation of what he has written and done within the past three or four years, and presupposes some knowledge of the foregoing. It is an application, in a greatly improved manner, of the surgery of De Vincentiis, controlled by visualization through a contact glass such as heretofore had been limited to diagnostic purposes only in the attempts by Trantas, Koeppe, Frick, and Troncoso. He has set up definite conditions for its application, which enable him and us to determine its possibilities.

I have had the privilege of examining with Dr. Otto Barkan several of these patients, both before and after this microsurgery, and with his equipment the demonstration is not difficult and is indeed striking. I have also seen the operation performed, have seen the records of patients, over a period of two years, and have been impressed by the freedom from operative trauma, and the consistency of the results, as to the reduction of tension. The pigmented trabecular line can readily be recognized and incised under direct, magnified vision. There is no loss of aqueous, with the resultant plasmoid fluid, to further unbalance the mechanism.

Most of us are accustomed to working under high magnification, such as removing foreign bodies with a corneal microscope or slit-lamp, but unless this dexterity is present it does require unusual coöperation by the assistants and some skill, to avoid damage to the iris or scleral spur, or perforate the cornea. This is the reason for visual control throughout the incision. The difference between the arc produced by the knife, and that of the limbus must be considered.

This paper stresses the latest development in higher magnification, which, up to the point of too much narrowing of field or distortion, insures greater accuracy in placing and controlling the incision; a new field of surgery for which we should be appreciative.

❦

Joseph Crawford, M.D. (Medico-Dental Building, San Francisco). — Before discussing this modification of the author's operation for the relief of chronic simple glaucoma, by using a binocular corneal microscope attached to the surgeon's head, instead of an ordinary loupe, a brief description of the operation itself may be in order. If we accept the author's premise that the most frequent cause of chronic simple glaucoma is obstruction of the flow of aqueous from the anterior chamber into Schlemm's canal with a consequent rise of the intra-ocular pressure, any operation reëstablishing this function of that canal is indicated. Most of the operations used today for the relief of chronic simple glaucoma are external, filtering operations, in that they provide egress for the aqueous that is drained off imperfectly. De Vincentiis, in 1892, first suggested an internal incision in the iridic angle to reëstablish the normal route through Schlemm's canal; but due perhaps to the danger of the operation—for it was a blind one—it was not accepted generally. The danger is that of injury to the ciliary body, with resultant hemorrhage. Similarly other operations which are now also almost obsolete, such as anterior sclerotomy and internal sclerotomy of de Wecker, when they were effective in this type of case would appear

to have been so by virtue of their having struck the trabeculum on their way into the chamber. Otto Barkan first suggested the idea of incising Schlemm's canal from the inside while it is under direct binocular observation. He devised a contact glass which, when used with a loupe and a good source of focal illumination, makes it possible to incise the sclerocorneal trabeculum over Schlemm's canal while it is under full view. This type of internal filtering operation has much to recommend it, because it restores the physiological direction of outflow for the aqueous.

The magnification with a loupe is four times. Greater magnification is desirable. The binocular microscope increases the magnification to twenty times, but at the expense of working distance, breadth of field, and steadiness of image. Anyone who has tried removing a corneal foreign body under a slit-lamp can appreciate the difficulties of operating with these limitations. To perform such a delicate operation, as incising the sclerocorneal trabeculum with the microscope fastened to the surgeon's head, would make the operation too difficult for any but the most skilled operator.

While I have not as yet performed the operation, due to lack of a suitable contact glass, through the courtesy of Doctor Barkan I have had the opportunity of seeing a number of patients on whom he has operated. The results were so much better than one could expect from operations for the relief of chronic simple glaucoma that one cannot avoid being enthusiastic about its possibilities. Patients who had a persistently high tension with typical glaucoma fields before operation, had normal tensions for as long as a year after operation. The need for continued use of miotics had ceased. Amazingly enough, in one or two cases, there was an increase in the visual field. Most astounding of all was the fact that there was no visible evidence of an operation except by examination with the microgonioscope. The usual signs of a filtering operation, such as distorted iris, conjunctival scarring, bleb formation, etc., were lacking. Instead, an examination with the slit-lamp and contact glass revealed in the iris angle a long, gaping slit in the trabeculum, so well described by the author in previous articles. No one could see these postoperative results without the conviction that, at least in many cases of chronic simple glaucoma, surgical relief is possible and the operative problem is solved.

It appears to me that, for routine work, the operation is such an excellent and practical one that every eye surgeon will eventually use it in many, if not most of the cases of chronic simple glaucoma. By using the technique originally described by the author, the operation is feasible for anyone doing ophthalmic surgery.

John C. Williams, M.D. (490 Post Street, San Francisco).—The new method of approach of Dr. Otto Barkan to the study and alleviation of glaucoma has already given remarkable results and holds greater promise. As progress is made in the study of the micro-anatomy of the angle, refinements of technique will follow, and it is on this account that we view with such interest the application of high magnification not only to the study of the angle but, as we learn in this paper, also to the actual surgical procedure. On expressing my interest in his research, Doctor Barkan offered me the opportunity to study his methods and follow the results obtained. In two cases, I have followed the clinical course for a long period before the trabeculotomy, as well as afterward. Full control of the increased intra-ocular tension was never obtained under medical care, with the consequences that central and peripheral vision were gradually decreasing. After opening Schlemm's canal about one-fourth of its circuit, tension has been within normal limits without further use of miotics, and both central and the peripheral vision are improving. It is particularly fortunate in one of these cases that pilocarpin is no longer necessary, since the lids had become sensitized to its use. It may be said, in parenthesis, that miotics are used as a temporary measure after incision of the trabeculum to pull the root of the iris away from the angle until healing has taken place. This period of time is brief, for the after-reaction to this surgical procedure is remarkably slight. It would be feasible to repeat the operation if future time should show its necessity; but patients followed over a period of several months continue to maintain their improvement. In certain cases in which the glaucomatous process has not been fully controlled, it has been found that Schlemm's canal has not been adequately opened for a sufficient extent. Results of properly selected cases convince me that Dr. Otto Barkan's procedure in opening Schlemm's canal has proved a notable advance over existing methods in controlling chronic glaucoma. If the use of high magnification fulfills its promise of allowing this work to be done more accurately, it will be held a valuable addition to eye surgery.

Doctor Barkan (Closing).—I wish to thank the discussers for their contribution to the subject, and their words of appreciation. I have not yet seen any of these openings of Schlemm's canal close up. It is my impression that there is no tendency to heal over. However, the number of cases (twenty-five) operated on to date is too small, and the time elapsed too short to permit of any definite statement in this regard. In those instances where the incision has been insufficient and the result incomplete, it is possible to operate again. Operation is indicated in those cases which I have classified as Type I, and which are characterized by an open angle and a blocked trabeculum. There are also other cases, such as certain types of secondary glaucoma and hydrophthalmus, where the method is applicable. I am glad that the safety of the operation has been brought up, and that, in view of its being so safe, which cannot be said of any other glaucoma operation, one of its main applications may prove to be as an early operation. The operation can be performed by any well-trained and properly equipped ophthalmic surgeon. I expect that the latest model of the surgical contact glass, which was completed a few weeks ago, will prove to be the final one and should be available by you all within the next two months. I should like to take this occasion to suggest that anyone intending to do the operation should familiarize himself with the diagnostic set-up and with biomicroscopy of the angle of the anterior chamber before embarking upon the surgery of it.

PHYSICAL PHENOMENA ASSOCIATED WITH ANXIETY STATES: THE HYPERVENTILATION SYNDROME*

By William J. Kerr, M.D.
Paul A. Gliebe, M.D.
and
James W. Dalton, M.D.
San Francisco

Discussion *by Edwin L. Bruck, M. D., San Francisco; Mayo H. Soley, M. D., San Francisco; Samuel D. Ingham, M. D., Los Angeles.*

In the past several years, increasing emphasis has been placed upon the importance of the interaction of the physical body and the emotions. It is now realized that emotions may precipitate the symptoms of physical disease; and it is assumed that variations in the severity of a disease in a group of patients with the same illness can often be explained by variations in intensity of their emotional disturbances.

The most obvious instances of the interrelationship between emotions and disease have been found in the study of patients who have had secondary psychic manifestations which have necessitated consultation with a psychiatrist. However, there are less well-defined psychological disorders which underlie manifestations of disease; and these are

*From the Department of Medicine, University of California Medical School, San Francisco.

Read before the General Medical Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2-6, 1937.

less easily recognized. The internist is often called upon to make a diagnosis in cases where the patient's true illness is masked or simulated by symptoms which are the direct result of the emotional state of the patient. In some instances the symptoms imitate so closely those of a common illness that the disease is diagnosed erroneously, and a discouraging prognosis is given. This results in an obvious reaction on the patient. Already the subject of anxiety and burdened with emotions, he becomes overburdened by the added anxiety concerning his state of health.

A FUNDAMENTAL CONCEPT

To understand the reactions described above, it is necessary to accept a fundamental concept. The principle of psychobiology states that body and mind are indivisible, and that the body or physical structure without the mind is inanimate and has no human meaning. Whatever affects either the body or the mind at any time affects the individual as a whole.

Such a principle seems almost too obvious to be worth mentioning. However, it is stated at this time because too many physicians and surgeons, although recognizing its truth, continue to treat only the patient's body. When a patient's symptoms do not respond readily to treatment of organic disease, and evidence of anxiety is uppermost, the patient is classified as neurotic and is forthwith referred to another physician. However, more and more internists and surgeons are coming to recognize the importance of the relationship between mind and body; and, as a result, psychiatry is gradually losing its identity as a medical specialty and is, instead, becoming a new tool in the hands of internist and surgeon.

PSYCHOBIOLOGIC APPROACH

The psychobiologic approach, with its concept of the unity of the human organism, has served to widen the scope of psychiatric investigation. The immediate result of this more extensive investigation has been a deeper appreciation of the emotions of the individual. Comprehension of the importance of the emotions has been difficult because many physicians and surgeons have considered the indefinite symptoms, often complained of by patients, to be purely imaginary and without physiological basis. As a matter of fact, these indefinite symptoms have the same underlying mechanism as more physical manifestations, such as diarrhea and urinary frequency, which are not in any sense of the word "imaginary," and yet which may be caused entirely by disturbances of the emotions.

AUTHORS' STUDIES

During the past three years, several of us have been attracted to one phase of this problem because an increasing number of patients have appeared who were suffering from symptoms of tetany which could be explained only on the basis of hyperventilation. Also, patients have been seen in consultation who had definite symptoms and signs of organic disease, but who were suffering, in addition, from symptoms similar to those of patients who had been found to have hyperventilation tetany. Hyperventilation exercises and metabolic tests gave similar results for the patients in both groups, and all of them responded to the same type of therapy.

HYPERVENTILATION TEST

For the study of these patients, the hyperventilation exercise has been devised as a diagnostic procedure. In this test the patient is asked to lie on a bed without constriction from clothing, and to breathe at a rate of eighteen to twenty breaths per minute. Thus, hyperventilation is induced, which reduplicates or aggravates the patient's symptoms.

OTHER TESTS

In addition, the following tests were made on the patients of our series in order to rule out other causes of tetany, and to determine, if possible, whether or not a state of alkalosis existed: The reflexes were tested before, during and after the hyperventilation experiment. Before and after the exercise, determinations of the carbon dioxid combining power, chlorids, proteins (serum albumin and globulin), magnesium, calcium (diffusible and nondiffusible fractions) and phosphorus of the blood were made. The p^H and content of ammonium salts of the urine were estimated. In most instances, the basal metabolic rate was determined.

For all the patients in our series, similar results were obtained from these tests. The usual causes of tetany were eliminated. An alteration in the carbon dioxid combining power of the blood and a decrease of ammonium salts in the urine were found, which suggested that alkalosis was present. Since rather cumbersome methods were used at the time the studies were first made, it is possible that more marked changes had occurred followed by a partial return to normal before the samples were obtained. That such was the case is suggested by the results of later studies made by Doctors Shock and Soley,[1] who used a micromethod which is mechanically more adaptable. Their findings seem to indicate that the whole reaction is caused by tissue alkalosis, with the subsequent production of tetany or allied symptoms.

HYPERVENTILATION SYNDROME

Briefly, the train of events leading to the production of anxiety and the subsequent development of the hyperventilation syndrome can be described as follows: An individual has a difficulty to meet. The reaction, psychologically, may be one of two types: the individual may face his problem squarely and find a solution; or he may attempt to ignore the difficulty and to deny its existence. Regardless of any attempt on the part of the patient to deny the existence of his difficulty, nevertheless it still exists. In our opinion, it is the suppressed emotion associated with the difficulty that directly stimulates the autonomic nervous system. The sympathetic nervous mechanism is aroused, and the most outstanding reaction is a stimulation of secretion by the adrenals. The cerebral cortical centers are stimulated directly, and also by oversecretion of adrenalin. Adrenalin irritates also the cardiac and respiratory centers, causing at first a slow heart

rate with a large stroke-volume output, and later a rapid heart rate. There is speeding up of the respiratory rate and increase in ventilation. With the increase in ventilation the carbon dioxid in the alveolar spaces is expelled, and more is shifted from the blood stream and tissues into the alveolar spaces. Chlorids are retained in the blood, and phosphates likewise. Urea is not produced by the liver, hence ammonium salts are decreased in the urine. These later manifestations are the result of an attempt on the part of the body to prevent too great a shift to the alkaline side because of the sudden loss of carbon dioxid. However, the buffers that are mobilized do not entirely compensate for the loss of carbon dioxid, and as a result the patient suffers from the lack of sufficient acid ions and experiences irritability of muscle tissue because of alkalosis.

RÔLE OF ALKALOSIS

Some investigators[2] believe that the alkalosis does not explain the whole picture in this syndrome. They assume that the symptoms are caused by asphyxia, a lack of sufficient oxygen in the tissues. It has been stated that the attacks may be relieved by inhalation of oxygen without any carbon dioxid in the inspired gas. To a certain extent these conclusions may be true. Years ago[3] physiologists described the effect on the peripheral vascular bed of alkalies, oxygen, carbon dioxid, and acids; and of stimulation through the controlling centers in the central nervous system. It was found that acids and carbon dioxid, when applied locally, dilated the capillaries; when applied centrally, these vessels were constricted. In the study of patients suffering from the hyperventilation syndrome, both of these changes[4] in the peripheral vascular bed of the hands and feet have been found. Alternately, areas of cyanosis and redness caused by dilation of venules and arterioles, and areas of blanching due to arteriolar constriction, have been observed. These alterations in the condition of the vascular bed are sufficient to cause sensations in the skin through irritation of nerve-endings. Paresthesias have been described in nearly every instance.

SYMPTOMS OF HYPERVENTILATION SYNDROME

When the hyperventilation syndrome is present, a typical description of symptoms may be secured from the patient without much prompting. Some patients state that after a minor nervous reaction, epigastric discomfort is experienced, or palpitation followed by rapid heart rate. Sometimes there is a sense of constriction around the throat; and breathing deeply not only may fail to give relief, but may aggravate this symptom even to the point where the patient feels that he is suffocating. The patient, himself, or one of his relatives, may have noted that he is in the habit of sighing frequently, particularly when he is restless. Frequently the patient will be seen to gasp while describing his symptoms to the physician. Other symptoms that are often mentioned are stiffness of the hands and feet, dizziness, slight nausea, weakness and easy fatiguability. The sensations complained of are frequently described as severe or painful.

In many patients the hyperventilation exercise will reproduce all of the symptoms which have occurred during attacks. When carbon dioxid is inhaled from a small tank through a mask, with the patient continuing to breathe as during the exercise, these symptoms rapidly disappear.

Sometimes it is difficult for the patient to understand why small irritations now disturb him so much, whereas formerly considerable irritation was necessary to produce the marked sensations. The effect of adrenalin is that of increasing summation of nerve impulses; it has no effect on the chronaxie of the nerve. Because this is true, small or insignificant stimuli will in time cause protean manifestations. This is the reason why these symptoms can be induced in normal individuals by prolonged volitional breathing, although under ordinary conditions they do not have these sensations.

DIAGNOSIS

There are a number of common diseases, the symptoms of which are simulated by the hyperventilation syndrome. In an intensive study of thirty-five patients,* and observation of a larger group, a number of patients were found who had symptoms of precordial pain and rapid heart rate. Some of these patients were referred by physicians who had made the tentative diagnosis of coronary occlusive arterial disease or of aneurysm of the aorta or angina pectoris. When it was found that they reacted positively to the hyperventilation exercise, these patients were treated accordingly, and relief was obtained.

Other patients were seen who had suffered from symptoms suggesting Raynaud's syndrome. In these, spasm of the carpal arterioles was initiated by hyperventilation, and was relieved by the use of acid salts and an acid-ash diet.

There were several patients who had suffered asthma. In some of these an eosinophilia was noted. After all types of allergic reaction had been ruled out by skin tests and trials, the procedures described above were instituted, and successful therapy given.

Symptoms of peptic ulcer were found more often than those of any other disease. The Sippy treatment had aggravated the condition of these patients, for a very obvious reason. With the patient already bordering on a state of alkalosis, the addition of alkaline powders was more than enough to precipitate symptoms.

Other conditions with which this syndrome was confused were thyrotoxicosis and Mèniére's disease. Many of the patients with the former condition returned with recurring symptoms of thyrotoxicosis, following removal of an adequate portion of the gland. On examination, no objective findings indicated a return of thyrotoxicosis. These patients, likewise, responded to therapy directed toward the hyperventilation syndrome. In the group with Mèniére's disease, it was noted that nystagmus could be induced easily by the hyperventilation exercise; however, some one of the

*A detailed report of this study will appear in *The Annals of Internal Medicine.*

classical symptoms was usually lacking, *e. g.,* tinnitus, or loss of hearing. Ventilation with carbon dioxid immediately restored these patients to a normal condition.

It should be kept in mind that the danger of any unified diagnosis for several groups of symptoms lies in the use of such a diagnosis as a wastebasket for all uninteresting and obscure diagnostic problems. The value of an understanding of the hyperventilation syndrome is dependent upon the degree of diagnostic acumen of the physician. Failures and regrettable mistakes will be made if true organic disease is diagnosed as the hyperventilation syndrome. A case in point is that of a patient on our hospital service. This woman complained of tetany-like contractures of the hands, which occurred when she was excited. She was found to have hyperpnea, and some distention of the stomach by gas or air. She died in a second attack of tetany. An electrocardiogram made before death because the heart sounds were impure, but examined after death, showed the correct diagnosis to be coronary arterial occlusion, whereas a clinical diagnosis of the hyperventilation syndrome had been made.

The syndrome was here as a superstructure.

TREATMENT

An understanding of the problem is of great aid in the management of patients with the hyperventilation syndrome. The hyperventilation exercise shows to the patient the part he, himself, plays in the initiation of his symptoms. The reduplication of symptoms is a dramatic demonstration. Following this demonstration, an explanation can be made to the patient in simple terms. The patient is told that similar symptoms in other patients have been relieved by adequate control of respiration. He comes to realize that, with some help, he can relieve his own distress. He also feels that the physician thoroughly understands his problem. When this confidence is established, it is easy for more intimate contact to be made in order to institute psychotherapy, the success of which depends on rapport.

The prescription of acid salts, such as ammonium chlorid to the amount of 6 to 12 grams a day in capsules or in mixture of licorice, has been found to be of definite benefit. This regimen shifts the acid-base balance so that acid ions predominate. For immediate effect a phenobarbital compound may be used, but usually is not necessary. An acid-ash diet is to be given in all cases, and reduction of the intake of water is likewise of value. Some investigators have stated that the regular administration of the quinin drugs, hydrastin and yohambin, desensitize the nerve tissues to the continued action of adrenalin—which may explain the successful use of quinin as a "nerve tonic."

SUMMARY

It is the belief of the authors that many patients suffer from a group of symptoms which are directly traceable to the action, over a long period of time, of the emotions on the physical body. These symptoms are sometimes observed in association with those of organic disease. It is believed that such symptoms are the direct result of repeated overstimulation of the autonomic nervous system, which indirectly induces a state of alkalosis; and the alkalosis, in turn, aggravates the reactions already present and produces additional symptoms. The mechanism of the reactions is discussed, and a diagnostic procedure (the hyperventilation exercise) is described. The patients in whom this syndrome has been observed had complained of tetany or convulsions, or of symptoms simulating those of angina pectoris, asthma, peptic ulcer, thyrotoxicosis, Raynaud's syndrome, and Mèniére's disease. When the hyperventilation is found to be present, adequate treatment consists of instituting proper ventilation, the use of acid salts, such as ammonium chlorid and of an acid-ash diet, and the removal of the underlying anxiety by psychotherapy.

DISCUSSION

Edwin L. Bruck, M.D. (384 Post Street, San Francisco).—For the last several years we have been interested in the symptoms presented by a small number of individuals, who have been usually characterized as neurotics. Many times these persons present themselves with the story that they are nervous, and that they have tingling and numbness of the four extremities, with occasional cramping of each of the feet or hands or both. Many times they may have also circumoral tingling.

When this train of symptoms is obtained in the history taking, they can be usually brought out in an exaggerated form or reproduced by the hyperventilation test as described by the authors. Most unusual symptoms may be produced in susceptible individuals with this test.

One may easily prove that such symptoms may be lessened or stopped through the rebreathing of carbon dioxid by the simple expedient of having the patient breathe and rebreathe into a large paper bag. Psychic origin of this chain of events cannot be denied in some cases, as they often appear in a hypertonic individual suffering from an anxiety neurosis.

However, the anxiety neurosis is not a necessary forerunner of this symptom-complex. Overbreathing from any cause will contribute to it, as in one patient of ours who could bring about the entire chain of events, even to the point of cramping in the hands, by a protracted spell of laughing.

There is, however, a chemical reason for production of these symptoms, often a self-induced alkalosis by the overindulgence in alkaline medications, usually brought to the attention of the laity through overzealous radio advertising. Likewise, the loss of chlorids, either through diuresis, sweating, vomiting or diarrhea, may produce a border state from which the individual is easily thrown into alkalosis, by minor overbreathing, giving rise to the usual symptom-

complex. It is also of interest to note that tissue hydration produced by intake of large amounts of water in susceptible individuals may produce some effects similar to those of alkalosis. Dederding and Fürstenberg have elaborated on this problem in their outlines of treatment of Menière's syndrome.

The authors have brought to our attention, forcibly, new criteria for the diagnosis of the alkalotic state, and have suggested efficient and simple modes of therapy which, in their hands and in ours, have produced beneficial results.

❀

Mayo H. Soley, M.D. (University of California Medical School, San Francisco).—Most physicians seeing consultation cases realize that two-thirds or so of their patients will have symptoms not directly related to any organic disease. Few of these physicians, however, have attempted to correlate the symptoms in their patients with the physiological effects of anxiety. Cannon, as long ago as 1915, demonstrated the effects of emotions on humans as well as on experimental animals. Since that time the spastic colon and hyperventilation syndrome have been added to the already recognized physiological effects of anxiety. The explanation that the symptoms of overbreathing are real, and can be reproduced, and that they are based on a fear mechanism, gives us a new and sound approach in the therapy of patients suffering from this condition. The intensity of the symptoms predominating in one system often makes the diagnosis difficult, but this predominance can be explained by the patient's fear of disease of that system with consequent exaggeration of sensations which he believes arise there. Usually, however, all of the characteristic symptoms from overbreathing can be obtained without asking leading questions, and point one to the correct diagnosis.

It should be stressed that treatment of patients suffering from anxiety states complicated by the hyperventilation syndrome with sedatives, acidifying drugs and diets, is merely a temporary measure to carry the patient along comfortably, while psychiatric investigation of the underlying fear is undertaken.

❀

Samuel D. Ingham, M.D. (727 West Seventh Street, Los Angeles).—Phychiatrists are encouraged to observe that internists are showing more and more interest and appreciation of psychiatric problems and their intimate bearing on the problems of internal medicine. It has long been realized, but not widely appreciated, that emotional states are invariably accompanied by characteristic variations in the functions of the vegetative nervous system, and the widespread physiological and biochemical reactions that result. It is still impossible, however, to reduce these reactions to simple formulas or to correlate them accurately in clinical analysis. We know, in a general way, that the acute emotional reactions run parallel to increased activity of the orthosympathetic, and inhibition of the activity of the parasympathetic systems. We know less, in fact very little, in a quantitative way, of the biochemical effects of the more prolonged or chronic emotional states, or moods, such as anxiety, grief, and the depressive states. This problem includes the evaluation of the physiological changes which may be observed in relation to the circulatory, respiratory, gastro-intestinal, genito-urinary, and endocrine systems; of the biochemical processes incident to each of the physiological changes and of their interrelations, and of the progressive effects of prolonged action of these processes which result in malnutrition, deranged endocrine balances, and even actual pathological tissue changes.

The problem also includes the analysis of the individual patient in terms of heredity, constitutional type, environmental experimental experiences, general health, and his immediate personal problems, which may be the cause of his emotional state.

It is probably true, as the authors suggest, that when the internists have solved these problems, the specialty of psychiatry will have lost its identity; but the internists will then have more on their hands to do than to correlate physical findings with laboratory reports, if they do their full duty to their patients!

DIABETIC SURGERY*

A TEN-YEAR SURVEY

By Irving Wills, M.D.
and
P. A. Gray, M.D.
Santa Barbara

Discussion *by Emile Holman, M. D., San Francisco; William C. Boeck, M. D., Los Angeles; James B. Graeser, M. D., Oakland.*

THE hazards attendant upon surgery in the diabetic patient in the pre-insulin era were such as to cause the surgeon to approach procedures of any nature in this group of patients with grave misgiving. That potential hazards still remain cannot be questioned, but the great advances made in the understanding of the physiology and chemistry of this disease have effected improved methods of treatment and have done much to dispel earlier fears and to furnish a satisfactory solution to the problem.

MATERIAL REFERRED TO IN THIS REPORT

In presenting this survey of diabetic surgery carried out in a small community, it is our purpose to point out the value of close coöperation between the surgical and medical departments, and to express our firm belief that success in the management of the surgical diabetic patient is largely the result of such coördinated effort.

During the ten-year period from January 1, 1927, to January 1, 1937, a variety of surgical procedures have been practiced upon a large group of diabetic patients. In all, 177 (Table 1) operations have been done on patients selected from the Metabolic Service of Dr. W. D. Sansum at the Santa Barbara Cottage Hospital and the similar service of one of us (P. A. Gray) at the Santa Barbara General Hospital. These patients represent a cross-section of private and charity clientele, showing all grades of severity of diabetes, and the operations performed are a cross-section of those to be encountered among such a group of patients.

PREDISPOSING SURGICAL FACTORS

It is a well-known fact that surgical conditions arise in the diabetic more often than in the non-diabetic patient. Among the factors responsible for this are (1) the age of the patient, (2) increased susceptibility to infection, (3) the frequent occurrence of acidosis, (4) delayed healing, and (5) cardiovascular-renal disease. In other words, the diabetic patient not only is liable to any disease to which anyone else in his age group is subject, but also, because of his diabetes, has a pronounced tendency to gangrene and infection. We feel, therefore, that the apparently higher mortality in this type of surgery is not due to the disturbed metabolism *per se;* and that diabetes adequately controlled should not materially influence the surgical risk. This belief has been borne out not only in our experience, but also in that of surgeons in the larger clinics.

* Read before the General Surgery Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

IMPORTANT SYMPTOM COMPLEX

Although this paper is not concerned primarily with surgical diagnosis, mention should be made of a diagnostically important symptom complex peculiar to the diabetic. While the student of diabetes is well acquainted with the picture of the "acute abdomen" simulated by diabetic acidosis, the general surgeon has little opportunity to study this interesting picture. Beardwood [1] and Baker [2] have recently reviewed this syndrome. Diabetic acidosis may produce a clinical syndrome resembling exactly the "surgical" abdomen, with nausea, vomiting, localized rigidity, fever and leukocytosis and, upon occasion, pyuria and hematuria. Case 1, cited below, is an illustration in point. This phenomenon has been explained upon several bases: (1) a sodium chlorid deficiency, (2) acute pancreatitis, (3) reflex irritation from spinal centers, and (4) gastric dilatation. Of these four hypotheses, the first has impressed us most. The symptoms described can be reproduced by states of dehydration and mineral deficiency paralleling those known to exist during diabetic coma. Relief of the abdominal pain has followed the intravenous administration of normal or hypertonic saline solution before the acidosis has been eliminated or the blood sugar lowered.[3]

Since diabetic acidosis alone may simulate a variety of surgical conditions in the abdomen, and since coma may equally well be precipitated by a pyogenic process in the abdomen, the differentiation between primary and secondary coma in a patient presenting abdominal symptoms becomes a nice diagnostic problem. The risk of operating upon patients in acidosis is such as to deter the surgeon from immediate operation, even though the patient may be admitted with abdominal symptoms. Almost any surgical condition, even a ruptured viscus, will permit of an hour or two delay. In this interval energetic treatment with fluids, sodium chlorid, glucose, and insulin should reduce the ketosis. If after a reasonable period there has been no change in the abdominal picture, or if it has become worse, exploration of the abdomen is justified. If, however, the nausea and vomiting have ceased, the abdominal pain and rigidity have vanished, and the fever subsided, surgery may wisely be postponed.

Since the leukocytosis may be due to hemoconcentration, estimation of hemoglobin and red-cell count, as well as the leukocyte count, should be made on admission and at frequent intervals thereafter. As the patient's water balance is restored with fluids, the total white count should fall. If it does not, we regard this as evidence of infection.

Table 1 shows that 177 major and minor operations have been done. The majority of the majors have been done by one of us (Irving Wills) and his surgical associates. This group will be considered predominately in this report. Especial consideration will be given to the groups of amputations and laparotomies.

PERIPHERAL CIRCULATORY COLLAPSE

From the metabolic viewpoint the gravest risk involved in diabetic acidosis is peripheral circulatory collapse, or so-called "medical shock." Peters [4,5] and Atchley [6] and their associates have studied the biochemical changes occurring in diabetic acidosis in elaborate detail. Lande,[7] Lawrence,[8] and others, have contributed to our knowledge of this clinical picture. Moon [9] has discussed the fundamental physiological unity of both medical and surgical shock. Understanding of the chemical and physiological processes involved will not only facilitate the management of the patient in diabetic coma, but also arm the surgeon against the complication of vasomotor collapse. The studies cited have shown fairly well that the clinical picture of shock results from a discrepancy between the volume of the vascular tree and the blood which it contains. In diabetic ketosis this discrepancy is due to the reduced blood volume consequent to the extreme dehydration. (Chart 1 illustrates the sequence of events diagrammatically.) Dehydration, hyperventilation, and cooling contribute to peripheral circulatory collapse. The first of these three factors can and should be combated by large volumes of fluid, preferably saline, to restore the depleted mineral base, which fluid can be given intravenously. Whole blood or acacia solutions, with their higher osmotic pressure and, hence, less likelihood of escaping through the capillaries damaged by anoxemia, may be preferable in emergencies. The second factor will disappear as the alkaline reserve is raised, and the third factor can be combated by the external application of heat. The patient's blood pressure is an excellent and simple clinical guide to the presence or absence of peripheral circulatory collapse, and should be incorporated into the routine care along with the blood sugar and CO_2 determinations. As already noted, we have recorded it at frequent intervals in all cases. Since the fundamental metabolic defect in this picture is dehydration, adequate amounts of fluids intravenously are freely justified.

AMPUTATIONS

The subject of amputations will always occupy a place of primary importance in diabetic surgery because of the frequency of gangrene and infection. These complications will probably remain prevalent because of the high incidence of arteriosclerosis, and the fact that a fairly large number of mild cases of diabetes go unrecognized and untreated year after year. In the surgical treatment of gangrene we see no particular advantage in making a distinction between the dry and the moist varieties, aside from the fact that the dry type usually does not present such an acute problem. To consider this type as uninfected is likely to invite trouble. It has seemed more rational to consider both types of gangrene as potentially infected, to determine if possible the presence or absence of septicemia, to examine the extremity carefully for signs of lymphangitis, and to suit and time the operation to the conditions present.

A high amputation has been the operation of choice in most of the cases. The advanced age of most of the patients, coupled with the inadequacy of their circulation, as demonstrated by oscillometric readings, makes this apparently radical procedure the one of choice.

Although most of our amputations have been through the mid-thigh, we have come to favor for selected cases the Callander modification of the Stokes-Gritti operation. This procedure possesses certain definite advantages, in that it neither exposes nor injures the muscle bellies, thus reducing the probability of infection. Furthermore, it gives a good weight-bearing stump without the necessity of uniting the patella with the end of the femur, as is the case in the Stokes-Gritti operation. In infected cases, showing advanced lymphangitis, a guillotine amputation above or below the knee may be a definitely life-saving procedure. It is our opinion that the patient's ability to walk later should not be given too much consideration when an amputation is contemplated. The life expectancy of many patients suffering from gangrene is short at best, and this fact, coupled with the increased risk of a subsequent higher amputation, does not justify the attempts often made "to save as much as possible." For those patients who are otherwise able to use it, a satisfactory prosthesis can be obtained to fit the high amputation stump. An analysis of the subsequent course and life expectancy of the patients in this group will be presented in a later communication.

The elaborate preparation of the leg for amputation has received considerable attention by various writers. We have been opposed to any active scrubbing or manipulation of the part, feeling that the milking action incident to vigorous cleansing may tend to spread bacteria from the unclean zone into an otherwise clean area. Our practice has been to cover all but a minimum amount of skin at the site of amputation and prepare this area with a generous coating of tincture of iodin. No other preparation has been used or considered necessary. The tourniquet has never been employed because of its devitalizing effect on the tissues and of the tendency to late oozing. By working as a team, the surgeon and his assistant can control hemorrhage so that only a relatively small amount of blood will be lost. Drainage, which was formerly used routinely, has not been employed recently. The wounds have been closed loosely with only a few interrupted sutures in the fascia and silkworm in the skin.

No special diabetic preparation other than control of ketosis when present has been necessary for those patients about to have an amputation. An adequate amount of fluid by mouth or hypodermoclysis has been insisted upon. Since about half of the amputations have been done under spinal anesthesia, especial check upon the blood pressure has been kept postoperatively. The first regular meal hour after operation has usually been omitted; thereafter the usual diet, converted into soft foods and liquids, has been served. Insulin has been given on a four-hour schedule, the amount depending upon the blood sugar, which should be kept between 100 and 150 milligram per cent.

LAPAROTOMIES

Most of the laparotomies performed have been elective and, needless to say, on patients that have been carefully selected. These patients have represented, for the most part, individuals from the "middle class" who have been under continuous diabetic supervision. In acute abdominal conditions, such as appendicitis, the importance of early operative interference cannot be stressed too greatly. Control of diabetes is difficult in the presence of acute infection, and the insulin requirement is temporarily increased. Drainage of the wound has been effected in these cases the same as in nondiabetic patients.

Whenever possible, laparotomy patients have been hospitalized several days prior to operation. Normal blood sugar levels have been considered desirable, but have not always been practicably obtainable. No patient has been allowed to go to surgery with a CO_2 level below normal. Fluids have been forced the day or days prior to operation, and 5 per cent glucose in normal saline solution has been given by hypodermoclysis the morning before surgery. (Table 2 shows the type of anesthesia which has been selected in this group of patients.) After the operation the patient's blood pressure has been taken at hourly intervals, the blood sugar determined at two hourly intervals (usually by the Folin-Wu method on capillary blood), and the urine tested whenever available. Because of the risk of infecting the bladders of diabetic patients,[10] we have refrained from catheterizing the bladder for the purpose of obtaining specimens.

On the first postoperative day a minimum of 3,000 cubic centimeters of fluids have been administered by vein or hypodermoclysis. At least 100 grams of glucose have been given as 5 per cent glucose in sodium chlorid solution the first twenty-four hours. A sufficient amount of insulin has been given to hold the blood sugar between 100 and 200 milligram per cent. Patients whose stomachs or bowels have been incised have received nothing by mouth for forty-eight hours. Others

Table 2.—*Anesthesia Selected*

	Spinal	Gas-Oxygen	Gas-O_2-Ether	Local	Ether	Gas-Amytal (Ether)

Amputations	12	10	9	3		3

have received fluids (water, ginger-ale, sweetened tea, and water-packed pear juice, flavored with lemon) on the second day. Also on this day skim milk and white of hard-cooked egg have been given to some patients. On the third day, broth and junket have been added. On the fourth or fifth day, pureed bland fruits and vegetables, rice, potatoes, and melba toast have been permitted. Postoperative "gas" pains have been no more troublesome in this group of patients than among the nondiabetic group. The total calories fed per day have not exceeded 1,500 in any case as long as the patient remained at bed rest.

Each day enough fluid has been given to equal the volume of the twenty-four-hour urine specimen, plus 1,500 cubic centimeters (to allow for perspiration). In the more severe cases, insulin has been given every two hours in doses of five and twenty units; in the milder ones, every four hours in similar doses.

Preparation of the skin for laparotomy has been the same as for the nondiabetic patients, and since we have only one instance of wound infection (in the County Hospital), our technique may be assumed to have been adequate.

Included in this group of patients are four instances of cesarean section (done on primiparae) by Dr. L. F. Eder. Three of these included sterilization. There has been no maternal mortality, and only one fetal death from a congenital cardiac anomaly. The postoperative course of these four patients presented no unusual surgical problems. Control of their diabetes was maintained by capillary blood sugar determinations at two-hour intervals.

No surgical mortality has been encountered among the thirty-five patients who have undergone laparotomies. All left the hospital in good condition. Some have died since from causes unrelated to the surgical procedure practiced.

ANESTHESIA

Anesthesia is a subject about which there has always been considerable diversity of opinion, but with a better understanding of the action of the various anesthetic agents on carbohydrate metabolism those experienced in the surgery of diabetes have come more and more into agreement in the past few years.

Procain preparations, whether used intraspinally or as local infiltration, apparently have no deleterious effect on metabolism. Nitrous oxid and ethylene interfere in the carbohydrate metabolism, as shown by elevation of the blood sugar, accumulation of lactic acid in the blood and reduction of the alkali reserve of the blood.[11] However, these changes are slight if the duration of the anesthesia is not prolonged. Although nitrous oxid combined with ether produces even more marked changes, it may still be used safely if steps are taken to combat the ensuing acidosis. Ether should be used sparingly upon the diabetic patient. Although desirable from a chemical point of view, local infiltration of tissues may be undesirable from a mechanical one, because the devitalizing effect of the trauma to the tissues will favor the development of infection. Nitrous oxid and oxygen give poor relaxation, hence are unsatisfactory for most abdominal procedures. Our preference for all operative procedures on the lower extremity, perineum, lower urinary tract and lower abdomen has been spinal anesthesia. We have used 50-150 milligrams of novocain, dissolved in 1 to 3 cubic centimeters of spinal fluid, depending on the height and duration of analgesia desired. Ephedrin has been used routinely as a pre-anesthetic medication. In the upper abdomen we have usually used local infiltration of the skin combined with nitrous oxid and oxygen. In the younger patient who is free from demonstrable cardiac disease, spinal anesthesia may occasionally be used here as well.

For operations about the head and neck, including thyroidectomy, local infiltration, nitrous oxid or a combination of both have been preferred.[12-21]

REPORT OF CASES

Case 1.—F. H., a girl, age eleven, had had a severe grade of diabetes for two years. Dietetic control had been imperfect. Twenty-four hours before admission to hospital she developed pain in the right lower quadrant of the abdomen, associated with nausea and vomiting. Insulin had been discontinued. On admission she was comatose. Body temperature was 101 degrees, respiration 30, pulse 35. The skin was dry. No cyanosis was observed. The breath reeked with the odor of acetone. The abdomen was soft, except in the right lower quadrant, where tenderness and rigidity were present. The urine contained albumen 4 plus, sugar 4 plus, acetone 4 plus, and diacetic acid 4 plus. The blood sugar was 440 milligram per cent, and the carbon dioxid combining power of the plasma 24 volume per cent. The blood count was: Hemoglobin, 97 per cent; red blood cells, 4,740,000; white blood cells, 23,350.

One and one-half hours later all spontaneous pain had left the abdomen, and no rigidity nor tenderness could be detected over McBurney's point. Her temperature had fallen to 98 degrees. After four hours her condition was greatly improved. The white blood count had fallen to 19,600. The urine contained sugar plus, acetone plus, diacetic acid 0. The blood sugar was 184 milligram per cent. Eighty units of insulin and 1,000 cubic centimeters of normal saline solution had been given. Recovery was uneventful. There has been no recurrence of the right lower quadrant pain to date.

* * *

Case 2.—C. M., woman fifty-seven years old, was known to have had diabetes for five years. For five months before admission she had suffered from recurrent attacks of "acid type" of pain in the epigastrium one hour after meals.

Vomiting had brought relief. This had increased in frequency recently. Normal acid values for gastric juice were obtained. No abdominal mass could be palpated. Blood counts and the blood chlorid were normal. Gastro-intestinal x-ray examination revealed a highly obstructing lesion at the pyloric end of the stomach. Laparotomy under gas-oxygen ether revealed a greatly enlarged stomach, with a thickened and edematous wall. There was a firm cicatrix involving the first portion of the duodenum and completely obliterating the lumen. Posterior gastro-enterostomy was done. Sections of an adjacent lymph node revealed no evidence of malignancy. The incision healed by first intention and the postoperative course was uneventful.

Repeated gastric lavage had kept the stomach empty for several days prior to operation. One hundred to one hundred and fifty grams of glucose had been given daily (as 5 per cent glucose in normal saline). To each intravenous injection five units of insulin had been added. No food or fluid was given by mouth the first twenty-four hours after operation, and only chipped ice the second. Two thousand to three thousand cubic centimeters of 5 per cent glucose in normal saline were given each of these days. Forty-five units of insulin were required the first postoperative day and eighty the second, in order to keep the blood-sugar level (taken at four-hour intervals) below 200 milligram per cent. On the third day, skim milk and water were tolerated by mouth, and subsequently the usual bland diet. The diabetes was controlled at discharge with a maintenance diet and ten units twice daily.

* * *

Case 3.—M. S., a woman, age fifty-one years, had been under treatment for diabetes mellitus for one year prior to surgical interference. She had been sugar-free on a diet of C. 407, P. 110, F. 103, calories 2,995, with insulin units 18-3-10 daily. Attacks of sharp pain in the right upper quadrant of the abdomen, radiating to the shoulder blade and associated with nausea and vomiting, had been frequent. She had never been jaundiced. Three attempts to elicit a gall-bladder shadow by oral administration of dye had failed. A normal icteric index and bromsulphthalein test had been obtained. Cholecystectomy was done under local and gas-oxygen anesthesia. A "white" gall bladder attached to the duodenum with adhesions was removed. The incision healed by first intention and the postoperative course was uneventful.

On the morning of the operation, the patient's usual insulin dose and breakfast were omitted. She received 1,000 cubic centimeters of 5 per cent glucose in normal saline solution plus 10 units of insulin before going to the operating room. On the first postoperative day, 45 units of insulin and 165 grams of glucose as 5 per cent glucose in normal saline were given. On the second day, 1,100 cubic centimeters of the bland fruit juice and water were tolerated by mouth; in addition she received 2,000 cubic centimeters of normal saline by hypodermoclysis. On this day 35 units of insulin were required. On the third postoperative day, 35 units of insulin and 3,250 cubic centimeters of fluids were given. On this day, also milk, bouillon, junket, and egg white were tolerated by mouth. At discharge from the hospital the diet was: C. 286, P. 104, F. 71, calories 2199. She was sugar-free with insulin 22-7-19 units.

* * *

Case 4.—E. G. A., woman, age fifty-six years, had had diabetes for twenty-two years. Diet had not been followed and insulin had been refused. She had had an infected "corn" on the right fifth toe for one year. Pus had drained from this lesion intermittently during that time. One week before admission the calf of the right leg had become swollen and painful and the skin red. At the same time a tender swollen mass had appeared in the left forearm. Heat had been applied to the forearm. Blisters had resulted over the volar surface and at the elbow. Thirst, appetite, and urination had increased perceptibly the week before admission.

On admission the entire left forearm was swollen, red, and tender. Many oval necrotic areas were present on this surface and one covered the elbow. The forearm was flexed 90 degrees on the upper arm. The patient could not close her fingers. The fifth toe and lateral surface of the right foot were bluish black. Pus exuded from the base of the fifth toe. The dorsum of this foot was edematous. A hard, tender mass was present in the bellies of the gastrocnemius muscle. No red streaks were noted, but enlarged, tender glands were found in the right groin. Body temperature on admission was 100.8 degrees. The urine contained sugar 4 plus, acetone 3 plus, and diacetic 2 plus. The blood sugar was 590 milligram per cent. The white blood cells were 14,650.

The patient was prepared for surgery in the usual fashion. Three days after admission a Callander amputation was performed under spinal anesthesia. The whole posterior aspect of the removed leg was found to be diffusely infiltrated with pus. Healing was uneventful.

Fifteen days after admission the lesion in the left forearm had become localized. Through and through drains were inserted after incision and evacuation of pus. Healing was uneventful. The patient was discharged from the hospital controlled on C. 167, P. 76, F. 82, calories 1,710, with 25 units of insulin twice daily.

CONCLUSIONS

Analysis of the chemical, physiological and mechanical problems presented by surgical treatment of the diabetic patient suggests certain conclusions:

1. The surgical diabetic patient is primarily a medical problem.

2. The surgeon must be "diabetes minded," and willing to work in close coöperation with the internist.

3. A thorough understanding of acidosis and peripheral circulatory collapse is essential to successful treatment.

4. The choice of anesthetic should be individualized.

5. Diabetes in the surgical patient should not greatly influence the operative risk.

DISCUSSION

Emile Holman, M.D. (Stanford University Medical School, San Francisco).—Only complete agreement with the authors is possible in their able treatment of the need of fluids, and more fluids, in the care of the diabetic. Too often but a minimum attention is paid to the importance of maintaining in all conditions of illness or operative care an adequate fluid supply to insure a proper balance between intake and output. It is only recently that total blood volume has been accorded the importance it deserves, particularly in the period of water deprivation that precedes any operation to be performed under a general anesthesia. Patients are denied replenishment of body fluid at the time of greatest need. Accordingly, it cannot be too strongly emphasized that before any major operation the deprivation of water by mouth should be counteracted by either subcutaneous or intravenous infusions—given *before* operation as well as *after* operation.

The site of amputation is determined by the extent of infection, the severity of arteriosclerosis, the degree of patency of arteries and, obviously, by the amount of demonstrable gangrene. Occasionally, in the presence of a partially gangrenous digit, largely the result of infection which has developed in spite of palpable dorsalis pedis and posterior tibial arteries, we have been content to control the diabetes, and later perform an amputation of the toe. Gangrene and infection of the foot occur on occasion in the presence of a very vigorously beating popliteal vessel. Amputation below the knee has been performed and good healing obtained. Mid-thigh amputations are obviously preferable in elderly patients, with extensive obliteration of the vascular tree.

❦

William C. Boeck, M.D. (1919 Wilshire Boulevard, Los Angeles).—This paper, recounting the experience of the authors in the medico-surgical treatment of diabetic patients requiring operation, illustrates most beautifully how excellent results are obtained by the coöperation of the internist and surgeon. These splendid results in this study were secured because both the internist and surgeon were familiar with the fundamental necessities of the preoperative, operative, and postoperative care of the diabetic patients, not only from the medical but from the surgical viewpoint as well. It follows, therefore, that while it is desirable for internists and surgeons to coöperate in the care of these diabetic surgical patients, yet the results will not be ideal if either one is lacking in the knowledge required of each. The internist should know the medico-dietetic management of diabetes in order that the diabetic state may be balanced and controlled, and that any disturbance in body chemistry may be completely corrected, or as nearly as possible. The surgeon, on the other hand, must also have this knowledge in part and, above all, should have had experience in diabetic surgery. This will enable him to make a wise selection of the type of anesthesia, operation, and with the internist he will see that the postoperative care is proper in order to avoid complications and possible death from coma.

Fortunately, most operations upon diabetic patients are elective, and only occasionally is an emergency operation necessary. Therefore, there is adequate time to control the glycosuria of the patient by diet and insulin if necessary. No patient should be submitted to operation unless his diabetes is well under control. If this is not done, and the operation is performed while there is marked glycosuria and a high blood sugar, acidosis and probably coma will ensue postoperatively, since operations like infections increase the severity of the diabetes.

It follows that diabetic patients who have been operated upon must be followed closely after operation and their glycosuria cleared up by adequate insulin dosage, along with the other items of postoperative care as given in this paper. I do not feel it is necessary, however, to do this by repeated blood-sugar determinations as practiced by the authors. On our own diabetic service we find it only necessary to have blood-sugar determinations at four to six hours postoperatively, perhaps again at ten or twelve hours, and then at intervals of twenty-four hours. We are able to ascertain the diabetic state by urinalysis for sugar alone, and prescribing insulin as necessary at intervals of one or two hours. In order to carry out such examinations, we employ indwelling catheters in our patients, and to date there have not been any urinary infections following such procedure.

I wish it were possible for all diabetic patients to have the coöperation of both internist and surgeon whenever surgery, such as was accorded the patients upon which this paper is based, is necessary. Too frequently the surgeon acts alone, and asks the dietitian for a "diabetic diet" with no prescription as to carbohydrate, protein and fat constitution. Insulin is given, but often not enough to control the glycosuria, or to clear up the acidosis before the operation is performed, with the results that the patient may never awaken, death occurring from diabetic coma. It is sad, indeed, to know such occurrences are still taking place in some of our hospitals, for it is no improvement over pre-insulin days. Too bad, perhaps, that the surgeon was not familiar with the book "Diabetic Surgery," written by McKittrick and Root. Would it be asking too much if the hospitals had, as a requirement, that all diabetic patients who are to be operated upon must have consultation from an internist trained in diabetic management, even as we make it mandatory that internists consult upon cases of therapeutic abortion? Certainly, the demand is equally as important from the standpoint of the patient, the hospital, and the physician in charge.

❦

James B. Graeser, M.D. (2940 Summit Street, Oakland).—Although general principles of procedure may be discussed in a paper of this type, it is impossible to summarize or present accumulated experience, except in its broader aspects. As stressed by the authors, success in this particular field is dependent upon the combined effort of the internist experienced in handling diabetes under surgical conditions and the surgeon who is "diabetically minded." In elective operations a severe diabetic may be prepared for operation and controlled in the postoperative period with but little disturbance. The emergency operation in poorly controlled cases, on the other hand, presents a hazard greatly increased by the diabetic factor.

The authors' discussion of the postoperative care of laparotomies presents a model procedure.

MEDICINE AND NATIONAL POLICY*

By Morris Fishbein, M.D.
Chicago, Illinois

SINCE the earliest times the care of the public health has been recognized as of the greatest importance in the maintenance of any nation. As long ago as 1875, Dr. Henry Bowditch suggested that the American Medical Association support the appointment of a Minister of Health in the cabinet, and this was adopted by the House of Delegates in 1876. Today it is recognized that our government—federal, state, and local—is already intimately concerned in matters of health. Of the two million beds available for medical care, almost a

* A digest of the address given at the annual meeting of the Los Angeles County Medical Association on December 2, 1937, by the editor of *The Journal of the American Medical Association*. From the *Bulletin* of the Los Angeles County Medical Association.

million are in government-controlled institutions. Our federal departments have many medical functions such as the United States Public Health Service in the Treasury Department, the Food and Drugs Administration under Agriculture, Maternal and Child Welfare in the Labor Department, the care of the Indians and institutions for the insane in the Interior Department, Coast Guard in the Department of Commerce, and many other functions scattered under some of the special commissions. Yet today the vast majority of the care of the people of the United States in illness rests on the practitioners of medicine, a burden which they have voluntarily assumed and one which they do not propose to relinquish until they are satisfied that some other system will give better medical service to more and more people.

FOREIGN STATE-CONTROLLED SYSTEMS OF MEDICAL PRACTICE

In the organization of many foreign nations state-controlled systems of medical practice have been introduced to meet conditions which prevailed among their peoples. There is no good evidence that any one of these systems is yet recognized as an answer to the problem of adequate medical service for all of the people. The most that can be said for any of them is that it is an improvement on what those people had before. Today under our system of medical care we have the lowest rates for death, for infant mortality and for most of the infectious diseases that prevail anywhere in the world. Is there any good evidence that a radical change in our plan of medical care would bring about still further advancement? Actually the evidence seems to indicate that any fundamental revolution would depreciate the quality of medical care, inhibit initiative, and at the same time vastly increase the costs of the service rendered.

EVOLUTION OF MEDICAL PRACTICE IN AMERICA

Our system of medical care is a logical evolution of personal medical practice to meet every need as it has arisen—a process of evolution which still goes on, adapting itself smoothly to the needs of the new mechanized civilization. For every new problem organized medicine has developed its advisory councils, and these have consistently sought for higher standards and a wider application of the best available medical care. The Council on Medical Education and Hospitals has done more to raise the standards of medical education and hospital service than any governmental agency has accomplished or could accomplish. It accomplishes more by voluntary action with high ideals that could be achieved by any federal agency slowly unwinding the red tape of governmental inspection, and forcing action by the labored processes of legal procedure. Education and voluntary action in the field of health have invariably brought about great reforms with more facility than have been achieved by the pressure of confused, hasty and unscientific legislation.

THE FERMENT OF 1927: WHAT IT HAS GIVEN US

Since 1927 a ferment has been agitating the medical scene. It is the new concept of social service and the apotheosis of the so-called underprivileged. It is a social philosophy which places the needs of four or five million indigents, many of them trained to indigency by superlative coddling, above the health and welfare of forty million workers and their families. The campaign has been waged with abuse and vilification of the medical profession, with blandishments and appeals to cupidity, with slogans and with threats. We have heard that "everyone is entitled to the best of medical care for a price that he can afford to pay," an ideal never yet realized in any nation or in any community in this world. We have been told that the "doctors must develop a plan or the Government will develop one for them." In response the physicians have developed hundred of plans now being tried in many communities, knowing that there is no single formula or ritual that will answer for every community any more than there is a panacea for every syndrome or complication of symptoms.

SOME "FOUNDATION PROPONENTS" OF COMPULSION HEALTH INSURANCE

The Milbank Foundation promoted compulsory sickness insurance, spending many hundreds of thousands of dollars in its promotion, and it has departed from such propaganda as one of its functions. The Rosenwald Foundation has spent equally for at least a decade in promoting hospital insurance, and today less than one per cent of our population has chosen to avail itself of such insurance and the Rosenwald Foundation has closed up its department of medical service. Mr. E. A. Filene urged a half-dozen different panaceas through the Twentieth Century Fund, and the latest activity of that group has been the development of coöperatives for medical care among employees of the Home Owners' Loan Corporation and among employees of the Federal Farm Loan Banks, with the concept that a few physicians employed full time can give adequate medical care to many thousands of people on a contract basis. No one has ever demonstrated that any such a system of medical care even approximates in quality the kind of medical service that is available to the majority of workers in the United States with even less income than is given to these employees of the Government.

AMERICAN FOUNDATION STUDIES IN GOVERNMENT

Now come the principles and proposals emanating from the studies of the American Foundation Studies in Government. Behind these principles and the signatures of the 430 physicians who signed them is a record of political manipulation which should be better known to the medical profession and to the people. This manifesto has been heralded as a "revolt" in the American Medical Association in behalf of state medicine. Yet in a

period of six months there were only 430 signitures and already great numbers of the signers have withdrawn their names. Today we know that the circulation of this manifesto was planned and designed to impress the executive and legislative branches of our federal government with the view that the American Medical Association is disorganized, nor representative of medical thought throughout the nation, and opposed to the best interests of the people. Who may profit from such evidence of disorganization? Is there any proof that self-appointed Committees of Physicians are any better able to represent the opinion of the American medical profession than the democratically chosen House of Delegates of the American Medical Association? The representatives of the 106,000 physicians who constitute the membership, the largest in the history of the Association, actually 80 per cent of the reputable practicing physicians of our country, have declared themselves opposed to any fundamental change or revolution in the development, distribution or payment for medical service. They await evidence from some of the many plans now undergoing experimentation in various places, that a new technique is desirable and safe for the people. That is the scientific method.

MINISTER OF HEALTH IN THE PRESIDENT'S CABINET

The impression has been circulated that the American Medical Association opposes a Minister of Health in the Cabinet. This is absolutely untrue, and represents again the manner in which truth is manipulated to place the medical profession in an unfavorable light. In reorganization of our federal government affairs at least three proposals have been made relative to the place that should be occupied by medicine and the care of the public health. What medicine fears is the possibility of a single ministry to be concerned with the care of the indigent, unemployment, social service, education and public health. Here there is the possibility a single Minister of Indigency may be made superior to health or education. Out of such an establishment will come inevitably worse confusion and less efficiency than we have ever had in the past.

SCIENTIFIC PLANNING NEEDED

Obviously what is needed now is not a *plan*, but *scientific planning*. At its annual session in June, 1937, the American Medical Association reaffirmed its willingness to do its utmost today as it has in the past, to provide adequate medical service to those unable to pay either in whole or in part. It has urged that in every county the county medical society take the leadership in calling into coöperation health departments, community chests, and social service organizations, to ascertain the needs in that county and to work out suitable provisions for meeting those needs. In June, 1937, the American Medical Association officially reaffirmed its willingness on receipt of direct request to coöperate with any governmental or other qualified agency and to make available the information, observations and results of investigations together with any facilities of the Association. Thus far no call has come from any governmental or other qualified agency for the coöperation of the American Medical Association in studying the need of all or of any groups of people for medical service, or to determine to what extent any considerable proportion of our public are suffering from lack of medical care. The offer still stands as evidence of the willingness of the American Medical Association to aid in finding solutions for the problems that now prevail.

WORK OF COUNTY MEDICAL SOCIETIES

In many places throughout the United States today county medical societies already assume fully the burden of medical care for the indigent. In some places, under the leadership of county medical societies, all agencies concerned with the care of the sick and with preventive medicine, are working on plans to extend such care and at the same time to avoid duplication, inhibit waste, and prevent neglect. The Social Security Board, charged with the handling of unemployment and old age insurance, is making extensive studies of sickness and its care, although not yet has there been any report from that body as to the needs of the people or any recommendation as to how these needs shall be met. If the answer is to be sickness insurance, as it has been intimated the Dodd report would have recommended in California, let it be remembered that under such a system the burden falls wholly, after all, upon the worker. He pays up to 3 per cent of his wages, the employer contributes an additional sum which is then added to the costs of goods that the worker buys, and finally the Government contributes a portion out of the taxes that the worker pays. The end-result is a bureaucracy with two new government employees for every physician who gives medical service, and a system of red tape which diminishes the amount and quality of service that the physician can give. And when the bills become too great the government makes it even by diminishing the amount of money paid to the doctor for his service, or by recommending that the patients have less attention and less medicine for the illnesses covered by the system.

AMERICAN MEDICINE TODAY

American medicine, now superbly organized on a democratic basis, speaking with the voices of more than one hundred thousand physicians, promises again to do its utmost in coöperating with all of the other agencies now available to supply a high quality of medical service for all of the people. In doing so, however, it must conserve those features of medical practice which time and training and experience have shown to be absolutely essential to a high quality of medical care. The best results will never be achieved by a revolution in the organization and administration of medical service. They must come by a steady, persistent evolution.

535 North Dearborn Street.

CALIFORNIA VENEREAL DISEASE CONTROL PROGRAM *

By Malcolm H. Merrill, M.D.
San Francisco

IT was in 1492 that syphilis was introduced into Europe. This disease raged entirely unchecked for over four hundred years. It was 1837 before it was finally demonstrated that syphilis and gonorrhea were two different diseases. In 1879, the minute germ which causes gonorrhea was discovered. The pale, thin spiral-shaped germ which causes syphilis was discovered in 1905 by a young German scientist by the name of Schaudinn. The blood test used in the diagnosis of syphilis was devised in 1907, and salvarsan, the drug which has proved so highly effective in the treatment of syphilis, was finally prepared in 1910. It was called 606 because 605 preparations were prepared and tried before the effective drug was found. We now have compounds containing arsenic that are closely related to salvarsan and are less toxic and almost equally as effective. In 1922, it was discovered that bismuth compounds were also highly effective in the treatment of this disease. During the years since then extensive investigations have shown the amount and duration of treatment necessary.

CAUSES KNOWN

We have known for twenty-five years the cause of these diseases; the mode of transmission or how they are spread; how they can be prevented, and in the case of syphilis we have had highly effective methods of treatment. For years we have had all the scientific information about these diseases that is necessary for their eradication. This is particularly true with regard to syphilis. Yet, what have we accomplished? While the application of our knowledge has worked wonders in the control of smallpox, diphtheria, typhoid fever and tuberculosis, the venereal diseases have continued to run rampant. These diseases, and particularly gonorrhea, are almost as prevalent today as they were at the turn of the century.

'Way back in 1895 there were instances of agitation for control measures by occasional physicians. But these received little attention. A pamphlet was prepared by the United States Public Health Service in 1908 in which these diseases were very conservatively discussed, but the pamphlet was returned, disapproved by the Secretary of the Treasury, with the following comment: "The matter contained in this bulletin is not in keeping with the dignity of the fiscal department of government."

FIRST EFFORTS IN CALIFORNIA

Feeble efforts at control were begun in 1912. In California, reporting was begun and a modest educational campaign was launched. However, little headway was made anywhere until the war. Then a nation-wide control movement was undertaken. Definite programs were developed in forty-six states under federal direction. The Bureau of Venereal Diseases was established in California in 1917 and then followed three years in which there was an extensive control campaign. A number of clinics were established. Wide publicity was given the movement and the incidence of the venereal diseases was undoubtedly held down as a result of this work. At that time, however, newspapers and popular periodicals were extremely hesitant in their discussion of the problem.

POST-WAR PERIOD

At the end of the war all federal funds were withdrawn and coördinated campaign collapsed. As occurred in other states, in 1920 the California State Department of Public Health was forced, because of lack of funds, to abandon its Bureau of Venereal Diseases. Despite this collapse of coördinated activity there remained throughout California a number of islands of activity in the form of programs within local health departments, for example, in San Joaquin County, San Diego, Long Beach, Los Angeles, and San Francisco. The activity of these local departments has continued since that time. Beginning about 1926, scientific interest in these diseases began to be intensified, and during the last ten years, under the direction of the United States Public Health Service, a tremendous amount of extremely valuable data has been collected. With the recent advent of Dr. Thomas Parran as Surgeon-General of the United States Public Health Service, a nation-wide campaign was begun. Fortunately, some funds were provided through the Social Security Act to make the movement possible. Of the eight million dollars allotted to the United States Public Health Service, approximately one million dollars has been allotted to states for the control of venereal diseases. Taking advantage of this, California reëstablished the Bureau of Venereal Diseases in February of this year and a state-wide control program was initiated.

APPROPRIATION BY THE 1935 CALIFORNIA LEGISLATURE

The recent session of our State Legislature adopted legislation and, through appropriation, added to the funds for the carrying on of the program. With the funds available, an active program for California is assured. There is a nation-wide program now under way. Almost every state in the Union is developing a special department for venereal disease control, and the movement is going rapidly forward. The United States Public Health Service is acting primarily in an advisory capacity to coördinate the national program.

In California the State Department of Public Health is similarly acting in an advisory and coördinating capacity to the local health departments. The aim is to assist in the development of effective programs within these local departments.

PREVALENCE OF THE DISEASES

How prevalent are these diseases? During the month of September, 1937, 1,897 cases of gonorrhea and 1,825 cases of syphilis were reported to

* From the Bureau of Venereal Diseases, California State Department of Public Health. Excerpts from an address presented at Veterans Memorial Auditorium, San Francisco, October 21, 1937.

the California State Department of Public Health. If this rate persists throughout the year, it would mean approximately 45,000 cases per year. About 75 per cent of new infections occur before the age of thirty years. From the results of surveys we have run in recent months we are now convinced that not more than 50 per cent of the cases are actually being reported. These same surveys have also indicated to us that there are constantly under treatment approximately 40,000 cases in California, or between four and six cases for 1,000 of population.

MONEY COST OF SYPHILIS AND GONORRHEA

It is impossible to estimate the cost of these diseases to the citizenry of California. It costs over one-half million dollars per year to maintain in our state hospitals patients afflicted with central nervous system syphilis. The cost of treatment of the 40,000 cases that are constantly receiving medical care cannot be estimated, but must be several millions of dollars annually. The loss incident to physical incapacitation and loss of time at work of this large army of people likewise cannot be estimated.

PAST EXPENDITURES

We have been interested in determining how much money is being expended to prevent these diseases. Before the advent of the present campaign the total expenditure by local health departments was approximately $200,000 per year or 3½ cents per capita for the people of the State. With the money now available this has been increased to about 5½ cents per capita. Local health departments that have fair programs under way are expending about 10 cents per capita. Most of this money heretofore has been used in clinic and laboratory service. Little effort has been made to find sources of infection or contacts and get these people under treatment. The Department was interested in knowing where their cases were receiving treatment. It was found that about 75 per cent are under the care of private physicians. Twenty-five per cent were being treated in free clinics. There are approximately eighty such clinics scattered throughout the State where treatments are being given. In July of this year 9,813 patients were under treatment in these eighty clinics.

PUBLIC HEALTH SUPERVISION OF PATIENTS UNDER TREATMENT

It has been found that there is a gross deficiency in the public health control of the 75 per cent of the cases that are under the care of private physicians. Only about 10 per cent of these patients have been reported to the health department, and there has been no coördinated effort to find the sources of infection or contacts in these cases. A large proportion of all patients have been found to lapse from treatment before treatment is completed. Many persons never get under the care of a physician at all, such patients placing themselves in the hands of quacks or attempting self-treatment.

EDUCATIONAL CAMPAIGN NEEDED

In the campaign against tuberculosis, smallpox, and diphtheria, education has been found to be the most important single factor. We have no reason to believe that an exception should be made in this respect in reference to venereal diseases. Consequently, an intensive effort is to be made to inform the public concerning these diseases. The Department wants the public to know the nature of these infections, their cause, how they are spread, and how they are treated. Literature is being prepared for wide distribution. Lectures, motion pictures, newspapers, and posters will be used. All this will help to insure close coöperation between lay organizations, physicians, and public health agencies. A fundamental phase of the educational program is the introduction of adequate instruction in our elementary and secondary schools and colleges. Such courses must be designed to give information about public health in general with venereal diseases being discussed along with other infectious diseases. This educational program is designed for two primary purposes. First, to prevent new infections from occurring; and second, to convince the public at large of the necessity of early medical care once infection occurs.

TREATMENT MUST BE AVAILABLE FOR EVERY PATIENT

Next to the educational program perhaps the most important factor is to assure that treatment is available for every patient. Proper treatment is fundamental in the control of these diseases so that infection may not be spread from the infected to normal individuals. In an effort to assure that treatment is available, clinic service will have to be made more adequate. Standards of treatment and the facilities in the eighty or so clinics are being improved, and the clinic periods are being extended. Free drugs are being distributed to private physicians in an effort to assist them in the care of indigent and part-pay patients. The treatment of syphilis is so effective that if we could bring all cases under treatment at the same time and continue treatment for the prescribed eighteen months to two years our problem would be practically solved.

ELEMENTS IN A STATE PROGRAM

In order to get as many patients as possible under treatment, extensive epidemiological work is necessary. Public health nurses will be assigned to various health departments throughout the State to assist the health officers in case finding and assuring continuation of treatment. You will be interested to know that about 80 per cent of all cases of syphilis lapse from treatment prematurely. This epidemiological work has tremendous possibilities, but also involves intricate problems in human relationships. Tact, care, and a humanitarian outlook are going to be necessary. The vast majority of patients will coöperate if they are made to feel that these are infectious diseases and that our sole interest is in the protection of themselves against late complications of the disease and the protection of their associates against infection. The Department is endeavoring to eliminate any element of social stigma or punishment in this approach. We are adopting the axiom, "What would we do if this were a case of smallpox?" and attempting to ap-

proach the problem in the same wholesome, scientific manner. Legal measures will be necessary, but we feel they will be required in rare cases only. We must have the legal power to enforce quarantine and isolation upon uncoöperative patients who are a menace to the public, especially those engaged in illegal activities. This power will rarely need to be exercised if the patient is made to understand our objectives and the reasons for our insistence upon their receiving treatment and abiding by regulations set down. Coercion must be our last resort, but it must be employed if the protection of the public is involved.

The program for the eradication of the venereal diseases is to be coördinated with other public health activities. This is but one phase of public health work. Heretofore it has been given grossly inadequate attention. In the field of infectious disease control it is the most urgent problem at the present time. Just as from time to time emphasis has been directed to typhoid, diphtheria, tuberculosis and other diseases, it is now being directed to venereal diseases.

CLINIC SERVICE

Next let us consider the problem of clinic service. About 25 per cent of those with venereal disease either cannot or will not pay for medical care. This group must be cared for in free clinics, or where no clinics are available, under some other arrangement.

It is fundamentally a health department function to see that treatment is provided for venereal disease patients. If free clinics meeting adequate standards are operated by county hospital or other agencies, there is no reason for health departments to duplicate this service. Health departments, however, are responsible for seeing that standards are maintained and that the epidemiological work is done in these clinics. As noted before, there are now about eighty clinics reporting to the state department. Some additional clinics in certain rural centers will have to be established and activities of many present clinics extended.

There are a few fundamental requirements that all clinics should meet. These were set forth in a report to clinics some time ago, and need not be given in detail here. The admission requirements, however, are worthy of reëmphasis. The following classes of patients should be admitted:

1. Any patient for initial diagnosis and emergency treatment if found infected.

2. Any patient referred by a private physician for consultation or special tests.

3. Any patient honestly unable to pay a private physician for treatment.

Residence requirements must be completely abolished. There are still a few clinics in the State that refuse to admit patients who cannot fulfill the local residence requirements. The fact that a patient is not a resident of three years' standing does not eliminate that patient as a public health menace.

We are prepared to assist clinics in the following ways:

1. We have prepared clinic record forms for issuance to any clinics desiring to use them.

2. We are rapidly working out plans for further assistance to clinics in the form of drugs, personnel or equipment, depending upon the need and the manifest desire to coöperate.

3. Clinics will be visited periodically and every effort made to assist them in the solution of their problems, medical as well as administrative.

The venereal disease control program of the local health department really centers about the clinic. Personnel from the health department should be in attendance at every clinic period to consult with the patients, check on missed treatments, to investigate contacts of clinic patients and attempt to find sources of infection. Health departments cannot reasonably expect county hospitals or other treatment agencies to relieve them of this work. We would recommend the establishment of a venereal disease registry in every health department. Specially trained nursing personnel will have to be added to a number of departments. We are working on plans for specialized training for this personnel.

INDIGENTS IN RURAL DISTRICTS

The provision of treatment for indigent patients in rural districts is a special problem. As soon as possible we hope to arrange to subsidize local physicians in these outlying districts for the care of these patients. Such cases will be investigated by personnel either from the local health department or from our own staff.

LABORATORY SERVICE

Adequate laboratory service is necessary. As a result of the wide publicity the load on private as well as public laboratories all over the State has markedly increased. Laboratory service for diagnosis must be available for all and, as with clinic service, free tests must be available for indigent patients. This will necessitate the extension of activity on the part of some local health departments.

A system of checking on state laboratories on a nation-wide basis has recently been developed by the United States Public Health Service. We plan to carry out the same general system on a state basis in California. The State Laboratory personnel is being sufficiently expanded to take care of this work.

THE HOPE OF THE PRESENT CAMPAIGN

The program in 1917 collapsed because it was built from the top down. It was more or less pushed onto the people by governmental agencies. The present program already has the support of the great mass of the people upon whose support the success of the movement essentially depends. It has the hearty endorsement and coöperation of the press, which was woefully lacking in 1917. With continued support progress in the control of these diseases can be effected.

The physician-health department relationship is not a one-sided affair. Health departments can be of definite assistance to physicians in the care of their venereal disease cases. We can assist them in keeping these cases under treatment. We can return their cases to treatment if lapses occur. We can render direct assistance to the physician by pro-

viding drugs. In return the physician can assist us by coöperating in the epidemiological work.

We believe that if we attack this phase of the problem tactfully, vigorously, and with sincerity of purpose, the physicians will rally to our support.

SUMMARY

1. Efforts are to be made to enlist the coöperation of physicians in reporting and in epidemiological investigation.
2. We are to endeavor to insure adequate clinic service by coöperation with and assistance to clinics. We may need to establish some new clinics.
3. Provisions are to be made for the care of indigent patients in rural districts.
4. Serodiagnostic laboratory service is to be standardized and, where necessary, extended.
5. Epidemiological work is to be markedly extended.
6. Free drugs for the treatment of syphilis are to be dispensed to physicians for the treatment of free and part-pay patients.
7. There is to be an active educational program for both the medical and nonmedical public.
8. The responsibility of local municipalities and health departments for the program in their districts is to be maintained.

A venereal disease control program is here to stay. With energetic control measures, continuously applied, we can expect results.

THE LURE OF MEDICAL HISTORY†

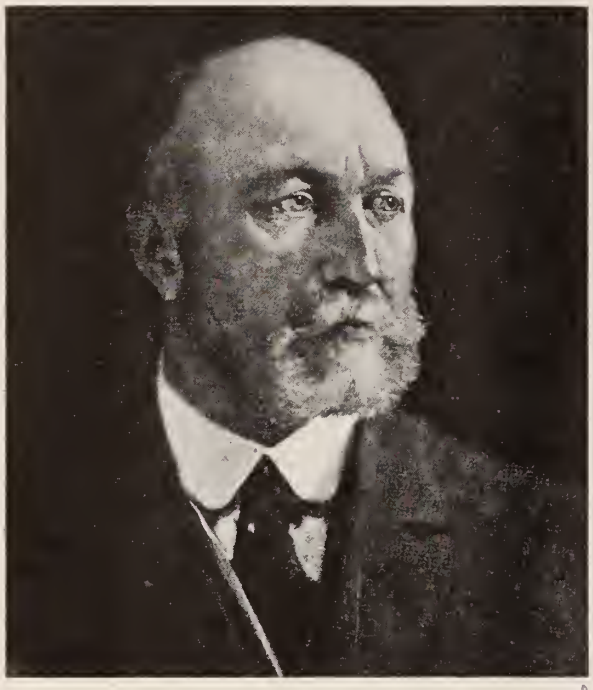
WILLIAM WATT KERR

III*

By Herbert C. Moffitt, M.D.
San Francisco

THERE are few cities of the world so beautifully situated, few so interesting from wealth of history and tradition as Edinburgh—"Auld Reekie," or the "Athens of the North." It was there, in Newington Parish, July 27, 1857, that William Watt Kerr was born. The first well-known Ker, either of Newbattle or Temple parish, a few miles south of Edinburgh, was given only one "r" in his name, but during the next generation the other "r" was added, undoubtedly to afford the proper Scottish burr that *we* knew in Ker-r. He was a branch of the family known as the Kers of Ferniehirst, with the Marquis of Lothian as chief. James Kerr the second settled in Liberton, on the outskirts of town, about 1730, married Janet Johnstone, and had twin boys and a daughter. John, one of the twins, married Janet Rait and they had nine children; he married again, Anne Bethune Taylor, and they had two sons—Alan, who died in infancy, and Andrew, the father of Doctor Kerr. Andrew Kerr, born May 13, 1814, in the parish of Liberton, was a noted architect and an antiquarian of renown. By competitive examinations he became a member of Her Majesty's Board of Public Works, in charge of all public buildings of Scotland. The postoffice of Edinburgh, the fountain in front of Holyrood Palace, are mentioned as his work. He was a Fellow of the Royal Antiquarian Society and, on retiring from the Board of Works at sixty, devoted himself to antiquarian architecture, restoring Baron's Hall at Dawn Castle for the Earl of Moray, and Rosslyn Chapel for the Fourth Earl of Rosslyn, and was actively in demand for similar restorations until his death at the age of seventy-three. He was a burgess of Edinburgh, a member of the Merchant Company, one of the Holyrood constables, well liked, well known as a good talker and raconteur—gifts which he transmitted to his sons. On December 18, 1840, he married Grace Watt, the daughter of James and Janet Watt, by whom he had nine children: John, Janet, James, Andrew, David, Annie, Euphemia, William, and Robert. By all accounts Janet MacAlpine, the doctor's grandmother, was a remarkable, forceful, intellectual matriarch, who knew what she wanted, and usually got it. The laird had proposed for her hand, and had strong backing from her parents. The parents argued, Janet objected, the laird agreed to wait, but a friendly minister was found; a sister snooping—as sisters will—discovered a marriage certificate in the names of James and Janet, and the fat was in the fire. The marriage was perfectly legal and could not be undone; but the culprits were brought before the Kirk Session, a strict and sour assemblage in those days. They were both children of elders of the Kirk, iniquity in such high places must be sternly dealt with, and a double fine was levied. But "Na, Na," said the bridegroom, "come awa, Jenny," and left the elders to rattle the few coins of a single fine.

Doctor Kerr's mother died on April 17, 1900, and is buried in Grange Cathedral with her husband. The memory of a daughter, Phemie, then seventy-one, is given of her in a letter written to James Kerr in September, 1926: "To describe her would be just impossible. She certainly, for more than four score years, had wrought for others, soothed the hurt of tears, rocked children's cradles, eased the fever's smart, dropped balm of love in many an aching heart, and father never would have been the man he was had she not been his life's companion."



UNDERGRADUATE DAYS

From the Royal High School William Watt Kerr entered the University of Edinburgh, was graduated in April, 1876, and passed his examinations in medicine in the spring of 1881, with the degrees A.M., M.B., C.M. We know that he played football at the University, but unfortunately little more. We know, however, that, in his time, interesting characters were to be seen strolling through the meadows near the Royal Infirmary, or climbing the hilly streets between the high-piled buildings of the town. John Stuart Blackie (whom we learn

† A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of California and Western Medicine. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

This is Paper III of the series. For other articles in the symposium, see California and Western Medicine, November, 1937, page 321; December, page 405.

WILLIAM WATT KERR, A.M., M.B., C.M.
1887–1889—Professor of Therapeutics
1889–1917—Clinical Professor of Medicine
University of California Medical School

of from "Christopher North"), the great teacher of Greek and the humanities, the prototype of the absent-minded professor, could be seen stalking about the city with his famous plaid over his shoulders. Passing the consulting rooms of a noted surgeon one day, he went in to have a sudden, pronounced limp investigated. It was found that he had been walking with one foot on the curb, the other in the gutter—hence the limp. Probably Sir William Turner, professor of anatomy and noted anthropologist, was dissecting his famous high-powered seventy-foot whale in the quadrangle about this time, which got him into decidedly bad odor with the townfolk. And Doctor Kerr may have attended the lectures of Alexander Crum Brown, professor of chemistry and a great character and scholar—a series on the "Alphabet" which lasted through the year and never got beyond the letter "C." During these years Joseph Bell was attracting crowds of students to his extramural lectures, wholly unaware that he was sitting for the portrait of the famous Sherlock Holmes, for Conan Doyle was then at the University, awaiting graduation as M. B. in 1881, and M. D. in 1885. Stirring events were shaping history at the Royal Infirmary during Doctor Kerr's time. Fifteen hundred students were attending lectures in medicine. In the surgical building, Lister, who returned to Edinburgh in 1869, was demonstrating his epochal discoveries, his meticulous care of antisepsis and of dressings, until he went to London in 1877. The new buildings of the University were completed in 1879, and "Farewell to the old Infirmary!" was sung with "Auld Lang Syne" by the resident staff in October of that year. Perhaps an inspiration for Doctor McNutt's poem of farewell to the old Toland school just twenty years later!

LURE OF CALIFORNIA

Doctor Kerr left Edinburgh in 1881 with inheritance of health, pride of family, *noblesse oblige,* and the highest principles; with traditions of a great University behind him, with the inspiring new medical teaching at his command. Fortunately for us, his uncles, William and Robert Watt, had been in California for years and had risen to be chief owners of the famous old Eureka mine in Grass Valley, and this affected the doctor's decision to come to the Pacific Coast. His brother, James Watt Kerr, eleven years older, a noted mining engineer, had arrived in 1867 to take charge of the mine, had moved to San Francisco in 1874, when the Colmans assumed control, and had started manufacturing mining machinery. Mr. Kerr was an interesting man whom many of us knew—impressive, forceful, uncompromising in his strict interpretation of business integrity. His strong stand in several big San Francisco strikes is well remembered. For several years Doctor Kerr made his home with his brother on Octavia Street, and it was there that he met Miss Rowena Boobar, whom he married in 1886. All know the happiness that each succeeding year brought in greater measure to both. Mrs. Kerr lived but to anticipate the doctor's needs and wishes; when she saw him anxious, tired, not in his usual harmony with the world, she would suggest a dinner with his old cronies—chief among them, Swan, Lewitt, Wadsworth, and von Hoffman. Straightway his face would beam and planning of the menu began. Mrs. Kerr died of heart disease on December 23, 1934.

EARLY DAYS IN SAN FRANCISCO

With the triumphs of Listerism fresh in mind, Doctor Kerr at first intended to do mainly surgery. He became associated, however, with Dr. James Simpson, a relative by marriage of his brother, and gradually took over both the office and outside medical practice. Doctor Simpson had prospered in various mining towns in California, and had moved to San Francisco in 1872, where he continued his success. He was professor of materia medica and therapeutics for four years at Toland from 1879 to 1883. Henry Harris has characterized him as "a rare, sound uplifter, devoid of killjoy, a sophisticated and recurring sampler of straight or mixed beverages." This association, and his growing reputation as an authority on diseases of the chest, determined once and for all Doctor Kerr's future bent, and he gave away his surgical instruments. But for many years he practiced obstetrics, which had been so ably taught in Edinburgh by Sir Alex Russell Simpson, of whom he often spoke. He always liked the specialty, was extremely good at it, and only gave it up when warnings of his circulatory limitations no longer could be ignored. He was a sworn foe of the abominable "formulas" so often forced down infants' throats, and was always seeking substantial if not highly moral wet nurses. Those of us who remember Jimmy, his driver for many years, who sat in the hall during office hours after the doctor moved from 522 and later 600 Sutter Street, will recall the arguments with Nellie, who ushered in

the patients, as to shunting of portly ladies into the private or the supply departments.

INTEREST IN ORGANIZED MEDICINE

Despite his youth, practice grew rapidly, and he was active in many other ways. As early as 1882 his name appears as a member of the State Medical Society in the published volume of transactions. During the next years he was a member and later chairman of the Board of Censors, a member of committees on public health, clinical medicine, microscopy, and in 1887 rendered a report as chairman of the Committee on the Practice of Medicine. It would be interesting, at some future date, to quote longer excerpts from this report, from his address as president of the State Society and from his various papers on the heart. In the report of 1887 he said: "Perhaps the most distinctive feature in medical thought at the present time is the tendency to adopt a local treatment instead of internal medication. What may be regarded as minor surgery is becoming more common among physicians, while under their advice new and graver operations are undertaken for which the skill of the specialist in this department is required. Indeed, so aggressive has surgery become that it is frequently impossible to decide to which department the cases belong, and it is absolutely necessary for the physician to understand the risks and responsibilities of each operation, since with him lies the responsibility of recommending it at an early stage or temporizing."

CHAIRS IN THE MEDICAL SCHOOL

Some time in 1885 and 1886 he is reported to have worked with Doctor James Blake on the pharmacology of cerium salts; and on June 12, 1886, the faculty of Cooper Medical College passed resolutions thanking him for a course of lectures on hygiene, which he had delivered during the winter semester of 1885. On December 27, 1886, he was appointed professor of therapeutics in the Medical School of the University of California, resigning January 8, 1889, to become professor of clinical medicine, a position he held until his death, April 26, 1917. Even while in charge of therapeutics he had been teaching medicine in the wards under Doctor Kane, whom he succeeded.

A BUSY LIFE

And now, until the earthquake and fire, followed tremendous years, though made up largely of horse-and-buggy days. He was increasingly in demand as a consultant, as well as a family physician. Visits before his eight o'clock lectures, fifteen to twenty more during the morning, still others after office hours, kept Jimmy and two teams circulating rapidly all over town. He was always particularly interested in diseases of the circulatory system, but covered the field of general medicine in his practice as in his lectures. He was a keen observer, a master of percussion, auscultation and palpation. Despite early contact with the model of Sherlock Holmes, he always warned against snap diagnoses. And yet, as Doctor von Adelung has recently written me, "Doctor Kerr possessed what is sometimes called the sixth sense in medicine, the diagnostic 'hunch,' which is not a hunch but wisdom acquired by long, close study and careful observation." He was much impressed with Jonathan Hutchinson's little book on "The Pedigree of Disease," which appeared in 1886. With him the proper order of procedure was careful examination, individualization, consideration of constitution, temperament and idiosyncrasies, and finally prescribing. As the conclusion of his report on medicine to the State Society in 1887, he wrote: "In the treatment of disease the physician should endeavor to have the normal and perverted physiological processes in each individual case as clearly before his mind as the surgeon has the arteries, veins, and nerves that he is to avoid in the performance of some operation." Again: "There is too much 'book' medicine at present, too great a tendency to regard the sick as something closely akin to a vessel containing certain noxious ingredients which are neutralized by the additions of certain antidotes; and too strong an inclination to look upon the patient as a machine out of repair, instead of a living being in whom vital and chemical changes are taking place that must more or less interfere with our remedies." In later years he used comparatively few drugs, but had faith in digitalis, arsenic iodids, bromids, and opium. It is interesting to glance through old files of Lengfeld's Pharmacy, kindly furnished by the managers of the Shumate stores, and to find his small, neatly written prescriptions, signed "Wm. Watt Kerr," calling for his old favorites, Murchisan's pills or codein with syrup of tolu. A lesson in prescribing promiscuously was taught him, he told Doctor Woolsey, by one of his early patients. He had been assiduous in attending a maiden lady, frequently changing medicines during six or eight months. Finally, he told her his services were no longer needed, as she had completely recovered. She spoke of the great value of the many remedies, and he felt duly complimented. She then raised the two pillows of her bed and underneath, marshalled in imposing rows, were the many bottles, all *unopened*. That one lesson was enough! He was a clinician of the Edinburgh school, broadening, advancing each year by reading, teaching and experience with all kinds of diseases, all types of men, yet always ready to make use of new methods, new instruments in diagnosis; always eager to test new remedies, to profit by surgical advances. He, as well as Doctor Hirschfelder, experimented with tuberculin at the County Hospital in 1891. The Widal reaction was tried in his wards soon after it was described in 1896. He encouraged Doctor Ryfkogel in his clinical laboratory work, and stood stalwartly behind him and the courageous Board of Health when attacked by governor, big business, and a group of subservient doctors during the plague scandal of 1900.

GEORGE WILLIAMS HOOPER FOUNDATION

From student days, Doctor Kerr was familiar with the publications of Gull and Ord on myxedema. He had no difficulty, therefore, in recognizing a typical picture of the disease in Mr. George Williams Hooper, who consulted him soon after

the appearance of Murray's report of four cases treated successfully by juice expressed from thyroid glands of sheep. Mr. Hooper changed marvelously for the better soon after starting treatment, and daily thereafter sent to the slaughterhouses for fresh sheep thyroids. Somewhat later Doctor Kerr took Mr. Hooper to Doctor Starr of Philadelphia, who concurred in the diagnosis and suggested a trial of desiccated thyroid, which had been introduced in tablet form by the Parke Davis Company in 1893, one year after publication of Murray's paper. It is interesting to note that Mr. Hooper took twenty grains daily for many months, later only five grains of the Burroughs Wellcome preparation, and that in his last years only one-fifth grain, as any larger dose promptly caused disagreeable symptoms. To Mr. Hooper's interest in scientific and experimental medicine, aroused by Doctor Kerr, kept active by Doctor Ebright, we owe the George Williams Hooper Foundation.

DOCTOR KERR'S PERSONALITY

In a recent address before the Edinburgh Royal Medical Society—the oldest association of medical students in Great Britain—Lord Horder used words that could well have been applied to Doctor Kerr: "For the doctor there can be no left or right; for him there is expert knowledge and a rooted adherence to truth and horse sense." Patients were drawn to Doctor Kerr by his stalwart presence and winning personality; they loved him for his gentleness and kindness, and had confidence in his knowledge, his stability, his voice, even the creaking of his shoes as he climbed the stairs to the sickroom. They knew instinctively that he was honest, straightforward, dependable. No doctor ever had more loyal followers.

HIS RÔLE IN THE MEDICAL SCHOOL OF THE UNIVERSITY

Who can speak adequately of his thirty years devoted to teaching in the University of California? His soul was in his work, his heart was given to his students. Turn back the pages of the old announcements to 1887: "Professor Kerr will direct the attention of the student to general medical diseases, exercise him in physical and differential diagnosis, and give him every opportunity of putting into practice the knowledge he has acquired from his didactic lectures." Moreover, there was to be "instruction in all these details which qualify the student to discharge his duty agreeably and efficiently in the sickroom." Lovely language, but certainly *not* that of Doctor Kerr. Whose *was* the mysterious voice that echoed through the old announcements? Three times a week, Tuesdays, Thursdays, Saturdays, the clock struck eight as he entered the amphitheater. The black skull cap was taken from his pocket, unfolded, and usually donned. Standing, walking about, in later years sitting in his chair, he spoke easily, simply, of the disease in question, or demonstrated its characteristic features in patients brought from his wards. There was no drama, there were no frills, but the students felt that what he said was *so*. He aimed to cover the whole field of medicine in the course of lectures to the third and fourth years. It is interesting to see from these lists of diseases considered during the year that syphilis, tuberculosis, exanthemata, and other infections were kept in integral part of the department of medicine—where they still belong. Typhoid, cerebrospinal fever, and thirty-one cases of malaria are recorded in one year at the hospital, and 3,641 visits to the old clinic on New Montgomery Street. Only one man of this 3,641—so different from now—could be called a pay patient, and he came because he swallowed a five-dollar gold piece. Thanks to our present beneficent government, this could not happen here.

THE OLD CITY AND COUNTY HOSPITAL OF SAN FRANCISCO

The old City and County Hospital was erected in 1873. It was a great old place, full of memories that did not all go up in the smoke of its destruction. The site was well chosen, and we can vouch for the salubrious, stimulating Mission climate, for in 1899 six guinea pigs were presented to Doctor Ebright, and by the time of transference to Ingleside, there were at least two thousand. After August, 1907, when a case of bubonic plague was found, no new cases were admitted, and on January 2, 1908, the 130 patients remaining were transferred to a building on the Alms House Tract. On March 10, 1908, a fire broke out in this old four-story wooden building—fortunately, about eight in the morning—and all inmates were saved. Patients were then housed in the Alms House Building No. 1, and on April 10, 1908, were moved to the stables of the Ingleside Race Track. In the summer of 1909 the first reinforced concrete building erected in the city was completed on the Alms House Tract; habitués of the track were transferred and remained there until May, 1915, when the magnificent new San Francisco Hospital was opened. Picture the old county wards!—thirty-two beds, covered with the faded checkered pink, only to be duplicated on old-time restaurant tables; *Nachtische,* commodes or storage vans of the old ladies crammed with old shoes, hair switches, and paper bags of goodies; the old women, *full* of complaints, which faded to whispers at Doctor Kerr's approach, for his heartiness never failed to win a smile from even the most obstreperous virago. Through these wards walked with him students and internes, whose later careers were shaped as much by his example as by his teaching. It was my good luck to be welcomed by him here in 1898, my misfortune, soon after, to have a so-called promotion transfer me to Parnassus Heights. Those of you fortunate enough to have been his internes will recall his kindness, his justness, his square-dealing with alcoholic and other peccadillos. Would that we had time to recount his stories, to tell of his clinical acumen and keen use of all his senses. Passing one day the open door of one of the rooms for contagious diseases he paused, sniffed, and asked what case was there. "A case on the P and S service, hemorrhagic measles," replied the interne. "Better tell them to quarantine for smallpox," said Doctor Kerr, and so the case proved to be. Then, as now, patients with undesirable infections, with

finances running low, were transferred to the county from other hospitals. Two well-spotted patients were sent over from St. Luke's as suspected typhus. Doctor Kerr pronounced them typhoid; the Widal reaction, done almost for the first time by Ryfkogel and Ebright, said likewise. Giannini, who had volunteered to take care of them, was firmly persuaded that they and he, *too,* had typhus; but the autopsy proved typhoid, and Giannini recovered.

HIS CONTRIBUTIONS TO MEDICAL LITERATURE

Though swamped with practice, meticulous in care of teaching and hospital service, Doctor Kerr found time for writing and medical society activities. A list of his papers was published by J. Homer Woolsey in CALIFORNIA AND WESTERN MEDICINE (Vol. 23, p. 607). Of the thirty-four articles, seventeen dealt with diseases of the circulatory system. These were always interesting to him, and soon after arriving in San Francisco he wrote a long paper on functions of the capillaries, and in January, 1889, he reported two cases of aneurysm treated by wiring and electrolysis in October and December, 1887. His papers on myocardial insufficiency, angina pectoris, angina sine dolore, on the value of arsenic, iodids, protiodid of mercury in chronic heart disease, on the danger of hot baths in arteriosclerosis, on the necessity of caution in giving nitrites in angina pectoris, are full of valuable observations and suggestions that are well worth reviewing today. He emphasized the value of hyperesthesia in distribution of the left intercostohumeral nerve as a precursor of angina pectoris, was in favor of abandoning the vague term "pseudo-angina," spoke often in aphorisms or maxims, such as "Football men take more risks on bones and neck, but sprinters and hurdlers more on heart." Early descriptions of eosinophilia in trichiniasis, of typhoid meningitis, and a timely lecture on plague, showed his interest in application of laboratory methods to clinical medicine.

MEDICAL SOCIETY ACTIVITIES

He was president of the San Francisco Medical Society (1893-1894); president of the Academy of Medicine; president of the State Medical Society in 1898-1899. Those knowing only the amenities of golf, teas, and ladies auxiliaries of our emasculated meetings, can scarcely understand the vigorous language, picture the strenuous doings of the doctors of the eighties or nineties. Old warriors can still hear the thunder of C. P. Buckley against oxytuberculin and the plague, the queer but vehement English of Charles G. Kuhlmann, "I will once more iterate and demonstrate that bacteriological investigations are of no value in elucidating the causes of disease." We still see the fiery MacMonagle, the suave Tait rising to compliment the speaker and to annihilate him by quotations from the French. Some of us thought the earth trembled on the morning of April 18, 1906; it was but the reverberation of forces that shook it during three days of a state medical meeting in April, 1898. Doctor Pedlar of Fresno, in welcoming the State Society, uttered most high-minded sentiments: "We, the great army of busy physicians, come together as a fraternal body, and it is our duty to foster a fraternal spirit." Next day Doctor Kerr was nominated for the presidency by W. L. Wills of Los Angeles, and Washington Ayer proposed the name of Doctor McNutt, who, it was rumored, had written touching letters to the country practitioners and rather packed the court. In seconding the nomination of Doctor Kerr, Doctor MacMonagle made use of certain expressions and evidently forgot to smile. He was encountered later on the floor and charged by Doctor Potter, who, advancing his topper like a shield with his left, wielded his umbrella like a saber with his right. It is not uninstructive to read an account of the election: "As the votes progressed, the excitement became intense, and not until the last vote was counted could the result be foreseen. When, however, the smoke cleared away and the chair announced the vote as Kerr 48, McNutt 47, pandemonium reigned supreme, and the chair announced the election of Doctor Kerr by one vote, thus overlooking members who were calling for a recount." In an editorial in the journal of the rival faction (Doctors McNutt, Potter, Winslow Anderson, and others) it is stated plainly that "Doctor Kerr was not present, and it is believed would not have countenanced the methods had he been there." "To understand Doctor MacMonagle's intense excitement we have only to say that twice he called Doctor Potter 'Doctor Plummer,' and to understand Doctor Potter's extreme forbearance we have only to say that he stood this without resentment." Ready fists but *toujours la politesse* in those days! Some of you may remember the rather dubious congratulations of Doctor McNutt to the Medical School on moving from Toland to the Parnassus site: "In its new quarters, undisturbed by the chirp of the cricket and the souffle of the pines, the student can study nature in all her naturalness, free from clinics and dispensaries."

OSLER'S "DOCTOR'S DISEASE"

There is a disease, insidiously, often silently, undermining in its early stages, that too often strikes down men of our profession in their prime. Osler has called it the doctor's disease. Recent statistics of H. L. Smith, from the Mayo Clinic, emphasize again that its incidence is four times greater in physicians than in laborers or farmers, twice greater than in bankers, ministers, or lawyers. It has recently taken a great friend and doctor from our ranks. Doctor Kerr was singularly free of minor ills, although he had heard "the lispings of the gout" and experienced an attack of renal colic. On October 3, 1904, he had been catapulted from his autocar to the pavement, with resultant injuries to head and left shoulder that incapacitated him for four months, but fortunately left no permanent damage. Then, about 1910, he would frequently have to pause in corridors or wards because of claudication of the left leg. Later came an annoying sense of cold about the precordium and, still later, typical angina on exertion. Attacks came with slighter cause and with increasing pain. They did not ruffle his calm equanimity. Cheerfully he

put his house in order, and Mrs. Kerr and he never faltered on their path of duty. He studied, with curious intentness, the varied manifestations of advancing vascular changes. He published, one of several similar papers, "Notes on Angina Pectoris" in the State Journal in 1915, and a remarkable account of experiments on himself in an article entitled "Danger of Hot Baths in Patients Suffering from Arteriosclerosis" in the State Journal of 1916. He was seen in January, 1916, with his physician three days after an attack of coronary thrombosis. Even then he could not be persuaded to give up the work, the teaching he loved so well. Outwardly there was little change; but the year went by with increasing effort, and in March of 1917 he gave his last lecture, which has been dramatically described by one of the men present. Students waiting in the corridor saw him walk slowly from his car. Seating himself in the amphitheater, he paused longer than the customary time, glanced over the rows before him, and said, slowly: "We shall speak today of angina pectoris. Not of the pathology, which is familiar to you all, nor of the slighter pains which grip the chest and spread to arms—right as well as left—but of sensations that can less well be put in words. There comes a moment when the heart seems all too small to overcome the great pressure gathering in the chest. A massive column of blood seems surging upward and to the left and can find no outlet in passages that feel too rigid. And, rising from the chest, a constricting force grasps the throat and squeezes upward to the angles of the jaw." Students who heard him have never forgotten the hour—they saw him then for the last time. Soon after two o'clock on the afternoon of April 26, 1917, his nephew, Andrew Kerr, was seated in his waiting room in the Galen Building. C. C. Moore, an old friend and patient of the doctor, had just entered the consulting room, when he rushed back crying, "Something has happened to the doctor!" Doctor Kerr had risen from the desk to greet him, but had sunk back silently into his chair. When several of us got there a few minutes later, he had been laid upon a couch, on his face no sign of suffering. Doctor Kerr was dead.

A GREAT TEACHER, A GREAT PHYSICIAN, A GREAT MAN

His portrait and photographs speak eloquently of the Doctor Kerr we knew. We see there strength, honesty, kindliness, dignity. No wonder he was honored, revered, and loved. To his students he was always "Daddy Kerr." Deeply religious, but without parade, he was a good citizen, a loyal friend, a lover of his native and his adopted lands. Grave and conscientious at his work, but full of the joy of living, he was a boy again on his fishing trips and vacations; a genial host, whose beaming face and hearty laugh drove care away. Few things could ruffle his even temper, but righteous indignation was always roused by shams and lies, and fanatical attacks on scientific medicine. His memory will live as a great teacher, a great physician, a great *man*.

CLINICAL NOTES AND CASE REPORTS

MULTIPLE CONGENITAL ABNORMALITIES*

By N. Berwyn Lawrence, M.D.
Colton
AND
E. Harold Shryock, M.D.
Loma Linda

WE present herewith a case of congenital malformation in which there were so many separate deformities, and some of the deformities were so extreme, that we feel the report may be worthy of publication.

REPORT OF CASE

The case was that of a fetus which had undergone about thirty-two to thirty-four weeks of development. It was delivered in the home on November 21, 1936, by Doctor Lawrence. The family consisted of a father and a mother, each aged 26, and two healthy children, aged, respectively, four and six. Both parents responded negatively to the Wassermann reaction, and there was no history of abortions or miscarriages, nor was there any history of congenital malformations among the known relatives, except that one child in the immediate family has a small cervical cyst.

Aside from the delivery being somewhat premature, the first observation of note at the time was that the presentation seemed to be that of the breech. Vaginal examination appeared to confirm the idea of a breech presentation, but indicated that there was no true gluteal cleft, thus making the operator suspicious of an imperforate anus. The usual amount of amniotic fluid was apparent at the delivery.

External Deformities.—At the completion of delivery the following externally apparent deformities became evident: imperforate anus, absence of left lower extremity below the knee joint, the left hand consisted of but two digits (the thumb and first finger), webbed left elbow (left forearm could not be extended), right talipes varus, absence of penis, and absence of the urethral orifice.

The child breathed a few times, tried to cry, and then spontaneously ceased to breathe.

X-Ray Studies.—Before performing an autopsy the accompanying photographs were taken and a complete x-ray study was made by Dr. Elizabeth J. Hiscox, roentgenologist at the Loma Linda Sanitarium. The x-ray studies indicated an absence of all the bones of the left leg (the patella was present and just beginning to ossify), absence of the left ulna, absence of those metacarpal bones and phalanges corresponding to the absent medial three digits of the left hand (the carpal bones, as yet, showed no ossification), a typical talipes varus on the right, and an incomplete development (approaching an absence) of the sacrum and coccyx.

Autopsy.—The autopsy was performed by Dr. Oran I. Cutler, Professor of Pathology at the College of Medical Evangelists. It revealed that the lungs had never been inflated, but that, due to a tracheo-esophageal fistula, the stomach had been filled with air at the time the child took a few breaths. Also, the right lung consisted of but a single lobe. There was a small accessory spleen, no gall bladder could be found, and the large bowel terminated abruptly at a point corresponding to the junction of the sigmoid and rectum. The testes had not completed their descent, one being found in an inguinal canal and the other within the pelvic cavity. Although the suprarenal glands were present, there was, grossly, an entire absence of both kidneys, both ureters, the bladder, and the urethra. There was observed a small duct extending between the umbilical aperture and the blind ending of the large bowel. This was interpreted

to be the urachus. The skull was not opened, but no deformities of the head were externally apparent.

Microscopic Findings.—A section taken from the wall of the urachus revealed, upon microscopic examination, some fragments of transitional epithelium. Sections were also taken from a small multicystic structure found just below the left suprarenal gland. These showed many small epithelial lined structures which, it was thought, might be rudimentary kidney tubules.

COMMENT

Perhaps the most striking anomaly present in this case was the absence of the urinary system. Not only would this seem to indicate that the kidneys of a fetus are not necessarily active during even the latter months of intra-uterine life, but it would seem to furnish conclusive evidence against

Fig. 4

Fig. 5

Fig. 4.—Various views of the bony abnormalities, as well as of entire fetus, viewed posteriorly.

Fig. 5.—Lateral view of infant showing ossification centers in proximal end left tibia, and complete absence of ulna in left forearm.

the old theory that the amniotic fluid is the product of the fetal kidneys; for, in this case, in spite of the absence of even a urethral orifice, there was a normal amount of amniotic fluid present.

The tracheo-esophageal fistula was evidently the immediate cause of death. Had it not been for this deformity, either the absence of the urinary system or the absence of the rectum with the associated imperforate anus would, of course, have produced death within a relatively few hours. The other deformities found would, presumably, have been consistent with life.

The only clew as to the possible cause of the many deformities exhibited in this case is the admission by the parents of the use of a chemical contraceptive prior to conception. Whether or not we are justified in assuming that, under such circumstances, injury to the germ cells may result in congenital deformities, is problematical.

SUMMARY

The case presented is that of a fetus of about thirty-two to thirty-four weeks of development, in which approximately eighteen single deformities were noted. Included in this list of deformities are the virtual absences of all of the essential parts of the urinary system.

IODODERMA DUE TO LIPIODOL*

By Saul S. Robinson, M.D.
Los Angeles

THE injection of iodized oil in the form of lipiodol has been employed since 1922 for bronchography and other diagnostic procedures.[1] In 1927, Belote[2] of the University of Michigan reported the first case of iododerma following a lipiodol injection. O'Donovan,[3] Carmichael[4] (two cases), Scadding[5] (two cases), and Goldstein[6] have since recorded six additional cases of iododerma following the injection of iodized oil. There have been no case reports from California. Two of the reported cases have been fatal and indicate the severe idiosyncrasy that a patient may show to lipiodol. A fatal issue may depend on the combination of a marked iodin idiosyncrasy and the large amount of iodized oil usually injected for diagnostic purposes (20 cubic centimeters). Because of the widespread use of lipiodol and the severity of the iododerma that may result from its administration, the following case report is considered of interest.

REPORT OF CASE

Mr. H. K., aged 60, consulted me on May 13, 1937, because of an eruption that had appeared on the previous day over the trunk, the neck, and the extremities. No subjective symptoms were associated with the skin lesions. The past history revealed that the patient had suffered from a cardiac and a bronchial disorder, and on April 26 he had been given an intratracheal injection of 20 cubic centimeters of lipiodol for bronchography. The patient had been in good health since the injection, but complained of a disagreeable taste, probably due to the coughing up of the iodized oil. The only medication taken internally had been theominal for cardiac pain.

The dermatologic examination revealed a discrete, erythematous, pinhead to pea-sized maculopapular eruption located on the chest, back, neck, upper extremities, and the thighs. No lesions were present on the mucous membranes of the mouth and the throat. No adenopathy was present. The Wassermann and Kahn reactions on the blood serum were negative. The urine showed a strongly positive test for the presence of iodin.

The dermatologic diagnosis was iododerma following an intratracheal injection of lipiodol. Enteric-coated sodium chlorid tablets in the doseage of 15½ grains three times daily were given, with rapid clearing of the eruption. The theominal was administered with no effect on the eruption.

COMMENT

The elimination of iodin from the body after an intratracheal lipiodol injection is effected mechanically and by absorption through the usual body channels. Mechanical elimination of the iodin occurs by coughing up and expectorating the iodized oil. Moeller and Von Magnus[7] found iodin present in the urine as early as six hours following a lipiodol injection. These investigators reported the peak of urinary iodin excretion to occur in twenty-four hours, with iodin absent after six days. Iglauer[8] also reported the absence of iodin in the urine after six days, with the presence of iodized oil in the lungs for many weeks after the injection. It is interesting to note, in view of the above findings, that my patient's urine contained iodin eighteen days after the lipiodol administration. This delayed iodin excretion may account for the delayed appearance of the iododerma in my case.

The infrequency of severe iodism and iododerma following lipiodol injection is probably due to the stable chemical combination of the iodin and the unsaturated fats in lipiodol. Lipiodol consists of a 40 per cent solution of mettaloid iodin in neutral poppy-seed oil. Cases of iododerma from iodized oil have been reported where the patients had received iodin previously in other forms such as potassium iodid without manifesting idiosyncrasies to the drug, but developing iododerma after a lipiodol injection. Inasmuch as severe iododermas may occur from lipiodol, it is unfortunate that there is no method of determining iodin idiosyncrasy in patients before the lipiodol administration.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

SURGERY AND SYPHILIS

I. SYPHILIS IN RELATION TO GENERAL SURGERY

Charles Eaton Phillips, M. D. (2007 Wilshire Boulevard, Los Angeles).—The incidence of syphilis can only be estimated, as there are no statistics available to show its extent. The American Social Hygiene Association estimate that 5 per cent of the population are syphilitic. Such an estimate, from that source, is probably essentially correct.

Many diseases, such as smallpox, yellow fever, plague, puerperal fever, malaria, tuberculosis, and others, destroy a greater percentage of those infected, yet their deadliness is recognized and feared, and their ravages have been stopped by scientific medicine. Our knowledge concerning syphilis, its cause, course, symptoms, and methods of relief and cure, are as comprehensive as our understanding of any of the other deadly diseases, and yet we have not checked its ravages to any extent.

Destructive Action of Syphilis.—It still stands in the front rank of diseases destroying the race. There are reasons for this condition. First, let us list the difficulties of detection. A person may be suffering from syphilis in a contagious form, and still not show any characteristic symptoms which would warn those who might come in contact with him. Syphilis may be transferred before the symptoms of the disease become manifested. It may be contracted, and the person may not be aware of the infection until long afterward, when the disease is firmly established and a cure impossible.

The second reason for the spread of syphilis is that a little treatment will frequently clear up the early symptoms, and the patient goes on (ignorantly or carelessly) spreading infection. Many times the syphilitic patient receives treatment before a definite diagnosis is made. Neither the doctor nor the patient knows what the patient has, and as soon as the symptoms are relieved the treatment is stopped and the patient eventually dies of syphilis.

The fallacy that the infection can be stopped by an early cauterization of the initial sore is responsible for many cases which could be cured by adequate treatment in the early stage of the disease. It has been shown, since the discovery of the treponema, that the infection becomes widely diffused in the body almost from the first, and any kind of local treatment is entirely unavailing in an attempt to stop the disease before it becomes systemic.

Many initial sores are overlooked or, if seen, are not recognized. The difference between the number of those known syphilitic and the number who show the presence of the infection by its late manifestations, illustrate the dangers of overlooking syphilitic infection.

In 1924, Newsholme estimated that the annual death rate from known syphilis was one hundred and eighteen per million, or a total of about four thousand in England and Wales.

Osler (1915) estimated, in the same geographic limits, that the effects of syphilitic infection, neurologic, and cardiovascular were responsible for sixty thousand deaths, or fifteen times as many as were recognized as syphilitics. When we add to this number the sterilities, abortions, miscarriages and, worse than all, the mentally and physically unfit due to syphilitic infections, then we can see the appalling destruction that is due to syphilitic infection, and how it occupies a position as the most destructive disease affecting the human race.

In the Johns Hopkins Hospital Medical Service, where the Wassermann test is obligatory on every patient admitted, syphilis appears in 20 to 25 per cent of all colored patients, and from 7 to 10 per cent of the whites. One would expect the incidence of the disease to be considerably higher on the medical service than on the surgical side; yet the number of unsuspected cases that appear shows the necessity of continual vigilance in every department of medicine and surgery.

According to Albert Keidel, life insurance data show that among insured syphilitics there is a mortality of 168, compared with a rate of 100 covering all classes of insured persons, including the syphilitics. The same author states that 25 per cent of patients with recognized but untreated syphilis of more than two years' duration will have central nervous system involvement, and that from 40 to 80 per cent of such cases will have cardiovascular damage sufficient to lower their reserve.

Surgery in syphilitics is attended with an element of uncertainty. Active, untreated syphilis contraindicates all except absolutely emergency surgery. The syphilitic with infection under control offers no particular problem to the surgeon, and but slight increase in risk. Patients with latent untreated syphilis show a rate of danger distinctly higher than that in uninfected cases.

Danger of Syphilis in Surgery.—Syphilis offers a threefold danger in surgery:

First, it leads to errors in diagnosis. Nuzum, in a survey of one thousand operations in known syphilitic patients in the Cook County Hospital, found that ninety-seven useless and unnecessary operations had been performed on eighty-seven patients. Gastric ulcer, gall-bladder disease, appendicitis and salpingitis headed the list (Dean Lewis Surgery). When so many errors are made by competent surgeons in those known to be syphilitics, we can only surmise the mistakes of the less

skillful where syphilis is unknown and probably unsuspected.

On the other hand, the presence of a syphilitic infection is no assurance that the patient may not be suffering from other diseases at the same time. Many a case of known syphilis has suffered from disease of the gall bladder, appendix, salpingitis or other acute surgical diseases, and on account of the known infection operation has been delayed too long.

Secondly, there is an increase of the immediate mortality rate attending surgery. This can only be estimated by the lowered resistance of infected patients, and the less expectancy of life as shown by the life insurance statistics.

Thirdly, syphilis makes for an interference with the healing of wounds in a certain percentage of surgical cases which have been insufficiently treated. To illustrate: A young lady of twenty-five years was operated for the relief of a chronic pelvic inflammatory disease. There was no history of syphilis. There was a history of taking "shots" for anemia. The Wassermann was negative. Following the surgery, there was an uncomplicated recovery until the tenth day. The stitches had been removed and healing had seemed satisfactory when the edges of the incision began to necrose. A thin line of dry gangrene appeared along the edges of the wound. The Wassermann was repeated and found to be positive. Antisyphilitic medication caused prompt healing.

We can see the necessity of requiring a routine Wassermann in all cases admitted to hospitals. The negative history and the routine physical examination are not sufficient assurance that the patient is not infected with syphilis. A disease causing more trouble than any other is worthy of the utmost care in its treatment and cure. While the serologic tests do not always show the presence of existing syphilis, their routine use would do much to eradicate the disease.

Social Phases.—The stigma that attends infection with syphilis is one of the chief reasons for hiding its presence. Few, who find they are infected, are in a position to carry on treatment for a sufficient time to insure even a relative cure without sharing their secret with someone else. If, for no other reason, the expense of the treatment and the necessary precautions that must be taken are sufficient to betray their secret. Rather than divulge their secret, they are tempted to stop treatment when their symptoms are relieved and before a cure could be hoped for.

The injustice of the present system is apparent when we consider the way different crimes against society are punished. The careless individual throws a stone into a crowd and accidentally puts out an eye or scars a face. The offender is fined an amount commensurate with his ability to pay. He may be incarcerated for his act. The same careless individual infects with syphilis. There is no redress, although the patient's entire life may be ruined, as well as that of any offspring.

Possibly a young girl is betrayed and bears a child. The father of the child is held responsible for her condition. He is required to recompense her by marriage and support, or may pay money to support her and her child, as far as he is able.

In the event that he infects her with syphilis, he places a lifelong stigma on her, and yet is not held accountable for his act. The infection not only ruins her life, but also that of any offspring she may have subsequently.

In Conclusion.—Syphilis increases the hazard of operations and jeopardizes the result of surgery. Active syphilis should contraindicate all except emergency operations. The shock of surgery may activate latent syphilis.

A single negative serologic test is no assurance that the patient is free from syphilis. A negative history is of little importance regarding syphilitic infection. Family traditions, social position, religious affiliations, or absence of a history of specific infection cannot be accepted proof of freedom from the infection.

The cure of syphilis is problematical. When the case is seen early and treatment is adequately administered for a year and following, there should be check-up examinations every three months without any treatment. If these tests remain negative for the year, and the spinal fluid Wassermann, cell count, globulin, titrated Wassermann and colloidal are negative, the case may be considered clinically cured. There is no assurance that the cure will be permanent, and Wassermann tests should be taken at intervals for at least ten years. Spinal fluid tests should be repeated on the first untoward symptoms as long as the patient lives.

The prevention and final eradication of syphilis is possible only if the transmittal of syphilis is recognized as a crime and punishable by law.

A negative Wassermann test before marriage, while it is a step in the right direction, is not sufficient to control the disease. Syphilis is spread by many who are not interested in marriage.

Syphilitic infection, even if not transmitted, must be recognized as a misdemeanor and quarantinable unless adequate treatment is being taken. Treatment must be made available to all infected cases.

* * *

II. SYPHILIS IN RELATION TO INDUSTRIAL MEDICINE

Harry E. Alderson, M.D. (490 Post Street, San Francisco).—Industrial dermatoses occur in all trades and occupations, but it is mostly in certain vulnerable individuals that they are seen. Advancing years (past forty), congenitally thin or susceptible skin (allergy), and various underlying constitutional diseases are important factors. Under the last heading, syphilis may be listed as a fairly common cause. Syphilis at all stages not only tends to make the worker less careful, but on account of the tendency that even the latent syphilitic's skin shows to develop syphilomata at the site of traumatism, it often has to be con-

sidered. Also syphilis may at times retard the healing of wounds. So this disease renders its victims poor industrial risks.

Two cases in point were reported by me in 1931.[1]

Case 1.—Mr. C. C. (No. 25948), a Mexican carpenter, thirty-nine years old, presented a typical, non-ulcerating gumma, extending across the left upper orbital margin. There was a similar smaller lesion at the inner end of the right eyebrow, which had been present for several months. The former lesion appeared shortly after the patient was injured in that spot by a piece of lumber on which he was working. An abrasion resulted and it never healed, developing finally into a typical syphiloma. There was no history of syphilis, and the only other evidence found was a strongly positive blood Wassermann. Under neoarsphenamin and bismuth the lesions disappeared.

Case 2.—Mr. P. C. (No. 25190), an Italian laborer, thirty years old, presented a typical, non-ulcerating syphiloma at the right inner canthus. His blood Wassermann was strongly positive. It was impossible to obtain a history or other evidence of syphilis. About two months previously, while cutting wood with a "rip saw" a splinter of wood struck the side of his nose near his eye. The patient pulled out the splinter, and there was some bleeding. The wound never healed, and the syphiloma gradually developed. Under neoarsphenamin and bismuth injections it subsided rapidly.

In each of these two cases responsibility was accepted by the insurance carriers, and the necessary treatment to eradicate the lesions only was authorized.

The following case record, taken from the United States Public Health Reports of 1916, and the quoted court decision, establishes the status of these cases:[2]

A workman was injured by an accident in a sawmill at Traverse City, Michigan. Under the Workmen's Compensation Law, payments were made for a period of nineteen weeks, when the employer refused to make further payments, upon the ground that the employee's continued disability was due to syphilis, which retarded the healing of the wound.

The Michigan Supreme Court, however, decided that payments must be continued. Mr. Justice Person, in the opinion, said: "The consequences of the injury extend through the entire period, and so long as the incapacity of the employee for work results from the injury, it comes within the statute, even when prolonged by preëxisting disease."

Numerous decisions have placed on the insurance carrier the responsibility for medical care of syphilitics who have developed syphilomata as a result of vocational trauma or irritation. (See Klauder[3] and Harry Foerster.[4] Foerster[4] comments as follows:

"Compensation is not dependent on any implied assumption of perfect health, and does not exclude the weak or physically unfortunate, or those with latent and unknown tendencies to disease. The employment of a man is in itself an assumption that he is physically and mentally fit for the work."

Klauder[3] cites numerous examples where traumata of various kinds have determined the appearance of syphilomata at the site of injury. There is to be remembered also the often-quoted example of the occurrence of gummata on the foreheads of Mohammedans, who in their religious ceremonies frequently strike their heads on the marble floor.

With syphilis so prevalent, many of the cases having had inadequate treatment, it is rather discomforting to realize that in positions of responsibility there may exist cases of latent and of neurosyphilis. Stokes[5] reported, in over one thousand cases, eight times as many syphilitics among railroad men as among farmers! His article, which discusses also cerebrospinal complications, is of very great interest. Various other writers have stressed the great prevalence of syphilis among railroad workers, and such workers are frequently exposed to trauma.

Whether or not syphilis is acquired innocently or through carelessness, any occupational dermatoses that may be aggravated by the disease has to be taken care of by the insurance carrier. It would be wise, and perhaps would be the means of lessening disability and saving expense, if every patient with occupational troubles had a Wassermann test done at once.

* * *

III. SYPHILIS IN RELATION TO EYE INJURIES

Hans Barkan, M.D. (Stanford University Medical School, San Francisco).—It is not an unusual event to find the eye specialist treating an eye inflamed and injured without realizing that the manifestations of the injury may not be due to the direct effects of the trauma alone, but are complicated by the fact that they are partially manifestations of syphilitic processes aroused to activity by the trauma. When one considers the number of dormant syphilitics in the community, one is rather surprised that not more syphilitic post-traumatic manifestations are seen than is the case. To illustrate the point: Only very rarely, if ever, does the eye of a syphilitic, when operated upon for glaucoma or cataract, show any other than a normal course of healing. When, however, the trauma is a blunt one, such as a blow from a piece of wood, or a lead shot striking the cornea, or an eye hit by a piece of swinging rope, just to mention three personal cases, it must be borne in mind that the injury may arouse specific manifestations in an eye so predisposed.

1 Alderson, Harry E.: Syphilis in Relation to Occupational Injuries, Calif. and West. Med., Vol. 35, No. 6 (Dec.), 1931.

2 United States Public Health Reports, Vol. 31, No. 39 (Sept.), 1916.

3 Klauder, Joseph V.: Syphilis and Trauma, J. A. M. A., 78:1029-1037 (April 8), 1922.

4 Foerster, Harry R.: Industrial Dermatoses, Arch. Dermat. and Syph., 17:585-601 (May), 1928.

5 Stokes, J. H., and Brehmer, H. E.: Syphilis in Railroad Employees," J. Indust. Hyg., 1:419 (Jan.), 1920.

The most frequent of these is interstitial keratitis. Of these, I have seen four cases, published in the *Transactions of the American Ophthalmological Society* in 1926. The patients were all congenital luetics in their thirties and forties, at an age when interstitial keratitis as a congenital manifestation does not occur. In the injured eye in each case there developed, within a week after the injury, a typical keratitis, and in each case the second eye followed after several weeks or months, just as spontaneous cases in children do.

Iritis not infrequently follows a very trivial external injury, and is usually characterized by a severity out of all proportion to the external blow on the lids or eyeball. In one case I saw it develop as a typical iritis papulosa.

Blows of minor severity on or about the eye can be followed by periostitis of the supra and intraorbital margins as luetic manifestations. I have seen only one instance of this. Igersheimer, in *Syphilis und Auge,* states that luetic retinitis, choroiditis, and neuritis may follow blunt trauma in the luetic, but it seems to me that these sequelae, while they may occur, must be very rare and isolated cases.

The main interest, for practical purposes in the coincidence of trauma and syphilis in the eye, consists in the fact that a number of patients claim compensation disability, and we are occasionally asked to act as referee in such cases. The position I took in regard to this in several instances is as follows: First, the case must be seen on the day or not later than two or three days after the injury, so that the primary effect of the injury is still evident, and examination of the cornea and iris discloses that the process is not one distinctly antedating the injury. Second, the injury must be sufficient, and we must take our stand firmly against such injuries claimed as dust in the eye, exposure to wind or draft, cocain or atropin in the eye, conjunctivitis, etc. In review of the case which must be accepted, the trauma has always been a forcible striking of the corneal tissue, even though by a small object involving the breaking of the continuity of the tissue, or a blow of sufficient severity to cause deep hyperemia and disturbance of the lymphatic circulation of the eye. Third, the luetic effects must appear in a week or two after the injury, and fourth, the process must be typical, so that no doubt of the diagnosis can arise.

If we assume that the relationship of trauma to interstitial keratitis is only accidental in time, there is no such problem to be considered. We simply deny that interstitial keratitis is the result of any claimed trauma. If we believe that there are enough authentic cases, ruling out all cases of trifling injuries, conjunctival inflammations, nonirritating chemical or gaseous contact with the cornea, such as soap, atropin, etc.; and ruling out, also, many reported cases which were probably not interstitial keratitis at all—if, doing all this, we are still convinced that there are enough legitimate cases to establish beyond question the fact that trauma is of etiologic moment, we must maintain in such a case that the particular trauma can cause the luetic eye manifestation, and that, consequently, all the time of the disease is compensable, and the permanent loss of vision, to be estimated one year after the last inflammatory symptoms have disappeared, to be compensated.

Coutard's Method of Treatment of Cancer.—Since the results of Coutard therapy in the treatment of cancer of the larynx, pharynx, and hypopharynx have been so far superior to any present or previous method, Chamberlain and Young believe that no other procedure should be considered when roentgen treatment for the disease at these sites is indicated. The same statement holds for cancer in certain other organs, for example, the cervix, breast, bladder, esophagus, bronchus, and rectum, although it is often necessary to modify the dosage, depending on the size and location of the tumor and the condition of the patient. In those lesions which respond to Coutard therapy better than to "massive doses," the advantage of the protracted fractional dose method must rest on the existence of a more rapid "recovery rate" in the skin than in the tumor. There are tumors requiring massive doses just as surely as there are tumors that require the method of Coutard. Certain small superficial growths are completely destroyed by a single large dose of from 3,000 to 5,000 roentgens with complete assurance that the resultant ulcer, of small size, will heal completely; for example, a small or moderate-sized, isolated nodule of recurrent mammary cancer in an accessible or superficial location. A plan of monthly doses of from 300 to 800 roentgens (usually in a three- or four-day series) is considered by the authors whenever they are faced with (1) a highly roentgen resistant tumor and a microscopic structure that indicates a high degree of tissue differentiation (fibrosarcoma, neurofibroma, metastasizing thyroid adenoma) or (2) when the element of vascularity is an important factor (hemangioma, certain telangiectatic tumors of the spinal canal, some highly vascular but relatively radiation-resistant sarcomas of the bone). While the literature appears not to contain any analytic references to this type of technique, it is obvious that Newcomet, Ewing, Ginsburg, and others, have consciously or subconsciously adopted some such method.—*Radiology.*

The Art of Thinking.—Whoever lacks a ruling interest will fail to make the most of his mind; for without such training and experience as the long-continued pursuit of a subject gives, the intellect does not develop its power. Nor will the man of too many interests grow to his full mental stature. Mental growth in mature life, as shown by Spinoza and other examples, is fostered by nothing so much as an absorbing aim.

He who has a liking for a science or an art, for a branch of literature or period of philosophy, for the life of a great man, the history of a people, or other line of inquiry, is already on vantage ground. He is in a position to gain both insight and outlook. A point here and a point there will be located by the aid of which he may not only survey his own field, but also orient himself in wider provinces of knowledge. Thus he may hope to find some of the fundamentals of truth and life.

Through coping with problems, through investigation, reflection, and discussion, he will learn how to think. Meanwhile he will have a joy in books unknown to the haphazard reader; he will see more in life and the world than meets the casual eye. His days will be remote from the tragic need of killing time, for his leisure will be full of contentment, often of happiness and zeal.—Leon J. Richardson.

Adult education is in one sense a youth movement. Consider the countries involved. They are mainly the ones where English, the Scandinavian languages, German, and French are spoken. This fact is significant. In science, literature, and other fields of sound thinking, the peoples using these languages take high rank. They are progressive, giving much attention to the problems involved in bettering human life.

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section on pages 2, 4 and 6.

ASSOCIATION ACTIVITIES

COUNCIL MEETING

The Council of the California Medical Association will convene in regular session in Los Angeles on Saturday, January 15, 1938, at 9:30 a. m. The meeting will be held in the Lounge of the Los Angeles County Medical Association headquarters building.

Any county society, committee, or member having any proper matter requiring consideration by the Council is requested to transmit their question to the State Secretary.

ANNUAL DUES

January, marking the beginning of a new year, is the month during which members should pay their annual county and state dues for the current year.

The State Association dues for 1938 were reduced from $15 to $10 by the House of Delegates at the Del Monte annual session, and are payable this month to your county secretary, who will remit to the State Association offices. In due course you will receive your state membership certificate.

It is suggested that you remit your county and state dues to your county secretary today. Relieve him of the extra labor of having to assume the rôle of collector. *Send him your check today.*

AMERICAN MEDICAL ASSOCIATION SECRETARIES AND EDITORS' ANNUAL CONFERENCE

The Association's editor and secretary attended this conference at the American Medical Association headquarters in Chicago on November 19 and 20. The following constituted the formal program, and was productive in transmitting much helpful information as to activities of state organizations.

ANNUAL CONFERENCE OF SECRETARIES OF CONSTITUENT STATE MEDICAL ASSOCIATIONS, 1937

American Medical Association Building
535 North Dearborn Street, Chicago

PROGRAM

Friday, November 19, 10 a. m.

Call to Order. Arthur W. Booth, Chairman, Board of Trustees of American Medical Association.

Address. J. H. J. Upham, President, American Medical Association.

Student Health Services: A Challenge to Medical Societies. J. D. Laux, Bureau of Medical Economics of American Medical Association.

Extension (Postgraduate) Courses of State Medical Associations. Walter F. Donaldson, Pittsburgh; Creighton Barker, New Haven, Connecticut; T. W. M. Long, Roanoke Rapids, North Carolina; Holman Taylor, Fort Worth, Texas.

The Uses and Benefits of Exhibits Under Auspices of State Medical Associations. Eben J. Carey, Milwaukee.

12:30 p. m. Luncheon.

Friday, November 19, 2 p. m.

Address. Irvin Abell, President-Elect, American Medical Association.

The State Association and the Social Security Act:
New Jersey's Coöperative Program for Maternal and Child Health. LeRoy A. Wilkes, Trenton, New Jersey.
Coöperative Program of the Illinois State Medical Society. Harold M. Camp, Monmouth, Illinois.

The State Association's Part in a Pneumonia Control Program. Peter Irving, New York.

Friday, November 19, 6:30 p. m.

Palmer House

Dinner Meeting of Editors of State Medical Journals. E. M. Shanklin, Hammond, Indiana, Presiding.

Better Papers for State Medical Journals. J. H. Dempster, Detroit.

Round-Table Discussion:
Publication Costs.
Typographical Arrangement.
Cross References.

Saturday, November 20, 9:30 a. m.

Two Important Legal Problems: Malpractice Claims; Taxation Under Federal Revenue Acts and Social Security Act. W. C. Woodward, Director, Bureau of Legal Medicine and Legislation of American Medical Association.

Topics for General Discussion:
Secretary's Bulletins for Officers or Members.
By-Laws Pertaining to Membership and Disciplinary Measures.
Rural Rehabilitation Plans of Federal Government.
Independent Societies.
Automobile Accidents.

Editorial comment and letters published in the December issue transmit to each reader the serious question that concerned the conference. Every member should carefully read the editorial and the communications and devote time in consideration of their portent.

Under the democratic plan of our medical organization, channels and methods have been created for the presentation and consideration of any principles, policies or plans that any member, individual or groups of members or individuals may feel should receive attention and action.

That which organized medicine has accomplished has been attained through these channels by constituted representatives. The channel is an open one, and is continuously operative.

Independent or coterie action is disorganized action and as such is unwise, and deserves no support.

Need more be said than to remind all members that our organizational strength and unity is the more potent force in conserving our individual and collective future. Let that thought remain uppermost when independent proposals are presented to medical men.

*All articles listed under the caption, "This Month's Topics," have been written and sent to the Editor by the Association Secretary, Dr. Frederick C. Warnshuis.

PANEL JOBS AND CUT-RATE FEES

Members are approached from time to time by representatives of corporations, insurance companies, lay groups and organizations seeking to secure medical services at bargain rates, greatly reduced from the prevailing schedule.

Within the past month county societies and individual doctors have been approached by an Automobile Insurance Company representative seeking to secure medical services, when needed, for its policyholders. The representation is made that if the doctor will render medical and surgical care to these policyholders for fees 25 per cent below the present compensation fee schedule, his name will be placed on the panel of the insurance company doctors and this business will be sent to him.

The old bait! One for which the unthinking doctor will fall, and be the sucker while the company pockets increased profits at the doctor's expense.

Compensation fee schedules are now below the regular fee schedules. Why should you accept a still further reduction under the sales urge of the company that paints pictures of increased volume of practice and income? Why should a company seek reduced fees, prey upon the doctor, lower his just income and seek these exceptions and favors? Simply to lower their liability expenses, lessen their costs and increase company earnings and dividends at the expense of the doctor.

In all such quests and approaches the member should refer the entire matter to the officers of his county medical society and abide by the policy of his society. There must be no cut-rate fees. Do not fall for the gush of these representatives who hold out the bait of increased volume of exclusive business, special qualifications, etc.

Before signing up, consult your county secretary. Do not undercut your fellow practitioners.

READ YOUR LIABILITY POLICIES

Again we have seen this month three policies issued to members and which these members thought gave them adequate insurance protection. They did not! Exceptions and noncoverage were for "*nonemergency* operations," protection defense only for suits arising "*within* the year the policy was in force" and not for suits brought from one to two years later or in the instance of minors who can start a suit within two years after they attain their majority. A hidden clause wherein the company can settle without consulting the holder of the policy.

Hence the warning is issued anew! Read your policy and learn if you have adequate protection.

POSTGRADUATE CONFERENCES

On December 2, the first postgraduate conference under the new five-year program of the Association was held in Eureka. Thirty of the thirty-four members of the Humboldt County Medical Society attended. Three of the members drove 176 miles to participate in this conference.

Dr. Stacey Mettier of the medical department of the University of California presented the subject of arthritis. Dr. H. Glenn Bell of the same school covered the subject of acute involvement of the gall-bladder.

Councilor Henry Rogers and the State Secretary presented the outline of State Association policies and activities.

* * *

On December 9, President Morrow, Councilor Rogers, and the State Secretary were speakers at a well-attended meeting of the Marin County Society. Doctor Morrow presented a lantern-slide clinic on syphilis and discussed State activities in venereal disease control and treatment. Councilor Rogers and the Secretary discussed Association activities.

It was an excellent meeting, but in an unusual heavy rainstorm the President and the Secretary made a wrong turn and got off the road and became mired in a ditch and almost two-mile walk in a drenching rain to a telephone brought the County Secretary with a chain. However, power was lacking to pull the car back on the road, so it was abandoned temporarily and journey resumed in the County Secretary's car, and here another but—he, too, got lost in the hills in his own bailiwick. Aimless driving eventually landed us in his own city where, oriented anew, he delivered us at the meeting place some two hours late and two state officers thoroughly soaked—with water from shoulders to feet, but even this did not dampen a very interesting and worth while evening meeting of the Marin County Medical Society.

COUNCIL ON INDUSTRIAL MEDICINE AND SURGERY

A resolution passed by the American Medical Association House of Delegates last June directed the Board of Trustees to appoint a Council on Industrial Medicine and Surgery. The following appointments have just been announced: Stanley J. Seeger, Milwaukee, Chairman, Harvey Bartle, Philadelphia; Warren F. Draper, Washington, D. C.; Leroy U. Gardner, Saranac Lake, New York; Morton R. Gibbons, San Francisco; Henry H. Kessler, Newark, New Jersey; A. D. Lazenby, Baltimore; Earl D. Osborne, Buffalo; and C. W. Roberts, Atlanta, Georgia. The Council held its first organizational meeting in Chicago on December 10.

Our congratulations are extended to Dr. Morton R. Gibbons, Sr., on his appointment as a member of this Council. Doctor Gibbons' ability and long years of experience will make him a most valuable member and give assurance that this newly created Council will accomplish needed regulations, policies, and results. California's profession is gratified by Doctor Gibbons' appointment because it is felt that these peculiar problems in California will receive careful consideration.

PERMANENT ENDOWMENT FUND

Contributions to date—$200 from two members! A rather disheartening response to the several editorials and items in previous issues. Surely, there are 998 members who can subscribe $100 or more to establish this permanent endowment fund, whose principal will remain intact in perpetuity. Will *you* be one of them?

The income earnings of this fund will be appropriated to defray the expanding activities of this Association, particularly our five-year postgraduate program opportunities and the program of public education.

Please pause and consider what amount you can subscribe to this fund and remit it today. One hundred dollars—or one thousand, and maybe more. The Council urges that you aid in establishing this fund.

MEMBERSHIP

Because occasionally misunderstanding and confusion arises regarding the status of members in their county and state medical organizations, the Constitution and By-Laws governing membership are reprinted:

Article IV.—Membership. (a) Active Members. Qualifications.—Active members shall comprise all active members of all the component county societies. No person shall be eligible for election to active membership in a component county society unless he shall hold the degree of doctor of medicine issued to him by an institution of learning accredited at the time of conferring such degree by the American Medical Association or the Association of American Medical Colleges. He must also hold an unrevoked license to practice medicine and surgery in the State of California; provided, however, that, subject to the minimum qualifications prescribed by this Constitution and the By-Laws, each component county society shall be the exclusive judge of the qualifications of the members thereof.

Membership in the American Medical Association does not, *ipso facto,* mean that one is a Fellow of the American Medical Association. To be a Fellow of the American Medical Association, one must make special application and pay an additional $7 to the American Medical Association for fellowship annual dues. The perquisites of fellowship are: (1) Receiving the *Journal of the American Medical Association.* (2) Admission to all the exhibits, general and section sessions of the annual meeting. (3) Right to participate in the scientific meeting programs. (4) Eligibility to appointment or election to offices, councils, committees and bureaus, and membership in the House of Delegates.

Many members are under the impression that they are Fellows because they subscribe to the *Journal of the American Medical Association* and remit $7 annually. It is imperative that you apply for fellowship. If you are a

Fellow you will receive a Fellow's pocket card, necessary to register at an annual session and gain admission to *all* annual functions.

Search your wallet or files and ascertain if you have a fellowship card. If not in your possession, then it is recommended that you file the proper application—obtainable from your county secretary or your state secretary.

EXECUTIVE COMMITTEE MINUTES: DIGEST

The Executive Committee of the Council met in San Francisco on December 11.

1. Malpractice liability insurance questions were referred to the Committee on Malpractice, to report on January 15, 1938.

2. Secretary authorized to reissue charters to county societies whose original charters were lost.

3. A Mexican vacation tour was sponsored.

4. Membership Roster of 1937 was ordered published as a supplement to the February journal.

5. Hospitalization plans of Southern California Associated Hospitals was referred to Committee on Public Relations for report on January 15, 1938.

6. Qualifying Certificate Committee requested to submit detailed report on January 15, 1938.

7. Routine matters discussed and acted upon.

8. January 15, 1938, was fixed as date for the next regular Council meeting in Los Angeles.

F. C. Warnshuis, *Secretary.*

PASSING COMMENT

It costs the government $900,000 per year for treatment of men in the ranks of the CCC for venereal infections.

* * *

The "Elixir Sulfanilamide Tragedy" has caused some stir in congressional circles. It is hoped that this tragedy and loss of seventy-three lives will induce Congress to enact needed legislation to control the manufacture and sale of potent drugs and remedies. Write to your United States senators and congressmen urging their support of this needed legislation.

Drug manufacturers are applying to the Council on Pharmacy and Chemistry for approval of their preparations.

Do not use, administer or prescribe nonapproved drugs or compounds. Rely upon this safeguard for your patient and yourself.

* * *

You will please your county secretary if you will send your check today for your 1938 county and state dues. Relieve him of the rôle of a dunning collector—he will have more time to devote to other official duties.

* * *

May 9 to 12 is the date, Hotel Huntington in Pasadena is the place for our 1938 annual session. Write today to the manager of the Hotel Huntington for your room reservations. A truly worth while program is about completed. Four very noted guest speakers have accepted invitations to address that session. Commence now to plan to attend.

* * *

Certificates of membership are standard in size. Purchase a frame and display your certificate in your reception or consultation room. Your patients want to know if you are a member of a county society.

* * *

Refer to the front advertising section of each issue for list of state officers, committees, county societies and their presidents, secretaries, and time of meeting each month. While doing so don't fail to read the advertisements and patronize these patrons of your official journal.

* * *

If in doubt as to the coverage contained in your liability insurance policy, the central headquarters office will be glad to review it for you. Your inquiries are welcome. Be sure to read your policy and ascertain if you are adequately protected. Some policies contain many exceptions.

You throw away money if you pay for the listing of your name in any of the so-called special directories. No business will accrue to you from such listing. It is a sales racket for the sole profit of the publisher.

* * *

Read and know—before signing any document or statement.

* * *

One wastes time perusing the items in publications that are sent to you free. They have been well designated as "Throw Away Publications." You do well to throw them away unread and to devote your time reading recognized journals. Most of these free publication articles are calculated to lead you to prescribe nostrums and unapproved remedies that are of little value. Cease being a "capper" for these drug manufacturers. Read and patronize the advertisers of official medical journals. Be wise.

* * *

We are off to a big year—a fine annual session in Pasadena in May, a definite program of postgraduate instruction for each councilor district, a similar program of lay public health education meetings, the annual session of the American Medical Association in San Francisco, and a general election in November with several vital initiatives on the ballot. Of equal importance are the county society regular meeting programs. Medical history will be made in California in 1938.

* * *

In the event of patients complaining of pain in their lower extremities, it is extremely important that your examination eliminate the diagnosis of thromboangiitis obliterans. This point in diagnosis is particularly important before administering electrotherapy treatments or performing any surgical operation on the toes or feet. Failure to observe this precaution may cause you to undergo some untoward experiences.

* * *

"Do you have any doctors around here?" asked a traveler in a remote wilderness region of the Ozarks.

"Hell, no, we don't want no doctors," replied the bewhiskered native, shifting his tobacco from one corner of his mouth to the other.

"What do you do when somebody is sick?" said the traveler.

"We give him a good drink of whisky."

"Suppose that doesn't do him any good; what then?"

"Then we give him another drink."

"And what if that doesn't help him?"

"We naturally give him another."

"And if that doesn't make him better?"

"Stranger, if a man is so sick that three drinks of whisky don't do him no good, then nobody can't do nothing for him."

The above was lifted from the *New York State Journal of Medicine.* Such individuals compose the group, cited by propagandists and economists, that are without medical care. They are not all confined to the Ozarks.

* * *

The Westchester County *Bulletin* states that "doctors spend an average of $820 per year from their income for insurance protection for life, accident, health, malpractice, automobile, public liability, and compensation." This is deemed to be necessary for their financial and business protection.

Yet, when it comes to county medical society membership and the annual dues, the question is raised as to the value and benefits of membership. Your county medical and state medical associations insure and safeguard your practice and professional interests. Insurance of this nature is not purchasable anywhere other than from your county society. Remember this when paying your annual dues.

DRUG-SAMPLE RACKETS

Is your office attendant, secretary, or nurse abetting this racket? Drug manufacturers advertise in good faith their willingness to send you generous samples of their products and leading preparations.

Thousands of dollars of such samples of standard and approved preparations and drugs are sent monthly to physicians answering these advertisements.

Now steps in the racketeer. He calls at your office, usually outside of your office hours and represents to your office attendant that he is a detail agent. He induces your employee to drop a card or coupon to the manufacturers

requesting samples in your name and instructs her to keep them until he returns in ten days or two weeks. In due time he calls, collects the samples and gives to your employee a dollar, a pair of stockings or a box of candy, and departs with the samples.

By such means the racketeer is able to collect unbelievable quantities of expensive drugs and preparations which are, in turn, sold to certain drug stores at greatly reduced prices, yet at a price that yields him handsome financial returns.

Recently a large manufacturer, upon receipt of an unusually large number of requests for samples from a certain locality, sent the samples to its local detail representative, with instructions to deliver in person to the physicians whose purported request had been received. In over 80 per cent of requests, the doctor admitted that he had not sent in for the samples, but recognized the writing of his employee. These employees admitted that they had been induced to send in the request for samples by a person who alleged he was the manufacturer's representative. In another check-up, a different manufacturer uncovered similar methods of the racketeer.

Physicians can and should put an end to this racket and assist in freeing well-intentioned manufacturers from this imposition. This does not mean that you should cease responding to advertisements, because manufacturers are desirous of meeting your requests for samples. It does mean that you instruct your employees to not give away the samples you receive.

C. M. A. DEPARTMENT OF PUBLIC RELATIONS†

Cut-Rate Fees

A certain automobile insurance company has been, and probably still is, endeavoring to secure the services of one or more physicians in different centers to provide medical care for cases in which it is liable. The bait of "sending all cases to one doctor," "exclusive doctor," volume of business is cast to induce the doctor to sign a contract to render these services for fees scheduled at 25 per cent below the present compensation fee schedule. Just why this company should believe it is entitled to cut-rate fees is not evident. Just why a doctor should cut fees is unexplainable as no justification for doing so exists.

We commend and urge each county society to adopt the following resolution of the San Joaquin County Medical Society:

SAN JOAQUIN COUNTY MEDICAL SOCIETY

December 4, 1937.

"That the Board of Directors of the San Joaquin County Medical Society go on record against accepting any cutting of fees or rebating of the same from the existing Industrial Fee Schedule to any Industrial Accident Insurance Company." This action was further amplified at a meeting of the San Joaquin County Medical Society held December 2, 1937, when the following motion was passed. "That the San Joaquin County Medical Society be placed on record as unalterably opposed to fee splitting or reduction of fees or rebating of fees to the Industrial Accident Insurance Company, that a copy of this resolution be mailed to all members of the San Joaquin County Medical Society and the National Automobile Insurance Company, and that any member accepting work from any insurance company entailing reductions of fees, splitting of fees or rebating of fees be referred to the Committee on Ethics and Professional Conduct for such disciplinary action as the committee sees fit."

This action of the Board of Directors of the San Joaquin County Medical Society and of the San Joaquin County Medical Society is called to your attention so that you might govern yourself accordingly.

Yours sincerely,

G. H. ROHRBACHER, M.D.,
Secretary.

† The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. Charles A. Dukes of Oakland is the chairman, and Dr. F. C. Warnshuis is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. F. C. Warnshuis, Room 2004, Four Fifty Sutter Street, San Francisco.

COMPONENT COUNTY MEDICAL SOCIETIES

ALAMEDA COUNTY

The annual meeting of the Alameda County Medical Association was held at Hunter Hall on Monday, November 15, 1937, at 8:15 p. m., President MacLean presiding.

The following program was presented:

1. *Reports on Legislative Matters* by Ben Read. Mr. Read reviewed the proceedings of the last State Legislature.

2. *Progress Notes on Insurance Association of Approved Hospitals* by Dr. Daniel Crosby. Doctor Crosby reminded the Association that our insurance project is just one year old, the charter having been received on November 16, 1936. He outlined progress, quoted statistical data and discussed the problems which are still ahead.

3. *Tuberculin Test in Connection with Part-Pay Patients* by Doctor Bush. The tuberculin tests should be considered important clinical procedure. He pointed out that the Anti-Tuberculosis Association was making every effort to aid the doctors.

4. *Reports of Committees* as follows:

A. *Report of the Publicity Committee:*

A year ago the appointment of the chairman of the Publicity Committee for the Medical Association was made. The president acted wisely in appointing one member of the Association for each of the standardized hospitals in the county. The program which has been adopted and followed throughout the year has taken into consideration two general principles. First, that the publicity appearing in the various newspapers shall be ethical in character and reflect credit and not reflect discredit upon members of the profession or upon the hospital and secondly, to create a cordial relationship between the various newspapers, the hospitals, the physicians in practice and the profession as a whole. This second proposal has been of great importance and opens a wide field that deserves more cultivation.

The Alameda County Medical Association, a number of years ago, discontinued any connection with any publicity bureau or paid publicity man. While this seemed wise at the time, it does seem to me now that if possible some arrangement should be made so that a definite publicity program could be positively carried out in a fashion that would again have for its purpose the publicizing of appropriate cases, matters of interest happening in the professional world, and particularly some attention given to trends in medical practice.

At no time has the public indicated a greater desire than now to learn of medicine and its problems as well as trends looking toward practice and changes in methods of practice.

Not nearly enough has been accomplished during the past year, but at the same time no particular damage has been done. Under an aggressive program of publicity it is believed that much might be accomplished in years to come, should the Association undertake such a program.

Respectfully submitted,

Signed: B. W. BLACK, M. D.,
Chairman, Publicity Committee.

B. *Report of the Library Committee:*

	1936	*1937*
Attendance	1311	1318
Circulation:		
Books	690	814
Periodicals	2171	2203
Total	2861	3017
Reference questions		1119

Attendance and circulation show another slight increase over the previous year. The number of books added from the fund allowed by the Medical Association was forty-two; gifts, five; one subscription was added to the journals, making a total of eighty-three. A contribution of duplicate numbers of journals was made to the Medical Library Exchange, and several journals needed to complete files were received from the Exchange.

Shelf space was becoming crowded and an additional double-faced stack was installed which will take care of the increase for three or four years.

It was decided by the Library Committee to start a collection of reprints of publications of members of the Association, starting with 1930, and a notice was put in the *Bulletin*. Many contributions to the collection have been made, but it is not yet complete. Any members having reprints of which the library does not have a copy, please let us have one.

The librarian attended the annual convention of the State Library Association at Yosemite in May.

The Library Committee again wants to express its appreciation of the careful conscientious work of our Librarian, Miss Kennedy. After all, a working library is not merely a collection of books and journals, but is largely built around the intelligent service of a skilled librarian.

We also want to thank and to commend the many members of the Medical Association, who both personally and by letter, have given to the Library Committee helpful suggestions and constructive criticism.

H. G. Trimble, *Chairman,*
Wallace T. Partch,
Harold Maloney.

C. *Report of the Committee on Public Health:*

The Committee on Public Health has coöperated with the Chamber of Commerce throughout the past year. No items of unusual interest have been encountered.

F. S. Baxter, *Chairman.*

D. *Report of the Milk Commission:*

Personnel:

The Commission continues to operate under the same personnel as last year, namely, Dr. T. C. McCleave, President; Dr. Edith M. Myers, Secretary; Dr. A. Laurence Gleason, Dr. Rexford Hoobler, and Dr. Ira O. Church.

Dr. Charles J. Parshall of the staff of the Department of Animal Husbandry, of the University of California, is the veterinarian in charge of dairy inspection and laboratory examination. Dr. H. H. Darling of the San Francisco Commission continues to be the examining physician of employees of the dairies for both the San Francisco and Alameda County Commission.

Miss Ruth Manning continues in her rôle of secretary to the Commission maintaining the Commission's headquarters in the Ethel Moore Memorial Building, 121 East Eleventh Street, Oakland.

Meetings and Inspection Trips:

Eight meetings have been held during the year. Two additional meetings have been held jointly with the San Francisco Commission. Five inspection trips were made to the dairies by the members of the Commission.

Dr. Edith Meyers was the Commission's representative to the Atlantic City meeting of the American Association of Medical Milk Commissions in June this year.

Dr. Karl Meyer represented both the San Francisco and Alameda County Commissions at a meeting of the California Association of Medical Milk Commissions held in Los Angeles on April 16 of this year, and at a conference of the Committee on Methods and Standards of the National Association of Medical Milk Commissions held in New Orleans.

Dairies:

Two dairies, Meadowlark Dairy at Pleasanton and Burrough Brothers Dairy at Knightsen were certified by the Commission for the first three months of the present year. On April 1, 1937, Burroughs Brothers Dairy withdrew from such certification on account of other more absorbing interests in the milk industry.

Finance:

Collections and disbursements have been handled by the secretary of the Alameda County Medical Association this year, as in the past year. The amount of funds on hand at the present time is $335.11. All bills are paid and all collections are up to date.

Methods and Standards:

Considerable difficulty has been experienced this past year in keeping within the law in the matter of Methods and Standards, as certain revisions made a year ago by a committee made up of eastern representatives could not be applied to our western dairying conditions. This was corrected, however, at the National meeting in Atlantic City.

Dairy Improvements:

Meadowlark Dairy is, at this time, completing a six months' program of rebuilding. In accordance with modern dairy planning, a large new building of reinforced concrete has been constructed. It will house in its various units, a feeding and washing barn, a holding pen and a milking barn; a bottle washing room and bottle storage room, a very large refrigerating room and a bottle filling room. New and modern equipment is being purchased and installed throughout. The plant is a model of a small dairy and to accommodate the many visitors who are drawn by its wide reputation, large plateglass outside windows have been installed in the rooms—all of which are on a level with the ground.

Edith M. Meyers,
Secretary, Milk Commission.

5. *Reports of the Officers:*

A. *Report of the Secretary:*

During the year 1937, twelve regular and one special council meetings have been held. There have been ten regular monthly meetings at which scientific programs were presented. Thirty-five of our own members and one invited guest, Dr. Dudley Smith, furnished the programs.

Twenty-seven applicants were elected to regular membership and two members were received on transfer from component county societies. Thirteen junior associate members were elected to regular membership and one junior associate member was denied regular membership. Thirteen applicants were elected to junior associate membership. Eight regular members and one junior associate member resigned, six were elected to retired membership. Four regular members died, five transferred to component county societies, six were dropped for nonpayment of dues.

Active members, 501. Junior Associate members, twenty-six. Associate members, two. Retired members, twenty-four. Total, 553.

Submitted at the annual meeting, November 15, 1937.

Gertrude Moore, *Secretary.*

B. *The Treasurer* submitted the report of the auditors.

C. *Report of the President:*

Members of the Alameda County Medical Association:

During the year ten regular monthly meetings were held, at which time an attempt was made to present well-balanced programs on common subjects of interest to all but especially to those practicing general medicine. These meetings have been very well attended. There were no special scientific meetings. The suggestion is made that the giving of a prize to the doctor presenting the best clinical paper during the year be considered. Everyone likes to be rewarded for an effort of distinction.

The Council entertained the Secretary of the American Medical Association, Dr. Olin West, at which time a discussion took place concerning the part Oakland will play during the convention of the American Medical Association in 1938. Also, the secretary of the Bureau of Economics of the American Medical Association lunched with members of the Council, at which time various economic problems were discussed.

The first annual "Hobby Show" took place, and it was surprising to see what beautiful work of various sorts was presented by our members. The show was enjoyed by all who saw it. It is hoped that it will be continued at varying intervals in the future.

The annual banquet was well attended and, for the first time in many years, the doctors entertained their ladies. Judging from the spirit of good fellowship and the amount of jollity which was evident, the object of the banquet, which was to promote friendship among members of the profession, was attained.

Throughout the year, the Council has been endeavoring to get the Approved Hospitals of the Eastbay to make it a ruling that no one be allowed to practice medicine within their walls who is not a member of his County Medical Association. If this were done, unethical physicians, and especially those who verge on quackery, would be forced to go to hospitals where their type of medicine would be, undoubtedly, highly appreciated. It is hoped this effort will continue.

Efforts have also been made to develop a Publicity Bureau through which all medical publicity would pass. The newspapers are agreeable to this and have stated that they will not publish anything except criminal publicity con-

cerning doctors if this plan is carried out. A publicity bureau of this type would do the doctor a great deal of good in printing only accurate information concerning medicine and keeping out misinformation and also publicity which smacks of advertising. It is the plan of Council to finish this piece of work.

Inasmuch as this year was one in which legislators met in Sacramento, much time was devoted to the obtaining of proper legislation and to keeping out improper, destructive legislation. A great deal of this work is done through the California State Medical Association but that Association is greatly aided by the Public Health League, in the membership of which Alameda County boasts only about 175. It is surprising the amount of good work the League has been able to do with the small amount of money it has to work with. It is urged that all members of our Association who can, join the Public Health League. It costs $5 per year and is an excellent form of insurance.

Undoubtedly, during the coming year, some various forms of socialized medicine will be pressed for by governmental agencies. In our own county, the Insurance Association of Approved Hospitals has gone steadily forward and has expanded to surrounding counties. This is undoubtedly a step in the right direction, as it still leaves the proper doctor-patient relationship. Aside from this, we all know there is a large group of individuals that do not get adequate care and this is largely a "white-collared" group of people. As time goes along, some scheme may be worked out which will help care adequately for this deserving group of hard working individuals. So far, the various plans of State medicine which have been presented would, without doubt, degenerate into another form of political bureaucracy.

I wish to thank all the members of the Medical Association for the fine coöperation they have given during the past year. H. Gordon MacLean, *President.*

D. *Report of the Board of Tellers:*

Number of ballots cast, 277; number of ballots discarded because of improperly signed envelopes, five; number of ballots discarded because improperly marked, four.

Officers elected:

President, Dr. Clarence DePuy; Vice-President, Dr. Frank Bowles; and Secretary-Treasurer, Dr. Gertrude Moore.

Council:

Rural: Dr. Clifford W. Mack. Oakland: Dr. H. G. MacLean, Dr. Frank Makinson.

Delegates:

Dr. Leonard Barnard, Dr. John Dougherty, Dr. Sumner Everingham, and Dr. H. J. Templeton.

Alternates:

Dr. T. F. Bell, Dr. W. G. Donald, Dr. Fred Ewing, Dr. Lloyd Kindall, Dr. George Nesche, Dr. Robert Peers, Dr. T. Eric Reynolds, Dr. A. C. Siefert, Dr. D. D. Toffelmeir, and Dr. H. G. Trimble. D. M. Allen,
Chairman of Board of Tellers.

Doctor MacLean then presented Dr. Clarence DePuy, newly elected president. Doctor DePuy spoke briefly of his plans for the coming year. The members were reminded of the meeting to be held in San Francisco to hear Dr. Morris Fishbein.

There being no further business, the meeting adjourned.
Gertrude Moore, *Secretary.*

FRESNO COUNTY

The annual meeting of the Society was held on December 7, 1937, at the University Sequoia Club.

The proposition for membership of Dr. H. W. Pasley was announced.

The following were elected members of the Society: Ernst Aronstein, J. F. Bolkovatz, A. C. Pattison, E. R. Schottstaedt, J. A. Thorman, and J. E. Young.

The annual reports of committees were read.

It was moved by Doctor Pettis, seconded by Dr. J. R. Walker, that the Society endorse the antivenereal disease advertising campaign of the Fresno *Bee.* The advertisements are subject to censorship by the Publications Committee, and without financial obligation to members of the Society. The motion was carried.

The following officers for 1938 were elected: Henry Randel, president; Otto Diederich, first vice-president; R. W. Dahlgren, second vice-president; L. R. Nielson, secretary-treasurer; J. M. Frawley, librarian.

Delegates—G. W. Walker, E. J. Schmidt, and R. S. Scott.

Alternates—C. I. Pendergrass, S. A. Quinby, and B. Sorauf.

Board of Directors—J. M. Frawley.

Doctor Anderson spoke on the danger of buying the wrong kind of Lloyds malpractice insurance, of which there are some thirty different kinds. He advised members to consult Hartley Peart, General Counsel of the California Medical Association, before buying.

The scientific program consisted of talks on *Purpura Hemorrhagica* by Dr. Stacy Mettier of San Francisco, and *Acute Gall-Bladder* by Dr. Glenn Bell of San Francisco.
O. B. Doyle, *Secretary.*

HUMBOLDT COUNTY

The Humboldt County Medical Society met on the evening of December 2, 1937, at Eureka Inn, at 6:30 dinner.

The following officers were elected for 1938: Francis Stump, president; L. G. Kramar, vice-president; John A. Lane, treasurer; Lawrence A. Wing, secretary. Delegate, Allan Watson. Alternate, Lane Falk.

The papers of the evening were especially good. Dr. H. Glenn Bell spoke on *Acute Cholecystitis,* and Dr. Stacy Mettier on *Medical Aspects of Arthritis.*

The members enjoyed the visit of our State officers, Dr. Henry Rogers, Councilor, and Dr. Frederick Warnshuis, State Secretary. These officers gave a very excellent report on State Association activities and legislation.

Résumé of meetings for 1937:

President, Allan Watson.

Meetings held, 7; average membership present, 17; visiting speakers, 9; visiting State officers, 2.

After a very enjoyable evening the meeting adjourned.
Lawrence A. Wing, *Secretary.*

KERN COUNTY

The Kern County Medical Society met in regular session at the El Tejon Hotel in Bakersfield on Thursday evening, November 18, Dr. H. R. McAllister presiding. Dr. Lloyd Fox announced plans for the annual banquet to be given on December 18 at the Stockdale Country Club.

The following officers were elected for 1938: President, Dr. Harry W. Lange; Vice-President, Dr. H. A. Rivin of Delano; Secretary, Dr. C. S. Compton; Board of Directors, Dr. Peter J. Cuneo, Dr. L. A. Packard, Dr. Frank J. Gundry; Delegate, Dr. C. S. Compton; Alternate, Dr. Frank J. Gundry.

Because of the widespread interest in the problem of coccidioides infection in the San Joaquin Valley, the Society welcomed the opportunity of hearing Dr. Ernest C. Dickson of Stanford University, who was the speaker of the evening. Doctor Dickson spoke on the *Relation of Coccidoides Infection to "Valley Fever."* He asked the cooperation of the Society in the field study he has undertaken in the San Joaquin Valley. In spite of the great incidence of "valley fever" or so-called erythema nodosum in the Valley, it is only recently that its possible relationship to coccidioides infection has been investigated in Kern County, where a large number of affected patients are seen each year. The Society voted to coöperate with Doctor Dickson in his study in reporting all cases of "valley fever" and especially to aid in the bacteriological studies of sputum from the patients. Dr. Charles E. Smith, associated with Doctor Dickson in this investigation, spoke briefly on the plans and a number of slides illustrating the pulmonary findings in "valley fever" and in clinical coccidioidal granuloma infection were shown.

The meeting was adjourned, following which refreshments were served. C. S. Compton, *Secretary.*

PLACER COUNTY

The Placer County Medical Society held its regular meeting at the Freeman Hotel, Auburn, on December 11, 1937, with the president, Dr. C. E. Lewis, presiding. In addition to President Lewis there were present the following members and visitors:

Members—Doctors Kindopp, L. B. Barnes, Smith, Rood, Lundegaard, Thoren, Hummelt, Atkinson, Vinks, Hirsch, Russell, Peers, and Miller.

Visitors—Doctors Robert Stewart Peers, Herman V. Allington and Thomas I. Buckley, all of Oakland, and Doctor Ward of Auburn.

Following the reading of correspondence, the application of Dr. Edwin Slater Peeke was read for the first time.

Doctors Ray C. Atkinson and Daniel L. Hirsch presented a preliminary report for the Committee on Fee Schedule.

The president then introduced Dr. Thomas I. Buckley of Oakland, who presented a paper on *Urinary Antiseptics* in which he stressed culturing the urine and using mandelic acid therapy for the bacillary group, and sulfanilamid in small doses for the Streptococcus hemolyticus group. He also discussed other urinary antiseptics from their historical as well as their therapeutic efficiency.

Dr. Herman V. Allington of Oakland discussed *Eczematous Eruptions* and illustrated his talk with lantern slides. He pointed out that eczematous eruptions are characterized by red, infiltrated, blistering, weeping, crusting and scaling lesions, and by itching and burning. They may be due to external irritants (dermatitis venenata) or indirectly to internal organic disturbances, ingestion of drugs, and foci of infection. Allergy is an important consideration. In treatment one should first attempt to locate and remove the cause. Local medication should be primarily soothing and protective, with more active and stimulating remedies reserved for the chronic infiltrated forms.

Dr. Robert Stewart Peers, also of Oakland, presented a paper on *The Relation of Gall-Bladder Disease and the Rheumatic Syndrome*. This was a preliminary study of twenty-eight selected cases. These individuals were considered from their type of chronic arthritis and sedimentation tests and gastric complaints and age groups with the roentgenological findings by routine x-ray visualization. An outline of the care of these patients was also suggested.

These very interesting papers evoked considerable discussion.

Following adjournment, refreshments were served.

ROBERT A. PEERS, *Secretary*.

SACRAMENTO COUNTY

The regular meeting of the Sacramento Society for Medical Improvement was called to order by President Raymond Wallerius on October 19, 1937, at the Auditorium on Twenty-ninth and L streets. There were fifty-nine members and guests present.

Doctor Wallerius reported on the case of a forty-year-old woman with osteomyelitis of the tibia, who has been going about town attempting to get morphin.

Speakers of the evening were members of our Society who had attended various clinics and medical congresses, both in the United States and abroad, during the past year.

Dr. O. S. Cook, in his talk, emphasized the method of treating carcinoma of the breast by preoperative x-ray up to 300 r at Adair's Clinic; and the method of doing biopsies by means of a long aspirating needle; the use of radium up to 9,000 milligram hours in the treating of carcinoma of the cervix at the Mayo Brothers Clinic; the treatment of carcinoma of the bladder by means of radium implants used at the Dean and Barringers Urology Clinic; and the treatment of carcinoma of the tongue by means of cones, which fit into the mouth, at the Hays Martin head and neck clinic.

Dr. Ralph Graham spoke on the International Congress of Radiologists at Chicago. The essential points stressed by Doctor Graham were the effect of x-ray on the healing of wounds; the use of x-ray therapy in treating infections, bites, furuncles, carbuncles, cellulitus; and the good results from the use of x-ray in the treatment of lobar pneumonia. The use of x-ray therapy in bronchiectasis and gas-gangrene infections was also suggested.

Doctor Hale told about his experiences and type of work seen at the various European clinics visited; the modern hospitals in London; the use of avertin intravenously by the drop method over a period of hours, as seen at Leningrad, Russia; the use of intravenous diatrast for diagnosis as the only method used in Moscow; and the work on tuberculosis of the kidney as seen in Weilderbold's Clinic in Switzerland. Doctor Hale remarked about the absence of prostatic resections in Europe.

Dr. G. J. Hall spoke on female endocrinology and new hormones, as taken up at the meeting of the Society for the Study of Internal Secretions. Prolactin, a milk forming hormone, and its effect on endometrial hyperplasia was discussed. Doctor Hall stressed the danger in using prolactin for the production of milk because of its action in reducing the function of the ovaries.

Doctor Rulison told of his visit to the International Congress of the Radiologists at Chicago, and was most impressed by the excellent life-size models on diaphragmatic hernia and pictures of the surgery on that type of hernia. Harrington's results on surgical treatment at the Mayo Clinic were discussed, as well as the symptoms found in cases of paraesophageal hernia.

Dr. Hilding R. Johnson showed some excellent motion pictures taken while on his Alaskan trip.

The applications for new membership of Doctors Roscoe Clark, James Yant, Aaron Gourse, Adrian Crossen, and Godfrey Steinert were voted upon and all were elected to membership. The application of Dr. R. O. Schofield for membership by transfer was read for the first time.

Doctor Dozier announced the meeting of the Northern District Medical Society at the Elks Club on November 6.

* * *

The regular meeting of the Sacramento Society for Medical Improvement was called to order by the President Raymond Wallerius on November 16, 1937, at the Auditorium on Twenty-ninth and L streets. There were sixty-three members and guests present.

Dr. L. Taussig of the University of California Medical School presented the first paper of the evening. He discussed *Dermatological Conditions Associated with Diabetes Mellitus*. Doctor Taussig first discussed the relation between the high glucose content of the skin in diabetes and its relation to skin infections. That the amount of sugar in the skin is definitely increased with and increase in blood sugar has been proved experimentally; but there apparently is no proof so far that this causes an increase in susceptibility to skin disease. Doctor Taussig then took up the skin conditions most commonly associated with diabetes, *i. e.*, eczema, chronic urticaria, pruritus, purpura, gangrene, and xanthoma. The roll which diabetes plays in such cutaneous infectious as furunculosis, dermatophytosis, and pruritus, is not known. The paper was concluded by showing lantern slides of some of the cases discussed.

The second paper of the evening was presented by Dr. H. C. Shephardson, who spoke on the *Use of Prolonged Acting Insulins*. Doctor Shephardson opened his discussion by stating that one-half per cent of all the people are afflicted with diabetes, and that one per cent of all the people die of the disease. In comparing the two insulins now in use, it has been found that the maximum effect of regular insulin is attained in three to four hours, whereas the protamin insulin attains its maximum effect in twenty-four hours and acts over a period of seventy-two hours. Protamin insulin has a cumulative effect, and hence the danger of producing a state of hypoglycemia slowly in the patient, with resultant permanent mental changes. This appears to be the main danger in its use. The main contraindications to the use of protamin insulin are (1) infections, such as gangrene and septicemia; (2) treatment of coma. Protamin insulin acts too slow in these cases. Protamin insulin is of the utmost value in children where the number of injections can be cut down greatly, and as a result enables the physician to control these diabetic children without the use of the needle so often. Doctor Shephardson next mentioned the new U80 protamin insulin which is now on the market, and a new crystalline insulin which will soon be available.

The discussion on the papers was opened by Doctor Scatena and continued by Doctors E. Sevier, Frank Lee, and Aaron Gourse.

The application for membership, by transfer, of Dr. R. O. Schofield was read for the second time and voted upon. He was elected to membership unanimously.

Dr. F. F. Gundrum asked that the Society take up the matter of the old minutes of the Society, and stated that he felt these old records should be preserved in a safe place for their historical value. A motion was made and so passed that the officers of the Sacramento Society for Medical Improvement arrange to deposit all such minute books in the State Library in the California section.

Dr. J. B. Harris requested the Board of Directors to take up the matter of a uniform listing of physicians in the telephone directory (classified section).

G. E. Millar, *Secretary.*

SAN BERNARDINO COUNTY

The regular meeting of the San Bernardino County Medical Society was held at the San Bernardino County Charity Hospital on Tuesday, December 7, 1937, at 8 p. m. The meeting was called to order by the president, Dr. D. B. Williams. About sixty members and guests were present.

The application of Dr. Kenneth E. Kellogg of Loma Linda was favorably voted on.

Dr. Lowell Goin, Speaker of the House of Delegates of the California Medical Association, presented facts regarding the medical economic survey made by the California Medical Association some four years ago, and also discussed the *Principles and Proposals* brought about by the *Committee of Four Hundred and Twenty* and stressed a united front by the profession, regardless of an occasional individual's feeling in the matter.

The program of the evening was given as follows: *The Use of Convalescent and Normal Human Serum in the Treatment of Disease* by Dr. Hugh K. Berkley of Los Angeles; *The Convalescent Serum Center and Its Value to the Community* by Dr. C. M. Hyland of Los Angeles.

Informal discussion and questions followed.

The meeting adjourned at 10 p. m., following which refreshments were served.

Arthur E. Varden, *Secretary.*

SAN FRANCISCO COUNTY

The annual report of President T. Henshaw Kelly follows:

The Board of Directors of your Society held its usual regular meetings throughout the year and special meetings on May 24 and September 8, 1937.

During the year, invitations were issued by the Board to the American Medical Association, the American Association of Military Surgeons, and the International Society for Crippled Children, to hold annual meetings in San Francisco. The American Medical Association, as you know, will meet here, beginning June 13, 1938.

The Board considered the matter of blackface type advertising in the telephone directory and requested all members of the county society who indulge in this type of listing in the telephone book to discontinue it, as it is against the policies set up by all principles of ethics.

The matter of speaking before lay groups in other counties by our members was also brought before the Board by the component societies of other counties, who objected to some of the talks thus given. The Board, in justice to other county societies, who cannot control our members, ruled that no member of this Society shall go into another county to talk before a lay group, without receiving the permission of the component county society of the county in which he intends to speak. It has been suggested that a committee be appointed whose duty it shall be to pass upon the fitness of any intended speech by a member to a lay group in the City and County of San Francisco.

Nineteen hundred and thirty-seven saw a biennial meeting of the legislature, and foremost in that session was again the matter of health insurance, activity being along two lines—one by the California Medical Association, designed to permit the physicians of any county to organize and operate a health insurance association; and the other, by existing illegally operating agencies, to legalize themselves and to permit the formation of other loosely organized and supervised agencies. Many of our members gave of their time and effort to further the purposes of the Association, but the legislature adjourned without enacting such legislation.

A move by the Farm Bureau and others to legalize the opening of county hospitals to pay patients was defeated.

The Board approved a bill to prevent untrained and unlicensed laymen from setting up diagnostic and therapeutic x-ray laboratories. This bill was presented to the legislature, passed and pocket-vetoed by the Governor.

On November 30, the Society gave a dinner to Dr. Morris Fishbein, who spoke on the present trends in medical economics in the country. The dinner was attended by 260 members of the San Francisco and other Bay counties societies.

During the year the Society approved a proposed amendment to the Charter designed to remove the office of the Director of Public Health from politics. However, this proposed amendment did not reach the ballot.

It approved the bond issue on the last ballot to provide for improvements at the County Hospital and the Laguna Honda Home, and this was one of the few issues passed by the voters.

Because he is a physician who has devoted himself, as a Supervisor, to assisting medicine and its aims in the City and County government, the Board endorsed the candidacy of Dr. Adolph Schmidt for Supervisor. He was elected.

The Committee on Malpractice Insurance—Doctor Gilman—has done an immense amount of work this year to keep abreast of the changes in malpractice insurance policies which have taken place during the year.

Yearly the coverage and cost of this insurance are decreasing and increasing respectively, and the field has been confused by the appearance of a large number of types of policies written by Lloyd's of London, practically no two of which are alike and many no good. The American companies still writing this insurance have decreased their coverage and increased their costs, and Doctor Gilman is preparing a short report of the present situation, which is to be published in the *Bulletin* either in January or February. Every member should read this and should carefully investigate the actual coverage that his present malpractice policy gives him.

Finally, we come to the matters dealing with the economics of medical practice that have come before the Board during the year.

Previous to 1937, the Shell Oil Company had endeavored to establish a fee schedule and panel of physicians to care for its employees in and about San Francisco. After discussion, argument and distress produced by publication of letters in the *Bulletin,* during this year the Shell Benefit Fund has paid members of this Society for their care of Shell employees and have done so on the basis of their reasonable charges rather than on a panel fee schedule. We hope it will keep on.

The Pacific Employers Insurance Company has recently completed, in conference with a committee of the Board of Directors of your Society, a policy form providing indemnity for medical and hospital costs which is in all ways satisfactory to your Board of Directors. It is indeed an encouraging sign when a company of this standing asks the help and coöperation of the Society in the formulation of such a policy.

The year has seen the establishment of the Insurance Association of Approved Hospitals in San Francisco. As you know, in order that we might have a unified hospital service plan in the Bay region, the San Francisco Society, instead of starting an independent organization, approached this Association in Alameda County and the hospitals in San Francisco County, and an agreement was reached whereby the Insurance Association of Approved Hospitals and nine San Francisco hospitals signed contracts, opened a San Francisco office and began to sell hospitalization insurance policies. Representation of San Francisco medicine and hospitals will be given on the Board of the Approved Hospitals, and the whole project has been worked out harmoniously and effectively. The other Bay region counties have joined in, and the one organization can take contracts for the whole Bay region. The Board appropriated $1,000 to use for promoting the start in San Francisco.

This accomplishment is due, for our part, to the Committee on Health and Hospitalization Insurance, consisting of Drs. Karl L. Schaupp (chairman), J. Marion Read, and Rodney A. Yoell. The Society owes these members its

thanks for their unremitting effort and uncounted hours of time spent in this work and in the other project that came within their purview.

That project is the Health Service of the City Employees of the City and County of San Francisco. As most of you know, this was conceived by the Federation of Municipal Employees, and a proposed amendment to the Charter was presented to the Board of Supervisors in late December for placement on the ballot in the spring election. The terms of this proposed amendment were very objectionable to us and, despite the fact that the Federation's representatives laughed at our committee when it said we would not accept them, we succeeded, with the hospitals, dentists, druggists, grocers, and other interested parties, in so amending the amendment in the Board of Supervisors that it required the Health Service Board, created by the amendment, to provide free choice of physicians, hospitals and other agencies of medical care, and to present, for approval to the Retirement Board any contract or schedule of fees under which it proposed to operate any health service plan.

The Board of Directors of your Society then approved this Charter Amendment. It was passed by the voters, and the city employees then proceeded to elect a Health Service Board under the terms of the Charter Amendment.

This Board then proceeded to dilly dally with our committee for months in an attempt to get from it a fee schedule which it could promulgate as our fee schedule, but the committee refused any schedule except as an integral part of a worked-out plan.

The Health Service Board then signed a contract with the Sutter Hospital group, hired three physicians to make up a fee schedule and then presented these two matters to the Retirement Board for its approval. After four hearings, at which our committee and legal counsel appeared, as well as representatives of the hospitals, nurses, pharmacists, etc., the Retirement Board disapproved both the contract and the fee schedule.

The Health Service Board is now working on some other plan and is to meet with our committee tomorrow night, at which time our committee will present a plan, authorized by the Board of Directors, as a basis for the development of a working agreement. What the outcome of this will be, we do not know. We are anxious to work with the Health Service Board, for whatever develops from this Amendment will doubtless be a pattern for other communities, and we should like to develop a plan that will provide the best of care without undermining the basic tenets of medical practice. So far, coöperation has not been the outstanding characteristic of the Health Service Board, or at least, of some of its members.

It has been a busy year. In practically my last words as president I want to thank you all for my office. I have enjoyed it and hope that I have justified the choice.

More do I want to thank those who worked with me, pleasantly and so faithfully, to carry out those things which presented themselves for doing. T. Henshaw Kelly.

❦

SAN JOAQUIN COUNTY

The annual meeting of the San Joaquin County Medical Society was held on December 2 in the Walnut Room of the Hotel Clark. The meeting was called to order by President John Blinn. A very excellent dinner was served.

The petition of Dr. H. E. Schwing of Standard, California, was read and referred to the Admissions Committee.

The annual report of the secretary-treasurer was read and approved. It was moved by Dr. D. Powell, seconded from the floor, that the secretary-treasurer be given a vote of thanks for the splendid work done in 1937. The motion was carried.

Dr. C. A. Broaddus read a report of the Postgraduate Committee.

There was considerable discussion from the floor concerning the attempts of the National Automobile Insurance Company to have practitioners in this county rebate 25 per cent of their fees to this company. It was moved by Doctor Van Meter that the San Joaquin County Medical Society be placed on record as unalterably opposed to fee splitting or reduction of fees or rebating of fees to the National Automobile Insurance Company; that a copy of this resolution be mailed to all members of the San Joaquin County Medical Society and the National Automobile Insurance Company; and that any member accepting work from any insurance company entailing reduction of fees, splitting of fees, or rebating of fees, be referred to the Committee on Ethics and Professional Conduct for such disciplinary action as the Committee sees fit." This was seconded by Dr. C. V. Thompson. The motion passed.

The following are the results of the election, reported by the Elections Committee:

A. C. Boehmer, president; N. P. Barbour, first vice-president; F. A. McGuire, second vice-president; G. H. Rohrbacher, secretary-treasurer.

Directors—G. H. Sanderson, H. C. Chapman, C. V. Thompson, C. A. Broaddus, J. F. Blinn, D. Powell, and J. F. Doughty.

Delegates—D. Powell, G. H. Sanderson, and J. F. Doughty.

Alternates—C. A. Broaddus, G. H. Rohrbacher, and C. V. Thompson.

The paper of the evening was presented by Dr. Phillip King Brown of San Francisco, who spoke on *These Changing Times in Medicine: With an Interpretation of Some Observations on Medical Practice in Mexico.*

There being no further business to come before the Society, the meeting was adjourned at 10:45 p. m.

G. H. Rohrbacher, *Secretary.*

❦

SHASTA COUNTY

The Shasta County Medical Society had its last meeting at the Hotel Redding on November 15, 1937. The meeting was called to order by President O. J. Hansen.

The fact that there were three cultist practitioners recently arrived in Redding for the purpose of practicing, and the fact that they were allowed to practice surgery and medicine in the St. Caroline Sanitarium, caused the following motion to be brought up and passed:

"That the Shasta County Medical Society go on record to discountenance the aiding, abetting, assisting, or employing any person who professes to practice a system of treatment of the sick other than regularly licensed doctors of medicine, graduates of approved medical schools, by any member of the Shasta County Medical Society. Any member violating this rule will be expelled from the Society in accordance to his agreement in entering the Society."

Members present were: Doctors Hansen, Seeley, Olberg, Pratt, Kay, and Dozier. Guests were: Doctors Murphy and Falk. Leslie J. Seeley, *Secretary.*

❦

SOLANO COUNTY

A regular annual meeting of the Solano County Medical Society was held at the Casa de Vallejo Hotel at 8:30 p.m. December 14, 1937, the meeting being called to order by President Perkins.

A motion was passed that members of the Society prescribe no drugs except those accepted by the American Medical Association, and that California and Western Medicine be requested to print a list of new and nonofficial remedies periodically. Motion carried unanimously.

The secretary was instructed to write a letter to Senator Hiram Johnson and one to Congressman Buck, urging them to vote for a revision of the Pure Food and Drug Act which would shortly be introduced in Congress. The secretary was instructed to sign the names of all members of the Society to this letter.

The secretary asked the older members whether they could remember seeing a charter for the County Medical Society at any time during the Society's history. Doctor Peterson and Doctor Leachman, who were the oldest members present, could remember no charter having been presented to the Society. A Constitution Committee is to be appointed by the incoming president to revise our present Constitution.

Dr. Johann Couperous of Rio Vista was accepted as a member of the Society by unanimous vote.

A motion was made by Doctor Parks and seconded by Doctor Finan that meals reserved at our monthly dinners which are not cancelled before the meeting shall be billed to the member making the reservation. Unanimously carried.

Election of officers resulted as follows: Dr. Ream S. Leachman, Vallejo, President; Dr. Milford Bransford, Vallejo, Vice-President; Dr. John W. Green, Vallejo, Secretary-Treasurer; Delegate, Dr. John W. Green; and Alternate, Dr. D. B. Park.

The same Board of Censors will continue to serve until a new Constitution is presented and approved.

A report was made by the secretary on the address made by Dr. Morris Fishbein, Secretary of the American Medical Association, which was delivered at San Francisco at the Palace Hotel on the evening of November 30.

The secretary also discussed the final report of the California Medico-Economic Survey, stressing certain points made in the informal comments concerning possible interpretations and conclusions to be drawn from the factual data, and also commended the good sense of the Official Committee on Publication consisting of Dr. Howard Morrow, Dr. Edward Pallette, and Dr. George Kress.

The Society was once more invited to become more familiar with California and Western Medicine.

The Committee on Post-graduate Study, Dr. A. V. Doran, Chairman, and the committee which was appointed to meet with the women's clubs, were discharged with thanks for past services.

The secretary discussed the recent study made by the Solano County Institutions Committee, appointed by the supervisors with a view to better medical service for our indigents without increased costs to the taxpayers, and suggested that a revolving staff for the County Hospital to serve without pay might be an advisable step.

Proposals for medical defense were then taken up and applications for membership in the Medical Society of the State of California were presented to each member and they were encouraged to remit $10 to the Society for legal defense in case of suits for malpractice. It was also brought out that a policy written by Lloyd's of London was available through the firm of Newhouse & Sayer which supplied indemnity of from $50,000 to $150,000 for approximately $55 per year. Attention was also called to the fact, that because there were many so-called "Lloyd's Policies," some with and others with less merit, that before signing up, it was advisable to write to the central office of the California Medical Association for further information.

John W. Green, *Secretary.*

VENTURA COUNTY

The regular monthly meeting of the Ventura County Medical Society was held at the Saticoy Country Club on Tuesday, November 9, 1937.

Members present were: Doctors Hendricks, Coffey, C. A. Smolt, Shore, Mosher, Bardill, Drace, Gronhovd, Barker, and Morrison. Guests were: Doctors Pressman, Hirchfield, Kuffel, Garrett, Moore, and Witten.

Dr. J. J. Pressman of Los Angeles presented moving pictures of the larynx and vocal cords in normal and pathologic states. The members present expressed great interest in these pictures.

It was decided that the December meeting would be given over to the annual election of officers.

A. A. Morrison, *Secretary.*

John B. Hollingsworth, from Yolo-Colusa-Glenn County to Alameda County.

Richard O. Schofield, from Placer County to Sacramento County.

In Memoriam

Fehliman, William Edward. Died at Portland, Oregon, November 25, 1937, age 57. Graduate of Rush Medical College, University of Chicago, 1906. Licensed in California in 1919. Doctor Fehliman was a member of the Santa Cruz County Medical Society, the California Medical Association, and the American Medical Association.

✝

Hull, Leonard Charles. Died at Hollister, November 26, 1937, age 67. Graduate of Cooper Medical College, San Francisco, 1893. Licensed in California in 1894. Doctor Hull was a member of the San Benito County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✝

Rea, Thomas. Died at Yreka, December 1, 1937, age 57. Graduate of Oakland College of Medicine and Surgery, 1913, and licensed in California the same year. Doctor Rea was a member of the Siskiyou County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✝

Styan, William Earnshaw. Died at San Francisco, November 24, 1937, age 63. Graduate of the College of Physicians and Surgeons, San Francisco, 1906. Licensed in California in 1909. Doctor Styan was a member of the San Mateo County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✝

Wall, Albert Samuel. Died at Los Angeles, September 9, 1937, age 76. Graduate of Miami Medical College, Cincinnati, Ohio, 1890. Licensed in California in 1917. Doctor Wall was a retired member of the Los Angeles County Medical Association, the California Medical Association, and the American Medical Association.

OBITUARY

William Edward Fehliman

1879–1937

A motor accident while returning to his home from his favorite recreation, elk hunting, caused the death of Dr. William E. Fehliman, one of the best known and loved of Santa Cruz physicians, on November 24, 1937.

William E. Fehliman was born near Sedan, Indiana, on September 16, 1879. His family soon moved to Nebraska and his boyhood was in that state. After an academic course at the University of Chicago a medical career was begun at Rush Medical College, from which he was graduated in 1906. Following an internship at Cook County Hospital, Doctor Fehliman entered practice at Lead, South Dakota, and continued at that place until entering the

service of his country in 1917. While in Lead Doctor Fehliman was married to Lola Inez Shackelford, who now survives. From 1917 to 1919 Doctor Fehliman served as captain in the Army Medical Corps, being attached to the New York 77th Division, the greater portion of his army career being at the front in France.

Following the war, Doctor Fehliman came to Santa Cruz in 1917 and associated himself with Dr. Stanley W. Dowling in the practice of medicine. During his years of practice in Santa Cruz Doctor Fehliman gained the respect and confidence of the community. His ability and tireless efforts in the behalf of those in need were appreciated not only by his patients, but also by those who knew him only as a friend. His untimely passing is a distinct loss to the community of Santa Cruz.

Doctor Fehliman was a member of the Santa Cruz County, California, and American Medical Associations.

SAMUEL B. RANDALL, M.D.

✝

John Randolph Haynes

1853–1937

October 30, 1937, recorded the death of Dr. John Randolph Haynes, age 84.

Doctor Haynes was born at Fairmont Springs, Pennsylvania, June 13, 1853; he received his M.D. degree from the Medical School of the University of Pennsylvania in 1874. Was in private practice in Philadelphia until the year 1887, at which time he came to California.

Two years later he became a member of the faculty of the then College of Medicine of the University of Southern California, as associate professor of gynecology .

Some years ago Doctor Haynes practically retired from private practice.

In CALIFORNIA AND WESTERN MEDICINE of July, 1937, on page 37, appeared a photograph of Doctor Haynes and a brief article containing newspaper excerpts made on the occasion of his eighty-fourth birthday.

From the Los Angeles *Examiner:*

Dr. John R. Haynes, the "grand old man of municipal ownership" in Los Angeles, blew out the candles on his birthday cake in the quiet parlor of his Figueroa Street home yesterday and settled back in his chair to talk of his fifty years in the city and of things to come in the next fifty years.

He was eighty-four years old. During the last half-century, as a liberal whose faith would not fail, he had served his city, his state, and his country; his creed, democracy, and his cause, municipal ownership. Since 1921 he had served as a member of the Water and Power Commission. . . .

The achievement Doctor Haynes finds most pride in was the writing into the California Constitution of the initiative, referendum, and recall, California being the first state to adopt these measures, which were considered ultra-liberal at the time of their proposal.

The Los Angeles *Herald-Express,* in an article concerning Doctor Haynes, reported as follows:

Bequeathing the bulk of his estate to the cause of promoting the well-being of mankind, particularly the working people, the will of Dr. John R. Haynes, civic leader, philanthropist and president of the Los Angeles Water and Power Commission, was filed on October 15.

This humanitarian work, the will provides, shall be carried out through the trustees of the John Randolph Haynes and Dora Haynes Foundation, which was created by Doctor Haynes and his wife in September, 1926.

While Doctor Haynes had been reputed to be a millionaire, it was stated that in recent years he and his late wife, Dora Haynes, had given away large sums for charitable purposes and that the property remaining probably would amount to less than a million dollars, but more than $500,000. Doctor Haynes died last Saturday at the age of eighty-four.

After a number of bequests to relatives, the will bequeathed the residue to the Foundation. This residue, with large endowments made by Doctor Haynes and Mrs. Haynes since its organization, will give the Foundation a working capital of approximately one million dollars, it was reported today.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION†

MRS. HOBART ROGERS President
MRS. FRED ZUMWALT Chairman on Publicity

News Letter

Dear Auxiliary Members:—The holidays are now over and I hope that, for each and all of you, they were pleasant ones. You will be delighted to know that when Christmas gifts were being distributed the Auxiliary was not forgotten. *A present of two new counties!* That is what your State Chairman of Membership and Organization, Mrs. Frederick N. Scatena of Sacramento, has given to you. These two counties are Butte and Santa Cruz, and they are splendid and welcome additions to a splendid organization. With the acquisition of these counties we now have all (those that are more thickly populated) of the larger counties organized. This is a very fine record for the short period that the Auxiliary has been in existence in the State of California—eight years, to be exact. But let us not be satisfied until *every county* is organized and *every woman* who is eligible a member.

Both of these recently formed counties have already sent in reports of their organization meetings. They are printed just below in this issue; be sure to read them. Personally, I wish to thank them for their prompt coöperation.

The goal of our president when she took office was a 100 per cent membership, and some of the counties are helping her to attain it. Mrs. Rogers' own Auxiliary, Alameda County, has taken in over thirty-two new members in less than two months. Los Angeles County has signed up, in one month's time, sixty-one new members! And "lest we forget," Marin County has a membership of thirty-seven and there are but thirty-nine eligible women in the county.

If any of the other counties have reports of this kind to give, please send them in, for "nothing succeeds like success."

Sincerely yours,

MRS. FRED H. ZUMWALT.

Component County Auxiliaries

Alameda County

Members of the Alameda County Auxiliary met on Friday, November 19, 1937, at luncheon in the dining room of the Claremont Country Club. The meeting that followed was in the Lounge. As usual, an informal half-hour of reception, presided over by Mrs. George Reinle, preceded the affair. Reservations were in charge of Mrs. O. T. McAllister.

Reports of board members' activities were given at the business meeting, at which the president, Mrs. A. A. Alexander, presided. Mrs. Harold Trimble, state chairman of *Hygeia,* in an interesting and stimulating talk, told of this publication of the American Medical Association and urged each member to see that it be placed in at least one home this Christmas. Mrs. W. H. Sargent, past president of both the Alameda County and California State Auxiliaries, also spoke on the value of *Hygeia,* and then gave a short report of the work done by the Auxiliary's Battalion in the Community Chest drive. We were proud to hear that our workers had gone over the 100 per cent mark set for us.

Dr. Benjamin Black, Director of Alameda County Institutions, was the honored guest. His subject was relative to his work as a public health director. As he is one of

† As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Fred Zumwalt, Chairman of the Publicity and Publications Committee, 3880 Clay Street, San Francisco. Brief reports of county auxiliary meetings will be welcomed by Mrs. Zumwalt, and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue to Woman's Auxiliary notes.

our most popular and delightful speakers, the attendance was large; many expressed the wish that we have the privilege of hearing Doctor Black more often.

The next meeting of the Auxiliary will be held at the Claremont Country Club in January, at which time a very fine program of both medical and cultural interest will be presented.

Our membership now totals 292! We are happy to welcome the following members: Mesdames E. W. Page, T. C. McCleve, Hewitt Robinson, J. T. Harkness, Erwin Epstein, Fred Fisher, Gale Whiting, W. W. Nicholson, Floyd Lewis, W. E. Hart, R. G. Libby, R. J. Walker, Ronald W. Troup, W. S. Williams, E. J. Jakemy, C. E. Cocks, Don Manley, P. H. Miles, and E. M. Grimmer.

Mrs. Grant Ellis,
Chairman of Publicity.

❦

Butte County

Wives of the members of the Butte County Medical Society met on Tuesday, November 9, 1937, relative to forming a Woman's Auxiliary.

Mrs. Frederick N. Scatena of Sacramento, First Vice-President of the State Auxiliary and State Chairman of Membership and Organization, was the guest of honor and gave an interesting talk, telling of the need and value of the Auxiliary organization throughout the state and nation. She spoke of the success and organization history of her own county, Sacramento.

After the address by Mrs. Scatena, a short business meeting was held at which initial plans of organization were formed and the following officers elected: Mrs. J. H. White of Chico, president; Mrs. W. H. Barnes of Chico, vice-president; Mrs. J. H. Alexander of Chico, secretary; Mrs. L. A. Jacoby of Oroville, treasurer. The directors are: Mesdames N. T. Enloe, C. C. Landis, J. H. Fabrian, and J. G. Hepplewhite.

At the conclusion of the meeting, tea was served.

Mrs. J. H. White,
President.

❦

Los Angeles County

The Woman's Auxiliary to the Los Angeles County Medical Association met for luncheon on November 23, 1937, at the County Medical building, Mrs. Eliot Alden presiding.

A group of songs was rendered by Miss Martha Friedberger. Mrs. Robert Heffner gave a most interesting talk on her work as referee at the Juvenile Hall. Medical highlights were presented by Mrs. Karl von Hagen.

The Philanthropy Committee, in charge of Mrs. Harold E. Crowe, had asked for contributions of canned food for the Thanksgiving baskets, and they were collected at this meeting. This committee functions at holiday seasons, distributing staple foods, fruit, candies, and magazines to the families of a few needy doctors in the county.

Mrs. Robert L. Carroll,
Corresponding Secretary.

❦

Marin County

A very enjoyable luncheon meeting was held on Thursday, November 18, 1937, at the Alta Mira Hotel in Sausalito. There were twenty-one present.

Mrs. Furlong announced that there was a contest on for *Hygeia*. It was decided that the Auxiliary should have a card party to raise funds for subscriptions to *Hygeia*. Mrs. G. Landrock was appointed committee chairman. Her committee members are Mesdames Marston, Miller, Hawkins, and Robinson.

Mesdames Polland, Hazeltine, Fowler, Robertson, and Conroy were appointed as a new committee to determine the philanthropic work of the Auxiliary.

Mrs. Hobart Rogers, State President, and our first guest speaker, was then introduced. Mrs. Rogers gave us a brief and inspiring talk on the purpose and ideals of the organization. She mentioned the many things that it had accomplished and the hopes that she had for its future.

Mrs. Charles Hall, State Corresponding Secretary, then thanked Marin County for its coöperation and urged us to keep up the good work.

Miss Edith Waterman, Chairman of the Red Cross in San Rafael, was then introduced and told of the numerous services the Red Cross had rendered during the year. She suggested that the Auxiliary might assist the Red Cross in establishing emergency stations along the highways, or it might help in maintaining a list of registered donors to be called for immediate blood transfusions. Sending wheelchairs and hospital beds would be a great help. She also suggested that assistance in the development of the Braille program for the blind was needed.

There was no further business and the meeting was adjourned.

Mrs. R. B. Hartman,
Chairman of Publicity.

❦

Riverside County

The November meeting of the Woman's Auxiliary to the Riverside County Medical Society was held at the home of Mrs. C. N. Callander, with Mrs. Ratliff and Mrs. Wayland Coon as cohostesses.

Dr. and Mrs. Olsen of San Bernardino presented a program, descriptive of their recent European tour. This was illustrated with motion pictures. Mrs. Erwin Miller told of a trailer trip taken during the summer, and Mrs. Arthur W. Walker described vividly a visit she had made to the famous "quints."

The members seem most enthusiastic, and we expect to have an enjoyable and profitable year.

Katharine L. Wickman,
Corresponding Secretary.

❦

Sacramento County

About forty members of the Woman's Auxiliary to the Sacramento Society for Medical Improvement met at the home of Mrs. E. O. Brown on Tuesday evening, November 16, 1937.

Mrs. Donald R. Benson gave several vocal selections, accompanied by Mrs. Zue Geary Pease. Bridge occupied the remainder of the evening. A buffet supper was served.

Joining Mrs. Brown as hostesses were: Mesdames Albert Almada, Harry Baird, H. H. Beauchamp, W. H. Davis, Walter Hicks, Frank Krull, and D. L. McLean.

Mrs. Hugh Carmichael,
Chairman of Publicity.

❦

Santa Cruz County

Our first meeting—the organization meeting—of the Woman's Auxiliary to the Santa Cruz Medical Society was held at the home of Mrs. Alfred L. Phillips on Thursday, November 18, 1937.

Mrs. F. N. Scatena of Sacramento was guest speaker, and told us of the purposes and advantages of the Woman's Auxiliary.

The following officers were elected: Mrs. Alfred L. Phillips, president; Mrs. H. G. Watters, first vice-president; Mrs. N. R. Sullivan, second vice-president; Mrs. Gordon Bunney, corresponding secretary; Mrs. R. C. Alsberge, recording secretary; Mrs. W. E. Fehliman, treasurer. The directors are: Mesdames A. N. Nittler, to be in charge of programs; O. C. Marshall, to be in charge of the educational work that is to be planned; J. D. Fuller, who will be responsible for the work at the County Hospital; Mrs. D. S. Woodward will act as hostess.

Our regular meetings will be held on the second Monday of each month at the Rio Del Mar Country Club.

Mrs. R. C. Alsberge,
Chairman of Publicity.

❦

San Diego County

The Woman's Auxiliary to the County Medical Society was particularly favored on Tuesday, November 9, 1937, in being permitted to view a portion of Dr. George Huff's

colored films taken during his recent trip abroad. His illustrated lecture, entitled *Russian Medicine*, emphasized the very drab, delapidated, and rundown conditions of buildings and equipment in Russia.

Doctor Huff illustrated very clearly the low standard of living, the impoverished appearance of all people in the Russian streets, the lack of transportation facilities, the hopeless, dejected expressions of the old and young alike. He showed many street scenes in which automobiles were a rarity. Only officials possess cars in Russia. One doctor, who had rendered great service, was permitted an automobile with two chauffeurs. His use of the car usually included about thirty miles a week, every movement and call being carefully reported by the chauffeurs to the government. The doctor was not permitted to use the car for personal pleasure at any time.

Doctor Huff called attention to the need for doctors in Russia. The Soviet Government is now giving the medical students a salary while attending school.

He states that medical work in Russia is organized under various departments. The obstetrical department is headed by a most remarkable woman. Stalin recently sent an order to her, stating: "Eliminate venereal diseases." This was a large order, but the doctor ordered treatment for every infected person, and a legal statute has made it a criminal offense, punishable by not less than eight years in prison, for any person to transmit the disease. Prostitutes are examined every two weeks. Venereal diseases have not been eliminated, but great material progress has been made.

The equipment of all hospitals in Russia is extremely poor. The nurses are poorly dressed, with no stockings whatever. The rooms look bare and badly in need of repair.

However, in the field of obstetrics, Russia has made some remarkable progress. In other countries of Europe, midwives deliver many of the babies, but in Russia it is a law that all babies must be born in the hospital, and doctors are legally responsible for getting their patients to the hospital in time for delivery. The mothers are cared for and given pay during pregnancy and for a certain period after the birth of the child.

After visiting clinics all over Europe, Doctor Huff states that he believes America to be far ahead of all European countries in the field of medicine.

On December 14, Mrs. E. A. Blondin presented a book review to the Auxiliary.

On November 20, the annual dinner dance of the Auxiliary was enjoyed at the U. S. Grant Hotel in the Plata Real. It proved to be a most enjoyable occasion.

❋

San Francisco County

Honoring our state president, Mrs. Hobart Rogers, members of the Woman's Auxiliary to the San Francisco County Medical Society and guests gathered at a formal tea on Monday, November 29, 1937, at headquarters, 2180 Washington Street.

Presiding at the tea table were Mesdames Thomas Gibson and Julius Sherman, assisted by Mesdames J. V. Leonard and Lewis Michelson. Among the state officers who attended were Mesdames Harry C. Hund, Harold Trimble, and Charles C. Hall. Auxiliary presidents of neighboring counties were Mesdames A. A. Alexander of Alameda and Thomas Gocher of Marin.

Decorations for the tea table and rooms, in autumn foliage, fruits and vegetables, were beautifully arranged by Mrs. John D. Humber. A travel film of Mexico was shown at 2:30, preceding the tea.

Mrs. A. S. Musante, Chairman of Arrangements, was assisted by Mesdames George H. Becker, Anthony B. Diepenbrock, Howard B. Dixon, Arno G. Folte, John D. Humber, Otto Laist, Edmund J. Morrissey, William W. Newman, Harry R. Oliver, Frank Rodin, and Stuart C. Way. Members of the receiving line were: Mesdames Hobart Rogers, Fred H. Zumwalt, A. S. Musante, Harry C. Hund, William Sargent, and Thomas J. Clark, Jr. Our president, Mrs. Hans Barkan, was absent on account of illness.

Mrs. Rogers made an official visit to the Auxiliary at the regular meeting on November 16, at which time she gave a most inspiring talk. The purposes of our organization were clearly outlined, and the importance of the membership supporting the county, state, and national auxiliaries emphasized.

As guest speaker for the November meeting, Dr. Harold K. Faber delivered an interesting address on the *Recent Advances in Our Knowledge of the Treatment of Infantile Paralysis*. For the general meeting on Tuesday, January 18, Dr. Mary H. Layman will honor the Auxiliary with a discussion on the *Effect of Motion Pictures on Children*.

Plans are being formed for an Auxiliary dinner in February for members and their husbands. Mrs. Thomas Gibson and Mrs. George H. Becker will be chairmen of arrangements.

Mrs. Harry R. Oliver,
Chairman of Publicity.

Basle Nomenclature in Anatomy.—The BNA (Basle nomina anatomica) is the product of the Commission on Nomenclature appointed by the Anatomical Society in 1889. Its report (the BNA) was accepted in 1895 at a meeting in Basle, Switzerland.

This society was international; in 1895 it had 145 German members and 129 members from other nations. The chairman of the commission was Prof. W. Krause of Berlin; the members included Prof. G. D. Thane of London, and representatives of several other countries were invited to join it. They were among the ablest anatomists of that time.

The need for it appeared in the multiplication of terms. More than 30,000 were in the literature for 4,500 structures. Wilder, Gould and Gage in America, Henle in Germany, and the anatomic societies of Germany, Britain and America had urged the necessity of simplification.

The commission served without pay. The cost of correspondence and mimeographing was about $3,000; it was defrayed by scientific academies of Germany and Austria Hungary and by the Anatomical Society.

The plan included only names of descriptive gross human anatomic structures. Personal names were omitted except as some few had become universally adopted and firmly established as to make their omission impossible—these were added in brackets. The governing principles were as follows:

1. Each part shall have only one name.
2. It shall be in Latin, philologically correct. (Most names were in Latin form anyway and Latin is the only international language.)
3. It shall be short and simple.
4. It need not be descriptive nor speculative.
5. Related terms shall be similar.
6. Adjectives shall, in general, be arranged as opposites, as major-minor; superficialis-profundus.

More minute terms used in the medical specialties were omitted.

The work was admirably done. More than five-sixths of names previously used locally were abandoned—they were not necessary. The arrangement of terms indicated the normal structure—branches of vessels, nerves and others. The use of these names in the atlases of Spalteholz, Toldt, and Sobotta and in the textbooks of all countries led to its adoption almost universally, to the great advantage of medical sciences and of medical students.

The International Association of Anatomists, established later, has continued the revision. It has now a Commission on Nomenclature, including several American members; Professor Jackson of Minnesota is chairman of the American section. The commission has suggested a few changes and is now considering others.

Types of Pneumococci in Sputum of Patients with Pneumonia.—Of the 192 strains from the sputum of patients with croupous or bronchial pneumonia out of 300 type-identified strains of pneumococci tabulated by Nissen, the predominating types were I, present in 35.9 per cent, VII in 10.4, III in 9.4, VI in 7.3, IV in 5.2, and VIII in 4.7 per cent. In rubiginous sputum from eighty-three patients, pneumococcus types I, VII, IV, and III were most frequent; type-specific agglutinins in the blood were established with rising and falling titer in the cases in which types I, IV, and VII appeared in the sputum.—*Ugeskrift for Laeger.*

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association, San Francisco, June 13–17, 1938. Olin West, M.D., 535 North Dearborn Street, Chicago, Secretary.

California Medical Association, Hotel Huntington, Pasadena, May 9–12, 1938. F. C. Warnshuis, M.D., 450 Sutter Street, San Francisco, Secretary.

* * *

American Academy of Orthopedic Surgeons, Los Angeles, January 16–20, 1938. Carl E. Badgley, M.D., 1313 East Ann Street, Ann Arbor, Michigan, Secretary.

Pacific Coast Surgical Association, Los Angeles, February 22–25, 1938. H. Glenn Bell, M.D., University of California Hospital, San Francisco, Secretary.

Medical Broadcasts*

Los Angeles County Medical Association.

The radio broadcast program for the Los Angeles County Medical Association for the month of January is as follows:

Saturday, January 1—Holiday (New Year's).

Thursday, January 6—KECA, 11:00 a. m., The Road to Health.

Saturday, January 8—KFI, 9:15 a. m., The Road to Health; KFAC, 11:00 a. m., Your Doctor and You.

Thursday, January 13—KECA, 11:00 a. m., The Road to Health.

Saturday, January 15—KFI, 9:15 a. m., The Road to Health; KFAC, 11:00 a. m., Your Doctor and You.

Thursday, January 20—KECA, 11:00 a. m., The Road to Health.

Saturday, January 22—KFI, 9:15 a. m., The Road to Health; KFAC, 11:00 a. m., Your Doctor and You.

Thursday, January 27—KECA, 11:00 a. m., The Road to Health.

Saturday, January 29—KFI, 9:15 a. m., The Road to Health; KFAC, 11:00 a. m., Your Doctor and You.

Decoration Bestowed upon Dr. J. C. Geiger.—The following letter refers to an honor recently bestowed upon Dr. J. C. Geiger, Director of Public Health, City and County of San Francisco:

(COPY)

CONSULADO DE CHILI

San Francisco, California,
December 6, 1937.

My dear Doctor Geiger:

It gives me great honor to inform you that I have just received a letter from the President of the Chilean Delegation to the Orient, the Honorable Senator Maximiano Errazuriz, in which he asked me to advise you that the Government of Chili has granted to you the decoration, "Cruz de Caballero de la Orden del Merito," for your good friendship and assistance to my country and for your excellent work in and outstanding contributions to public health.

The diploma and insignia will be sent in the near future.

As representative of Chili, I wish to extend to you my sincere congratulations for this public recognition by my Government.

Very sincerely,

(Signed) MARIO ILANES,
Consul of Chili.

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject) to CALIFORNIA AND WESTERN MEDICINE, 450 Sutter Street, San Francisco, for inclusion in this column.

Trichinosis.—An outbreak, involving twenty cases of trichinosis, was investigated during October by the State Board of Public Health. They were found on the route of a peddler who sells delicatessen meats. The source of infection was in improperly processed smoked ham, which came from a small establishment.

The American Board of Internal Medicine: Written Examination.—The American Board of Internal Medicine will hold its next written examination on Monday, February 14, 1938, in various centers of the United States and Canada.

The examination will consist of two sessions of three hours each, with the morning session held at nine o'clock and the afternoon session held at two o'clock.

The candidates who are successful in this written examination will be eligible to take the practical examination which will be held in San Francisco the Friday and Saturday prior to the opening of the annual session of the American Medical Association in June, 1938.

The final date for filing applications for this written examination is January 15, 1938, and all applications should be in the office of the chairman before that date.

For further particulars and application blanks, please address Walter L. Bierring, M.D., Chairman, American Board of Internal Medicine, Suite 1210, 406 Sixth Avenue, Des Moines, Iowa.

Los Angeles Heart Association.—The sixth annual symposium on heart disease was held in Los Angeles on December 16 and 17, 1937. The program is given below:

Thursday, December 16

8 p. m.

(Joint Meeting with Los Angeles Clinical and Pathological Society)

Social Aspects of Heart Disease—John C. Ruddock, M.D.

The Surgical Treatment of Hypertension—Arthur L. Bloomfield, M.D., and David A. Rytand, M.D.

(By Invitation)

Friday, December 17

Morning Session, 9:45 a. m.

Diuretics—William Paul Thompson, M.D.

The Heart in Relation to Asthma and Emphysema—J. J. Singer, M.D.

The Management of Children with Rheumatic Heart Disease—Louis E. Martin, M.D.

The Heart in Hyperthyroidism—Phillip Corr, M.D.

Digitalis—Norman F. Crane, M.D.

Influence of Improper Diets upon the Heart—William Boeck, M.D.

Friday, December 17

Afternoon Session, 2 p. m.

Cardiac Care after Decompensation—R. Manning Clarke, M.D.

Heart Disease in Relation to Anesthesia and Surgery—J. F. Anderson, M.D.

Roentgenographic Methods in Cardiovascular Diagnosis—Wilbur Bailey, M.D.

Pericarditis—A. M. Roberts, M.D.

The Cardiac Neuroses—Verne Mason, M.D.

Errors in Cardiac Diagnosis—Louis E. Viko, M.D.

(By Invitation)

Evening Session, 8 p. m.

President's Address—William H. Leake, M.D.

The Use of Electrical Amplification in the Interpretation and Analysis of Heart and Lung Sounds—Louis E. Viko, M.D.

(By Invitation)

Collections of electrocardiograms, roentgenograms, and pathological specimens will be exhibited during the Friday sessions. E. Richmond Ware, M.D., William H. Leake, M.D., Ernest M. Hall, M.D., John W. Budd, M.D.

Into the Medical Corps of the Navy: Examination for Entrance.—An examination of candidates for appointment as lieutenant (junior grade) in the Medical Corps of the Navy will be held at all naval hospitals in the United States and at the Naval Medical School, Washington, D. C., beginning May 16, 1938.

Candidates for admission must be between the ages of twenty-one and thirty-two years at time of appointment, graduates of Class "A" medical schools, and have completed an internship of one year in a hospital accredited for interns by the American Medical Association and the American College of Surgeons.

Those who are interested should write the Surgeon-General, United States Navy, Bureau of Medicine and Surgery, Navy Department, Washington, D. C., for further information in regard to the examination and the procedure to follow for them to appear before one of the examining boards.

American Public Health Association.—The officers of the American Public Health Association (address, 50 West Fiftieth Street, New York, N. Y.), announce that the sixty-seventh annual meeting will be held in Kansas City, Missouri, October 25-28, 1938.

Dr. Edwin Henry Schorer, Director of the Kansas City Health Department, has been appointed chairman of the local committee. He will be assisted by a large group of city and state officials and community leaders.

A long list of affiliated organizations meet habitually with the American Public Health Association. They include: The American Association of School Physicians; the Association of Women in Public Health; the Conference of State Laboratory Directors; the Conference of State Sanitary Engineers; the American Association of State Registration Executives; Delta Omega; and the International Society of Medical Health Officers.

The attendance at the sixty-seventh annual meeting will exceed three thousand professional public health workers from every state in the Union, Canada, Cuba, and Mexico.

Grant Gives Big Impetus to Cancer Work at the University of California.—The means for greatly increasing the production of radio-active substances for the treatment of cancer and other diseases, and greatly decreasing the cost of such substances, has been placed in the hands of the University of California through a grant of $30,000 by the National Advisory Cancer Council of Washington, D. C. The grant has been made directly to Dr. E. O. Lawrence, professor of physics and head of the University of California's Radiation Laboratory, and comes on the eve of the removal of the laboratory to new and larger quarters on the campus.

The grant, according to Doctor Lawrence, will be applied to increasing the output of the new cyclotron, which is to be installed in the new laboratory early next year. The present cyclotron has already produced some two hundred radio-active substances, such as radio-sodium, radio-phosphorus, and radio-iron, and these will be applied to medical problems in the new laboratory. The new cyclotron is accordingly being called the "medical cyclotron."

The Radiation Laboratory already has produced radio-active substances equal in temporary radio-activity to one gram of radium. These amounts have been found adequate for hospital experimental use and at the present time can be produced at a cost comparable with that of radium. As the cyclotron is in the very earliest stages of technical development, Doctor Lawrence expresses the belief that its efficiency can be greatly improved, and it can be made to produce the equivalent of ten grams or more of radium at a consequent reduction in cost of manufacture of the radio-active substances. The fund from the National Advisory Cancer Council was given Doctor Lawrence in order that the radio-active substances may be made more cheaply and more abundantly and that they may cover the greatest possible ground in biological experimentation and application. Perhaps the most important feature of the newly created substances is that they are nontoxic, and may be taken into the digestive tract or administered intravenously without harmful consequences. They also permit a close observation of their action on the blood and the body otherwise through the "tagging" of atomic content through radio-active properties.

Los Angeles Surgical Society.—The annual meeting of the Los Angeles Surgical Society was held on Friday and Saturday, December 10 and 11, 1937, with headquarters in the Los Angeles County Medical Association Building. The program of the meeting follows:

Friday, December 10

9 a. m.

Dry Surgical Clinic, Los Angeles County Hospital

John F. Erdmann, M.D., New York

Guest Speaker

Bone Malignancies—Paul E. McMaster, M.D.

Gastroscopic (Demonstration)—John F. Renshaw, M.D. (By invitation.)

12:30 p. m.

Luncheon—County Medical Building

1925 Wilshire Boulevard

2 p. m.

Some Important Points in Aseptic Intestinal Resection—Foster Collins, M.D.

Operative Treatment of Dislocated Peroneal Tendons (slides)—Ellis Jones, M.D.

Immediate Repair of Divided Nerves and Tendons of the Hand (motion picture)—John E. Kirkpatrick, M.D.

Hour-Glass Tumor of the Spinal Cord—Mark Glaser, M.D.

Volvulus of the Cecum—E. Eric Larson, M.D.

Cancer of the Rectum with Complications—William Daniel, M.D.

Some Cases of Bone Tumor— A. E. Gallant, M.D.

Recess Ten Minutes

Hemorrhagic Cysts of the Kidney—A. J. Scholl, M.D.

An Evaluation of Common Anesthetic Methods—Arthur E. Guedel, M.D. (By invitation.)

Treatment of Hemorrhoids by the Injection Method—William Kiger, M.D.

Chronic Subdural Hematoma as a Problem in the Differential Diagnosis of Intracranial Lesions—Leo J. Adelstein, M.D.

Acute Perforation of Gastrojejunal Ulcer—Harold Thompson, M.D.

Regional Ileitis—Joseph Jellen, M.D. (By invitation.)

Retrotracheal Intrathoracic Toxic Adenoma of the Thyroid—Verne C. Hunt, M.D.

Annual Dinner, 7 p. m.

Saturday, December 11

9 a. m.

Dry Surgical Clinic, Los Angeles County Hospital

John F. Erdmann, M.D.

Malignancies of the Lower Urinary Tract—H. C. Bumpus, M.D.

Demonstration of Peritoneoscope—John Ruddock, M.D. (By invitation.)

12:30 p. m.

Luncheon—County Medical Building

1925 Wilshire Boulevard

2 p. m.

A Critical Analysis of One Thousand Cases of Appendicitis—E. C. Moore, M.D.

Recent Advance in the Treatment of Head Injuries—Carl Rand, M.D.

Solitary Paratyphoid Lesion of the Large Bowel—Wayland Morrison, M.D.

Injection Treatment of Hernia—William Weber, M.D.

Fatalities in Hernia Injection—Clarence J. Berne, M.D.

A Ruptured Appendix That Spontaneously Drained Through the Internal Abdominal Ring and Down the Canal of Nuck—Burns Chaffee, M.D.

Treatment of Urinary Extravasation (with motion picture)—Carl Rusche, M.D.

Recess Ten Minutes

Carcino-Osteogenic Sarcoma of the Chest Wall with Five-Year Follow-Up (with slides)—Frank Breslin, M.D.

Treatment of Occlusive Vascular Diseases — Vernon Thompson, M.D. (By invitation.)

Surgery of the Elderly Patient—J. N. Nichols, M.D.

Postoperative Complications, 1234 Cases—L. A. Alesen, M.D.

The Problem of Testicular Malignancy—Franklin Farman, M.D.

The Administration of Sulfanilamid—Albert Bower, M.D. (By invitation).

Reconstruction of a Mutilated Face Resulting from Automobile Accident (motion picture)—Arthur E. Smith, M.D.

American Board of Obstetrics and Gynecology: Examinations.—The next examination (written and review of case histories) for Group B candidates who have filed applications will be held in various cities of the United States and Canada on Saturday, February 5, 1938.

The general oral, clinical and pathological examinations for all candidates (Groups A and B) will be conducted by the entire Board, meeting in San Francisco, on June 13 and 14, 1938, immediately prior to the meeting of the American Medical Association.

Applications for admission to the June, 1938 Group A examinations must be on an official application form and filed in the secretary's office before April 1, 1938.

For further information and application blanks, address Dr. Paul Titus, Secretary, 1015 Highland Building, Pittsburgh (6), Pennsylvania.

Poor Health and Worry Insignificant at State University.—Poor health, worry about self or family, failure to make friends, emotional upset and other factors that are usually held responsible for improper adjustment of the University student to his surroundings and his studies, appear to be comparatively insignificant at the University of California. Intensive studies of the adjustment problem, made by Dr. Merton E. Hill, director of admissions, on one thousand transfers from junior colleges, show that the problem is far less concerned with the personal make-up of the student, as it is with outside influences, such as the time taken for self-support, and insufficient funds.

But 1.1 per cent of the group examined found their studies and activities hindered by poor health. None could be found who lacked medical care. Worry about home or family interfered with the school work of but 1.3 per cent. Failure to make friends concerned only 0.6 per cent, while the lack of student activities concerned only 0.4 per cent.

Emotional upset, which is supposed to cause many young people to quit school, claimed but 2.4 per cent of the group examined. Slow reading habits hindered 4.0 per cent, while living arrangements affected the work of 3.6 per cent.

The college course which causes the most difficulty appears to be economics. Chemistry comes next, but such supposedly "tough" subjects as astronomy, bacteriology, and biochemistry proved a stumbling-block for less than ten students for each of these subjects, out of the 905 who were questioned concerning them. The proportions are made more even, however, by reason of the fact that there are a great many more students taking economics than the other subjects.

Annual Expenditures of California State Board of Public Health.—On page 174 of the "Formal Report on Factual Data" of the California Medical Economic Survey is printed a table (Appendix G-13) that does not indicate how funds are allocated. Each county receives from the State $3 per week per patient to aid counties in the care of tuberculous citizens, as given in the first column of the table below. The administration expense of the State Board of Health, as expended through funds allocated by the legislature, is given in the fourth column (Total Administrative Expense).

	Total Tuberculosis Subsidies Paid	Total Administrative Expense[1]	Total Administrative Expense[2]
1920-1921	$106,721.13	$244,158.11	$255,863.72
1921-1922	150,456.92	290,372.31	305,099.12
1922-1923	156,612.36	303,764.35	318,179.98
1923-1924	176,755.71	184,697.10	193,021.46
1924-1925	214,429.23	216,415.41	224,871.98
1925-1926	235,117.97	225,556.64	276,540.22
1926-1927	257,312.76	262,528.37	334,154.65
1927-1928	287,697.27	260,338.93	344,826.07
1928-1929	237,119.09	288,930.92	384,753.26
1929-1930	378,876.73	292,951.82	404,582.96
1930-1931	440,255.79	326,417.01	458,051.69
1931-1932	482,259.59	304,987.45	402,908.07
1932-1933	519,726.50	284,783.71	372,138.50
1933-1934	550,785.68	201,847.65	304,318.44
1934-1935	562,116.51	208,547.56	325,671.61
1935-1936	589,151.85	226,257.36	388,697.83
1936-1937	304,573.32	255,951.11	500,310.28

[1] Exclusive of subsidy and exclusive of self-supporting activities and of those without legislative appropriation.

[2] Exclusive of the subsidy and special funds, but inclusive of cannery inspection and nurses' registration.

Dental Conferences.—The dental staff of the Bureau of Child Hygiene of the California State Board of Public Health is now composed of three dentists and a dental hygienist. They have worked in eleven counties, holding forty-one conferences, have instructed 1,868 children on the care of the teeth, and have examined the teeth of 357 children. In addition, 565 dental operations have been performed on seventy-one children. These activities during the month of October were carried on in Trinity, Modoc, Lassen, Alpine, and Mono counties. During the month, dental unit Number One, a fully equipped trailer, was exhibited before the Twelfth District Dental Society at Alturas.

Epidemiology.—In the new handbook of public health bacteriology issued under the auspices of the San Francisco Department of Public Health, Dr. J. C. Geiger, Director of that department, contributes an introductory chapter on epidemiology which is of interest. He states:

"Two modern weapons of public health work are bacteriology and epidemiology. Many of our older and sometimes successful health officials regard them as synonymous. As a matter of fact, lemology or lemography, meaning the sum of human knowledge as to pestilence, was known long before the science of bacteriology came into existence. The term "epidemiology" and its corresponding branch of the science of medicine, public health, are comparatively more actively used today and oftentimes the application to suitable problems is quite misunderstood, accordingly. Where disease affects the individual, the problem becomes that of the physician. Should this disease be of a communicable nature, like influenza, the locality, the city, the state, the nation, or the world may be involved.

On the other hand, diseases that are not communicable, such as those of the heart, but which may have some definite and perhaps controllable feature that can be applied to the population as a whole, can well come within the scope of epidemiological study. Likewise, the effect of disease on groups selected by age, sex, environment, climatic changes, occupation, even emotional and religious factors, may play their part. Therefore, epidemiology is a science with many ramifications, giving graphic or word pictures of the occurrence, incidence, distribution, the infectivity, the virulence of the causative microbic or viric factor, and the seasonal or calendar periodicity, both present and past, of communicable diseases."

A Human Death from Rabies.—A veterinarian residing in Los Angeles County was called July 19, 1937, to treat a small dog for suspected arsenic poisoning. While administering an antidote to the dog, he was bitten on both thumbs. The dog's teeth sank into the nail on one thumb and it was necessary to pry the dog's jaws apart in order to release the thumb. The animal died the following day and the head was taken to a laboratory, where an examination for rabies proved positive. The Pasteur treatment was administered within twenty-four hours to the veterinarian, who had been bitten by the animal. Iodin or some other antiseptic had been used on both wounds, but there was a delay of twenty-four hours in the cauterization with fuming nitric acid, which is the only proper agent to use for the purpose.

The Pasteur treatment of fourteen doses was completed uneventfully. About October 12 or 13, approximately ten weeks after completing the treatment, the patient suffered from headache, pain in hand and arm, was unable to sleep. On the following days he became progressively worse, ate with difficulty, unable to swallow, suffered from spasms upon attempting to drink, became irrational, requiring restraint, and died October 18, 1937.

The antirabies serum was manufactured by a reliable firm and had been kept under proper refrigeration. It would seem probable that the cauterization was late and did not destroy the virus under the thumb-nail. The Pasteur treatment is ineffective in a very small proportion of cases, and there is a possibility that this case fell in such a group. At all events, this unfortunate disaster emphasizes the fact that rabies is epidemic in California and that similar cases, tragic as they are, must be expected to occur until such time as the disease in animals, particularly dogs, may be brought under control.

University Has Important Data on Child Growth.—The data obtained by the Institute of Child Welfare of the University of California on different aspects of growth and development of children, cannot be duplicated elsewhere in the world. The utilization of this data is expected to develop a considerable reorganization in the techniques of teacher training in this State.

These conclusions have been reached by Dr. Daniel A. Prescott, member of the education faculty of Rutgers University, who is completing a year's study of both child and adolescent training in the University of California, under a special fellowship of the General Education Board, New York. The Board, which is actually a foundation maintained by Rockefeller funds, supports a number of the research activities of the institute.

Doctor Prescott listed twenty-three studies made by the Institute in the ten years of its existence, many of which concern aspects of growth and development in the same individual. The data range from biochemical tests and sociological findings to playtime behavior and samples of art produced by children of various ages. Not only will these studies figure in future teacher training, but they have many implications for the curricula of the secondary schools, Doctor Prescott said.

"These studies concern the problem of what the educators should know about children if they are to deal with them effectively," Doctor Prescott said. "The proper handling of the energy output, moods and emotions and the amount of work the pupil should do in the schoolroom and at home, are vitally concerned with these studies. The relation of physical growth to the child's social status is given attention, also.

"The task undertaken by the institute is a tremendous one, calling for a great deal of research."

Fourth Annual Postgraduate Assembly: Alumni Association, College of Medical Evangelists.—On Sunday, December 5, 1937, the Alumni Association of the College of Medical Evangelists presented the following program:

Morning Session

9:00 a. m.—Newer Developments in the Treatment of Arthritis, Dr. Robert Alan Hicks, Clinical Associate and Director of Laboratories, The Wyatt Clinic, Tucson.

9:30 a. m.—Treatment of Compound Fractures, Dr. Walter Ehalt, Chief Assistant Boehler Fracture Clinic of Vienna and Lecturer American Medical Association of Vienna.

10:00 a. m.—Contact Dermatitis, Dr. Laurence R. Taussig, Assistant Clinical Professor of Dermatology, University of California School of Medicine, San Francisco.

10:30 a.m.—Pneumoperitoneum in the Treatment of Pulmonary Tuberculosis, Dr. Edward W. Hayes, Associate Professor of Tuberculosis, College of Medical Evangelists School of Medicine, Los Angeles.

Recess

11:15 a. m.—Abdominal Surgery in Children, Dr. Loren R. Chandler, Associate Professor of Surgery and Dean of Stanford University School of Medicine, San Francisco.

11:45 a. m.—Certain Intraspinal Lesions as a Cause of Sciatica, Dr. Howard C. Naffziger, Professor of Surgery, University of California School of Medicine, San Francisco.

12:15 p. m.—The Present Status of Convalescent Serum Therapy, Dr. Clarence M. Hyland, Pathologist, Children's Hospital, Hollywood.

Afternoon Session

1:45 p. m.—Some Things the General Practitioner Should Know About the Eye, Dr. William A. Boyce, Professor of Ophthalmology, College of Medical Evangelists School of Medicine, Los Angeles.

2:30 p. m.—Treatment of Superficial Malignancies, Dr. Henry J. Ullmann, Director, Department of Cancer Research, Santa Barbara Cottage Hospital, Santa Barbara.

3:00 p. m.—Management of Vomiting in Children, Dr. Clifford D. Sweet, Chairman of Section on Pediatrics of American Medical Association.

3:30 p.m.—X-ray Treatment of Chronic Inflammatory Processes, Dr. Frederick Rodenbaugh, Director of the Radiological Departments, Franklin and Mary's Help Hospitals, San Francisco.

Recess

4:15 p. m.—Food Poisoning, Dr. Jacob Geiger, Department of Health, City and County of San Francisco.

4:45 p.m.—Medicine and Social Security, Dr. Morris Fishbein, Editor of *The Journal of the American Medical Association.*

5:15 p.m.—Painful Feet, Dr. Ernst Freund, Associate Professor of Orthopedics, College of Medical Evangelists School of Medicine, Los Angeles.

Evening Session

7:00 p. m.—Consideration of Rectal Diseases in General Practice, Dr. Malcolm R. Hill, Associate Professor of Proctology, College of Medical Evangelists School of Medicine, Los Angeles.

7:30 p. m.—The Treatment of Angina Pectoris, Dr. William Paul Thompson, Assistant Professor of Medicine, College of Medical Evangelists School of Medicine, Los Angeles.

8:00 p.m.—Urology in Children, Dr. A. Elmer Belt, Associate Professor of Urology, College of Medical Evangelists School of Medicine, Los Angeles.

8:30 p.m.—Acute Mechanical Obstruction of the Bowel, Dr. William B. Holden, Professor of Clinical Surgery, University of Oregon School of Medicine, Portland, Oregon.

Press Clippings.—Some news clippings dealing with matters related to public health activities or medical practice follow:

Doctors Quit Hospital as "Politics" Hit

Visiting Staff of San Luis Obispo Institution Demands a Complete Reorganization

San Luis Obispo, Dec. 16.—Resignation of physicians, surgeons, and dentists in San Luis Obispo County from service on the visiting staff of the County General Hospital was in the hands of the Board of Supervisors today.

The alternative to the wholesale resignation was, according to the hospital's visiting staff, a complete reorganization of hospital management, removing it from "political control" and placing it in the hands of the staff.

Doctors, surgeons, and dentists continued their hospital work today, but it was generally admitted that the formal filing of the resignations had brought to a head a long-continued dispute over hospital management.

One regular and one resident physician in San Luis Obispo and one regular physician in Paso Robles were unaffected by the resignation. The members of the visiting staff who resigned have been assisting the regular physicians.

Meeting Monday

The next meeting of the Supervisors is set for Monday.

Pointing out in the letter, signed by E. D. Anderson, secretary of the visiting staff, and by every member of the County Medical and Dental Associations, that "we stand ready to give our services to the County Hospital, provided that institution is operated for genuinely indigent patients and free from political influence," the doctors charge that "many patients have been admitted regardless of ability to pay."

This, they assert, places an unfair burden upon the taxpayers, who bear the cost of maintaining the hospital.—*Los Angeles Examiner,* December 17, 1937.

* * *

Doctors, Dentists Boycott Hospital, Accuse Politicians

San Luis Obispo, Dec. 17. (UP).—The County Hospital was under "boycott" today by the entire San Luis Obispo County medical and dental professions.

Doctors and dentists informed the County Supervisors they would no longer act on the visiting staff. They termed the hospital a "political football," claiming that county officials' friends, well able to pay for services, are being treated free. The two groups demanded a special welfare department to examine the financial condition of all hospital applicants.—*Los Angeles Examiner.*

Three New Regents

Los Angeles can be proud of the high type of citizen represented by the three choices for members of the Board of Regents of the University of California, as named by Governor Merriam. The filling of all three vacancies from this section was to equalize the Board geographically.

Eleanor Banning Macfarland, as a member of one of the Southland's oldest and most influential families, the Bannings, is intimately familiar with the fundamental problems of higher education. She, herself, took special courses at the University of California. As secretary of the English-Speaking Union and an authority on League of Nations work, she has a broad outlook on social problems of the day.

Stuart O'Melveny as head of the Title Insurance and Trust Company has proved his business acumen and keen discernment. He is the son of Henry W. O'Melveny, the pioneer attorney, and is himself a native of Santa Monica. His training is expected to be invaluable in helping to meet economic problems of the University.

217452

Gratifying to this area, too, is the choice of young Fred Moyer Jordan, the first graduate of the University of California at Los Angeles to be named to the Board. Jordan is only twelve years out of college, but he has become widely popular in alumni circles. He is head of the U. C. L. A. Alumni Association at present.

The Governor is to be congratulated upon his choices. They are ably qualified to help guide the destinies of one of the world's greatest universities.—Editorial, *Los Angeles Times,* December 26, 1937.

Federal Control of Medicine Might Be Dangerous Plan

Federal control of medicine may have just been indorsed by 430 physicians in the East, but it is unlikely that it ever will be favored by a majority of the 164,000 other doctors who make up the profession in the United States.

Medical discovery and mechanical progress are the only two things that lift us above the level of the ancient races. In government and the arts we are no better than were the Greeks and Romans, perhaps not so good. And the willingness of modern people for war certainly is no advance from the age of stone or bronze.

Only in the conquest of disease have we exhibited any ascendant humanity or altruism. The discoveries of Harvey, Lister, Pasteur, and hundreds of other unsung heroes—and heroines—of medical research were highly individualistic.

Nationalization of medicine could only serve to dull personal effort and tangle a noble occupation in a maze of petty politics in which studious and sincere doctors would find themselves subordinated to less-meritorious handshakers. Nationalization, it might be said here, is merely the modern sugar-coated word for socialization—whether of medicine, railroads or electric power—and twenty-five years ago was branded Red Socialism.

With all doctors working for the Government, and dependent for advancement on political favor, the average citizen probably would have to call up the ward boss to get attention for a sick child in the middle of the night.

Soldiers are particularly aware of what happens under the regimentation of medicine. Army medical officers become unusually calloused to human ills.

It is only human nature. Every soldier on sick call is a suspected malingerer. Soldiers with pride will not report to the infirmary until they are ready to drop.

"Paint it with iodin and mark him 'Duty,' " is an Army sarcasm, purporting to be the usual order of the surgeon to the medical orderly, regardless of whether the applicant has appendicitis or a broken leg.

Attendants at governmental institutions, prisons especially, charge that an inmate must be at the point of death before he can get any treatment other than a dose of salts.

Those examples are possibly an indication of what civil medicine could become if a uniformed service reduced physicians—good and mediocre—to a common rank. Getting in line for attention at a medical clinic, even federal, or getting in line for anything—except a theater—is too European for the American taste.

Of course, federal control has more adherents than those 450 who recently endorsed it. Among this group were 125 from the remote country districts of the New England states. Doubtless, it is a struggle for a physician to maintain himself in thinly populated and impoverished areas. It might be possible for the Government to provide physicians so situated, East or West, with a subsidy, making up the difference between a fair income and what the doctor can collect from his patients, thus providing proper attention for the people of farms and villages.

People now living have seen more medical discoveries than were made in the preceding 2,300 years which spanned known medical history back to Hippocrates, the Greek father of medicine, whose oath to aid the sick without thought of self is still taken by every graduating surgeon today. Nearly all keep it.

Our present system, the trusted family physician with his recourse to specialists in emergency, could not be shackled without damaging the welfare of the people. Public medicine is necessary to a certain extent—but not to 100 per cent.

For instance, no Americans who can possibly pay, want machine-like and impersonal obstetrics for their families.

Perhaps, if many of us were as meticulous with the doctor's bill as we are with the rent and car payment, there wouldn't be any talk of federal control of medicine.—*Los Angeles News,* November 30, 1937.

* * *

Legislation Demanded

Washington.—W. G. Campbell, Food and Drug Administrator here, has demanded legislation empowering the Federal Government to prevent the marketing of dangerous drug mixtures, such as the sulfanilamide "elixir," before they have taken their deadly toll.

Supplementing his report on the activities of the Administration for the fiscal year ending June 30, 1937, he stated in an interview that the $200 fine for first offenses against the Food and Drug Act was "no deterrent at all" to a manufacturer.

Speaking specifically of the "elixir," responsible for scores of deaths throughout the United States because the sulfanilamide, hailed by doctors as a major medical advance, was mixed with diethylene glycol, a dangerous chemical, Mr. Campbell asserted that the manufacturer should have made it his business to learn that diethylene glycol was dangerous before he used it. He added that the Federal Government should have the power to see that drug manufacturers do not make "mistakes" like that one again.

Health Clinic Merger Urged

Consolidation of county and all municipal health organizations under one county-wide department of health was urged yesterday by Dr. Robert E. Plunkett of New York, nationally known health authority. He recently completed an exhaustive survey here in conjunction with the county's Bureau of Research.

Doctor Plunkett, who is general superintendent of tuberculosis hospitals for the State of New York, also recommended early construction of two 500-bed tuberculosis hospitals, with selection of patients to be under the direction of the County Health Commissioner.

Citing figures that tuberculosis mortality in the United States has fallen since 1900 from 202 persons per 100,000 population to fifty-five persons last year, Doctor Plunkett advised enlargement of clinic activities and unified nursing programs to maintain the advances.—*Los Angeles Examiner,* December 1, 1937.

* * *

Supervisors Urge New State Laws for Nonresident Relief

The Board of Supervisors today was on record as endorsing a drive seeking new state legislation which would extend relief to so-called "technical nonresidents" of Los Angeles County, following demands presented by the Workers' Alliance.

Three hundred members of the alliance jammed the board's assembly room yesterday to request an amendment of present state laws prohibiting relief for persons who have not been self-supporting in California for at least three years, one of them in the county where application for aid is made.

The board also ordered investigation of complaints against present administration policies of the county charities department after members of the workers' delegation voiced claims that hundreds of Los Angeles school children whose parents are on relief are suffering from malnutrition.—*Los Angeles Herald-Express,* December 7, 1937.

Rift Over Government Aid

New York, Dec. 1.—The split between the American Medical Association and the committee of 430 prominent physicians, of which Dr. Russell L. Cecil of New York Hospital is chairman, appeared appreciably widened yesterday, following a statement which Prof. John P. Peters of Yale University School of Medicine, handed out in reply to the attack the association's official journal made to the committee's four "principles" and nine "proposals" for changes in medical practice. Some of these would entail government support of certain aspects of materia medica.

The committee holds that "the health of the people is a direct concern of the government," whereas the American Medical Association view, voiced by its journal, is strongly against the proposals, holding that the government should not be permitted to influence, through money grants, medical practices or hospitalization.

Professor Peters, who is secretary of the committee, in a statement made public during the week-end, revealed for the first time that the program of his body had been presented to President Roosevelt by a small group of physicians and that the President had "listened graciously and sympathetically," but had made no commitments.

To Continue Campaign

Doctor Peters at the same time made it clear that his committee would continue its campaign to "liberalize" the American Medical Association and challenged the stand by the association's journal that no member of the association should support the committee's program. He denied that the association had rejected the committee's proposals, adding that should this happen, it would still be the "privilege" and, indeed, the "duty," of members of the committee to try by every reasonable means within their power to influence not only the governing body, but all the component societies and individual members to join them in a purpose they consider "good and just." . . .

Medic Alumni Will Banquet

More than 120 alumni of the medical school of the University of Southern California will gather tomorrow night

in the banquet room of the Los Angeles County Medical Association for their annual reunion.

Dr. H. B. Tebbetts, president of the alumni, will preside. Dr. Rufus B. von KleinSmid, president of the university, and Dr. Frank F. Barham, an alumnus, who is publisher of The Evening Herald and Express, will address the physicians.

Other Speakers

Dean Paul McKibbon of the Medical School, and Dr. George Kress, president of the Los Angeles County Medical Association, also will speak.

At the conclusion of the dinner, officers for the forthcoming year will be installed. Dr. Harold R. Witherbee, vice-president, will succeed Doctor Tebbetts. His place will be filled by Dr. Pierre Viole, present secretary-treasurer, who, in turn, will be succeeded by Dr. Anthony Lauber-sheimer.—*Los Angeles Examiner,* December 17, 1937.

Los Angeles Called No. 1 Quack Nest of United States

Up to State to Run Medical Charlatans Out of City, Dr. Morris Fishbein Declares

Los Angeles is America's No. 1 quack nest!

This was the declaration of Dr. Morris Fishbein, editor of the American Association Journal, yesterday when he addressed the fourth annual postgraduate assembly of the College of Medical Evangelists.

"It is high time state officials were driving the quacks out of business in Los Angeles," he said. "I have been in every city in the United States at least five times in the last two years, and I say without reservation that Los Angeles has more quacks than any other place in the country.

"This city is full of medical charlatans and numbo-jumbo practitioners of all kinds. It is up to the state of California to clean up the town!"

Ruin Many Lives

Doctor Fishbein declared medical quacks are ruining the lives of hundreds of persons every year.

"These fakirs with their lurid promises of cure-alls are bringing sorrow and tragedy to many of our citizens," he said. "I urge the men and women of the medical profession to join in the fight to end widespread quackery in Los Angeles."

Doctor Fishbein addressed one thousand physicians and surgeons in Paulson Hall of White Memorial Hospital.

Other speakers included Dr. Jacob Geiger of the San Francisco Department of Public Health, and Dr. Walter Ehalt, lecturer for the American Medical Association of Vienna.—*Los Angeles Examiner,* December 5, 1937.

Insulin Shock Saves Mind

Oklahoman's Mental Faculties Restored as Christmas Gift

Vinita (Okla.), Dec. 22. (AP).—A 29-year-old oil-field worker went home from the State Hospital today with a priceless Christmas gift—a clear, sound mind.

Doctors said he had been rescued from insanity by "shocks" of insulin.

Dr. Felix M. Adams, superintendent, explained that the patient, an inmate for five years, was the second dementia praecox cure out of an original group of eight started on the insulin treatment by the hospital last August.

Reaction Gratifies

"It is grand the way they react," he said. "They all improve physically at first.

"Two others, one a college graduate who majored in mathematics, the other a farm boy, could not answer questions coherently a few weeks ago. Now they organize their thoughts and express them lucidly. They are going home for a while. Though not quite normal, they may not have to come back.

"And this other young fellow who is going home for Christmas with his mother and sister, why, he's tickled to death, and as grateful. What a priceless Christmas gift for the family!"

Others to Get Care

A new group of twenty-five patients will be started on the insulin treatment soon. Even with the results so far, Doctor Adams believes a record for the insulin method has been set here. Previous experiments in Europe and the United States had been limited to dementia praecox cases of two years' duration.—*Los Angeles Times.*

California Clinics to Spread New Health Methods

San Francisco, Dec. 18.—To insure that the developments of medical science may be carried from one end of the state to the other as quickly as they issue from the clinics and laboratories of the central medical centers, the California Medical Association has launched a five-year plan of field demonstration and study clinics. Nine cities—Stockton, Fresno, Riverside, San Bernardino, San Diego, Santa Barbara, San Jose, Santa Rosa, and Sacramento—have been suggested for the first of the clinics, and other cities will be added as the plan develops.

The plan, which has been titled "A Five-Year Study Program for Graduates in Medicine," links the medical centers of the Universities of California, Stanford, and Southern California, and the College of Medical Evangelists in Los Angeles, in the effort to establish numerous other centers strategically, and thereby assure a simultaneous spread throughout the state of the very latest procedures and developments in the healing sciences. Under the plan physicians and surgeons in the remotest places, who have found it difficult to take advantage of the consultation facilities provided by the large centers, may now go to the nearest clinic center and take advantage of those facilities to the fullest degree.

The clinics will be conducted by faculty members from the four centers named. In addition, the committee in charge contemplates forming teams of clinicians who will conduct a series of conferences in key centers in northern California.

In its preliminary announcement the Association states that the plan has been devised to enable the practitioner in the field to remain abreast of scientific progress, and to apply to his practice the newer procedures without delay, no matter how far he may be from the originating source.

The field clinics are the outgrowth of a partial field demonstration plan tried out by the University of California Medical School two years ago.—*Los Angeles Herald-Express.*

Asserts Pacific Coast Smuggling of Dope Drops

Washington, Dec. 18. (AP). — Intensive war against smugglers, waged by the enforcement unit of the Customs Bureau, has virtually stopped importation of illegal narcotics on the Pacific Coast.

E. G. Shamhart, chief of the unit, said today no narcotics smuggled from the Orient had been seized on the west coast in months, while that which had been captured was found to have been smuggled through New York and shipped to coast peddlers.

Shamhart attributed the decrease of the smuggling on the Pacific to the expanded enforcement unit which circled the coasts and borders of the nation, with customs agents trained in the work of trapping smugglers. He said the ship strike on the West Coast and the war in the Far East had put the finishing touches to the criminals. . . .

LETTERS

Concerning American Red Cross: A letter of appreciation.

The American Red Cross
National Headquarters

Washington, D. C.,
December 1, 1937.

To the Editor:—Please allow me to express to you in behalf of our national officers our very sincere appreciation for the generous contribution of space which you gave to the American Red Cross in California and Western Medicine. It is only through the splendid coöperation which you and others give to us each November that we are enabled to extend a universal invitation to all Americans everywhere to participate in Red Cross work through individual memberships.

Cordially yours,
(Signed) Douglas Griesemer,
Director of Roll Call.

Concerning the California Heart Association.

California Heart Association
for the Study and Prevention of Heart Disease

San Francisco,
October 15, 1937.

To the Editor:—The California Heart Association is now pushing forward the program which has been carefully worked out by the leading medical authorities of the State. These activities will be of greatest importance and will have a direct effect upon every practicing physician in California.

This program correlates and enlarges the work which has been carried on for the last ten years by the Los Angeles Heart Association in Southern California and

the work of the San Francisco Heart Committee in the northern part of the State.

Dr. W. P. Shepard of San Francisco heads a committee of physicians, attorneys, and industrial leaders, who have addressed themselves to the problem of heart disease in industry. The answer to specific questions is being sought by four well-organized subcommittees.

Under the leadership of Dr. Wilton L. Halverson of Pasadena, detailed studies have been outlined to obtain all possible specific knowledge about rheumatic fever in California.

The Executive Committee of the Association has been working in conjunction with the California Medical Association's standing Committee on Postgraduate Activities for many months. Within a short time a five-year course of instruction in all branches of heart and circulatory diseases will be offered to all doctors of the State.

Continuing the work of past years, a two-day symposium on heart disease was held in San Francisco, November 17 and 18; and another in Los Angeles, December 2 and 3. Each year these meetings add notable contributions to our knowledge of heart and circulatory diseases.

The California Heart Association has made a promising beginning. Many very prominent laymen in the State have expressed their conviction that our objectives are worthy of support and they are demonstrating their support by subscribing to our organization. But to be successful we must have 100 per cent support of the medical profession.

Membership in the Association entitles one to receive the monthly publication, *Modern Concepts of Heart Disease,* valuable reports and data gathered by all committees, and to receive the benefits of all our proceedings. Dues are very nominal, being only $2 a year. Correspondence is invited.

45 Second Street. Very sincerely yours,
JOHN C. RUDDOCK,

Concerning rabies in City and County of San Francisco.

(COPY)

San Francisco,
December 20, 1937.

Subject: Possibility of Rabies in San Francisco in Animals and in Humans.

To the Editor:—It will be of interest to note that the last case of human rabies reported in San Francisco occurred in 1913, following an intensive outbreak in dogs in 1912. This particular occurrence is of interest to the writer personally, since the outbreak of rabies in California in 1912 brought him originally to California in the same year to establish a Pasteur Institute at the University of California.

There were reported in San Francisco in 1912, two hundred and eighty-two animals suffering from rabies, mainly dogs. The last reported rabies in dogs in San Francisco occurred in 1929. Within the last two weeks two animals (dogs) suffering from rabies have been reported from Daly City, practically on the border line of the City and County of San Francisco.

It will be of further interest to note that since 1920 there have been reported in the State of California 13,128 animals with rabies and fifty-two deaths in human beings from the same disease. The greatest number ever reported in any single year has occurred in the past year, 1937, namely, 2,062 cases of rabies in animals with two cases in human beings. Of course, it is definitely understood that rabies in human beings or animals is 100 per cent fatal, there being no known cure or treatment when the disease becomes manifest.

It is because of the close proximity of recent cases in Daly City that the above facts have been ascertained and that definite warning is given accordingly. This warning is of particular significance to the Society for the Prevention of Cruelty to Animals inasmuch as they have control of stray animals, especially dogs and cats which are the reservoir of the disease. The area in the City and County of San Francisco nearest Daly City is our present danger spot, and we are requesting the Society for the Prevention of Cruelty to Animals to concentrate on the capture of stray dogs in this vicinity. If any dog is known to have been bitten by another animal suffering from rabies it is best to destroy it, inasmuch as the incubation period may extend from two weeks to six months and perhaps longer. Moreover, the present immunication of dogs that have been exposed to the disease has not always proved a practical procedure. The immediate treatment of dog bite is the immediate use of fuming nitric acid cauterization of the bitten area, and the report of the occurrence to the Department of Public Health.

Office of Director of Public Health,
City and County of San Francisco.

Sincerely,
J. C. GEIGER, M.D.,
Director.

Concerning California Postgraduate Supplement.

South Bend, Indiana,
December 6, 1937.

Dear Doctor Warnshuis:

Thank you very much for the supplement to CALIFORNIA AND WESTERN MEDICINE, giving the five-year study program for graduates in medicine.

I am tremendously interested in the subject of "Postgraduate Education." I believe that the maintenance of high standards of medical service is of the very greatest importance to the future of medicine as against various schemes for socialization.

Please convey my congratulations to Chairman Ruddock and his Committee for a very good piece of work.

Sincerely yours,
(Signed) R. L. SENSENICH. M.D.*

Concerning botulism outbreak in Tucumcari, New Mexico.

OFFICE OF
DIRECTOR OF PUBLIC HEALTH
CITY AND COUNTY OF
SAN FRANCISCO

November 19, 1937.

To the Editor:—Relative to the news report of an outbreak of botulism in New Mexico, I am sending you copy of a telegram sent this day to the Health Officer, Tenth District, Portales, New Mexico.

Sincerely,
J. C. GEIGER, M.D.,
Director.

Director, Public Health.

Concerning leaflets by the Nursing Information Bureau.

New York, November 1, 1937.

Dear Editor:

Physicians more frequently, probably, than any other group of individuals, are consulted by young people who want to be nurses. Parents, too, who are concerned for their children's welfare, turn to their doctors for answers to such important questions as, "Is there a future in nursing for my child?" "Will she make a good nurse?" "What is the best nursing school for her to attend?"

The Nursing Information Bureau of the American Nurses' Association now has available two vocational pam-

* Doctor Sensenich is a member of the Board of Trustees of the American Medical Association.

phlets which should prove useful tools to physicians and others who are asked for this type of advice. They are designed for high school and college students interested in nursing, and discuss the opportunities within the profession, the meaning of "training," how to choose a nursing school, and the general admission requirements of nursing schools. Copies may be had on application to the American Nurses' Association, 50 West Fiftieth Street, New York City.

Sincerely yours,

MARY M. ROBERTS,
Director, Nursing Information Bureau.

Concerning appreciation for a talk on "Social Medicine."

(COPY)

WESTWOOD VILLAGE KIWANIS CLUB
Westwood Village, Los Angeles,
December 18, 1937.

Mr. S. K. Cochems,
Executive Secretary, Los Angeles
County Medical Association,
Los Angeles, California.
Dear Mr. Cochems:

In behalf of the Westwood Village Kiwanis Club, I want to take this opportunity to express to you their appreciation of the splendid talk which you gave before our Club under date of December 17, 1937. The subject which you chose, namely, "Social Medicine," was a very timely one and one which should be well followed out in order to protect the profession which you represent.

Personally, I only feel sorry that more of our big business enterprises are not equipping themselves with speakers to combat this present-day element which has been devastating our business and professional people for the past several years. However, as stated by you, that advising the communities and organizing to get people interested in this so-called social insurance should be handled through many businesses and organizations to get results. I know for one organization, namely, the Westwood Village Kiwanis Club, you will find them wholly in accord with your message.

I personally want to thank you for giving your valuable time in appearing before our Club, and I want to extend to you a personal invitation to visit our Club and partake of our fellowship at any time you happen to be in Westwood Village. With best wishes for a Merry Christmas and a Prosperous New Year,

Very truly yours,

CARL G. CHOLCHER,
President.

Concerning the Advisory Board for Medical Specialties.

New York, N. Y., November 4, 1937.

To the Editor:—The Advisory Board for Medical Specialties adopted the following resolution at its meeting in Atlantic City on June 6, 1937:

Resolved, That the President appoint four members of the Advisory Board for Medical Specialties with power to add to their number and to form a Commission on Graduate Medical Education to study the problems of graduate and postgraduate medical training, such a Commission to be comprised of representatives of the medical profession, the hospitals, the universities, the medical schools, and the licensing bodies.

In keeping with that action, may I report that a Commission on Graduate Medical Education has been created, the personnel of which is attached.

The Commission will undertake to mobilize current opinions as to how the problems in this field can best be solved and to formulate the educational principles involved in graduate and postgraduate medical training. It is hoped that standards of training can be drawn up which will be of help to the Council on Medical Education and Hospitals and other agencies concerned with the inspection and evaluation of the facilities needed. There would be no duplication of effort nor conflict with the Council and these other agencies. The results of the studies by the Commission should be of real assistance to the specialty boards, the medical profession, hospitals, medical schools, state boards of medical examiners, and other institutions and organizations concerned with this phase of American medicine.

630 W. 168th Street.

Sincerely yours,

WILLARD C. RAPPLEYE, M.D., *President.*

MEDICAL JURISPRUDENCE†

By Hartley F. Peart, Esq.
San Francisco

Responsibility of Physician for Acts of Nurse: Doctrine of Res Ipsa Loquitur in Cases of Treatment by Means of Infra-Red Rays

The District Court of Appeal for the Third Appellate District has just decided the case of *McCullough* vs. *Langer*, 91 Cal. App. Dec. 444, in which the facts were these: Plaintiff commenced action against a physician and a nurse employed by the physician for alleged improper use of an infra-red incandescent lamp which caused permanent injury to plaintiff's leg in the nature of a third-degree burn. A jury returned a verdict in favor of the nurse, but against the physician. Two physicians testified for the plaintiff that the third-degree burn was the result of submitting tender devitalized flesh of a bruised thigh to extreme heat from the infra-red light for too great a length of time. It further appeared from plaintiff's testimony that a compress was placed over plaintiff's bruised thigh and left undisturbed over the wound with the heat of the lamp applied thereto for more than four hours without any effort being made by the physician to ascertain the result of such treatment. Plaintiff introduced evidence to the effect that the lamp would generate 140 degrees of heat in one hour and that the maximum heat which should be applied to that wound, under the circumstances, was not to exceed 110 degrees Fahrenheit.

The defendant physician appealed from the judgment against him, and two of the reasons which he urged for reversal of the judgment were:

1. That the exoneration of the nurse from negligence exempted him from liability because the nurse actually administered the infra-red heat treatment, and

2. That the trial court erroneously applied the doctrine of *res ipsa loquitur*.

With respect to the first contention of the defendant physician the District Court of Appeal held that since the nurse was acting under the direction of the physician and not acting independently, the physician was liable not merely because he was the nurse's employer, but also because he was a joint participant in the act complained of by the plaintiff. The following portion of the Court's opinion indicates the tremendous legal responsibility placed upon physicians for the acts of nurses and other assistants:

> Under the circumstances of this case the nurse was presumed to attend the patient under the supervision and direction of her employer, Doctor Langer. As the *McInerney* case, *supra*, states, the employer "was therefore liable not merely under the rule of respondeat superior, *but rather as a joint participant in the acts complained of.*" (*Armstrong* vs. *Wallace*, 8 Cal. App. (2nd) 429, 439.) In the case last cited, this Court said:
>
> "The surgeon had the power and, therefore, the duty to direct the nurse to count the sponges as a part of his work in the opening and closing of plaintiff's abdomen and the putting in and taking out of sponges, and *it was his responsibility to see that such work was done.*"

In the present case it was the *duty* of the doctor in his treatment of the patient to see that the compress and lamp were used in such a manner as to prevent the application of excessive heat and a consequent burning of the flesh. The supervision of the doctor is shown by his personal visits to the room of the patient and by the inquiry of the nurse addressed to him an hour before the burn was discovered as to whether she should not then change the compress and lamp, to which he replied, "Leave them until after his evening meal." The appellant was, therefore, not relieved of liability because of the verdict favorable to his codefendant.

With respect to the defendant physician's second contention, namely, that the trial court erroneously instructed the jury that the doctrine of *res ipsa loquitur* applied to the case, the District Court of Appeal stated that *res ipsa loquitur* ("the thing speaks for itself") applies to cases involving the negligence of a physician in the use of x-ray pictures taken for the purpose of diagnosing an ailment and also in the manner of actually treating the disorder. The Court said that in the present case the plaintiff was burned in some way unknown to him and as a result of the treatment of his injury by the physician and the nurse in his employ. It occurred while he was under the influence of opiates, which prevented him from knowing just what caused the burn. The Court then held that, under such circumstances, the doctrine of *res ipsa loquitur* was applicable and that the burden was on the physician to show that the third-degree burns were not occasioned by his negligence.

Hence, the court held mere proof that he was burned while undergoing treatment through the use of an infra-red incandescent lamp was sufficient to sustain the plaintiff's case and to cast responsibility upon the physician. The physician then had the burden of convincing the jury that he was not at fault.

† Editor's Note.—This department of California and Western Medicine, containing copy submitted by Hartley F. Peart, Esq., will contain excerpts from and syllabi of recent decisions and analyses of legal points and procedures of interest to the profession.

SPECIAL ARTICLES

DR. PHILIP MILLS JONES (1870–1916)*

Philip Mills Jones, M.D., a member of the Board of Trustees of the Association, secretary of the Medical Society of the State of California, and editor of the "California State Journal of Medicine" died in San Francisco, November 27, 1916, from pneumonia.

He was born in Brooklyn, January 17, 1870, and after attending the Polytechnic Institute of Brooklyn, from which he was graduated in 1886, he entered the academic course in New York University and then took his course in medicine at the Long Island College Hospital, Brooklyn, and was graduated in 1891. After practicing in Brooklyn until 1900, he moved to California and became associated with the University of California, in the Department of Archeology. He took a prominent part in the reorganization of the Medical Society of the State of California in 1902 and since that time had been secretary of that constituent state association and editor of its official organ. In order to serve his state association more effectively, and because he had found difficulty in securing lawyers who appreciated the medical phases of legal questions, in October, 1916, Doctor Jones passed the necessary examinations and was admitted to the bar to practice as an attorney and counselor at law in all the courts in the State of California.

He represented his state association in the House of Delegates of the American Medical Association continuously from the session of 1903 to the session of 1908. At this latter session he was elected a member of the Board of Trustees of the American Medical Association and served in that capacity up to the time of his death. He was a member of the National Committee of One Hundred on

* Editor's Note.—In connection with comment made in this issue, concerning the late Philip M. Jones, founder-editor of the official journal of the California Medical Association, and because it has taken months to locate a photograph of Doctor Jones, the obituary notice which appeared in the *Journal of the American Medical Association* of December 2, 1916, is here reprinted for the information of present-day members, and as a contribution to the historical files of the California Medical Association. For editorial comment, see page 1.

PHILIP MILLS JONES, M. D.
1870-1916

Public Health and a Fellow of the American Academy of Medicine.

Besides possessing the ability to write in a brilliant and convincing style, Doctor Jones was an effective and forceful public speaker and devoted much time and energy to the propaganda for public-health measures throughout California and the other Pacific states.

For eight years Dr. Philip Mills Jones was a member of the Board of Trustees, in which position he worked faithfully, and was fearless in his stand for what he believed to be right and just. He was secretary of the Medical Society of the State of California and editor of its journal for fifteen years, and it was in these offices that his most effective work was done. Through his efforts the California profession developed one of the best organizations of any state—one that is doing splendid work—professionally, socially, and scientifically. He made the "California State Journal of Medicine" a publication of influence not only within its own territory, but also in other parts of the country. As editor of this journal, Doctor Jones was especially fearless in his attacks on fraud and quackery, whether it concerned the proprietary medicine evils or quackery as it related to the medical profession.

BASIC SCIENCE ACT*

Draft of Proposed Law

An Act to establish a state board of examiners in the basic sciences underlying the practice of the healing art, to provide for its organization and powers, to provide that certification by that board be a prerequisite to eligibility for examination for license to practice the healing art, and to define the healing art.

Note.—In some states the constitutions require that the title of an act express the purposes and contents of the act. The title set forth above will, it is believed, conform to such a requirement.

Be it enacted.

Note.—The enacting clause should follow the form customary in the state.

Section 1. *Basic Science Certificate Required.*—No person shall be permitted to take an examination for a license to practice the healing art or any branch thereof, or be granted any such license, unless he has presented to the board or officer empowered to issue such a license as the applicant seeks, a certificate of ability in anatomy, physiology, chemistry, bacteriology, and pathology (hereinafter referred to as the basic sciences), issued by the state board of examiners in the basic sciences.

Note.—The sciences named are those that may be fairly said to have the same implication, whether the practitioner proposes to practice nonsectarian medicine or to follow the dogma of some cult. Whatever may be said of separate licensing boards for the nonsectarian practitioner and the cultists, there seems to be no valid argument against a uniform examination in the basic sciences, particularly if the examination is conducted, as is here proposed, by persons who are not active practitioners of the healing art.

Section 2. *Healing Art Defined.*—For the purposes of this Act, the healing are includes any system, treatment, operation, diagnosis, prescription, or practice for the ascertainment, cure, relief, palliation, adjustment, or correction of any human disease, ailment, deformity, injury, or unhealthy or abnormal physical or mental condition.

Note.—This definition brings within its scope nonsectarian medicine, osteopathy, chiropractic, naturopathic, sanipractic, and other modes of healing. It is inclusive enough to cover dentists, nurses, chiropodists, pharmacists, optometrists, and others, but Section 17 excepts them from the operation of the Act.

Section 3. *Board of Examiners in the Basic Sciences Authorized.*—The Governor, within thirty days after this Act takes effect, shall appoint a state board of examiners in the basic sciences (hereinafter referred to as the board), consisting of five members. The members of said board shall be appointed one for one year, one for two years, one for three years, one for four years, and one for five years, from the dates of their respective appointments. On the expiration of the term of any member, the Governor shall fill the vacancy by appointment for a term of five years. On the death, resignation, or removal of any member, the Governor shall fill the vacancy by appointment for the unexpired portion of the term. Every member shall serve until his successor is appointed and qualified. The members of the board shall be selected because of their knowledge of the basic sciences aforesaid, and each member shall be a professor, or an assistant or associate professor, or an instructor on the faculty of the ———— or some other institution of learning in the State of ———— of equal rank. Each member shall have resided in ———— not less than one year next preceding his appointment. No member of the board shall be actively engaged in the practice of the healing art or of any branch thereof.

Note.—This section aims at the creation of an examining board in which, by reason of the overlapping of the terms of members, there will be a continuity of policy and administration. The section proposes to limit the appointment of members of the basic science board to members of the faculties of approved universities and colleges, if possible. There should be inserted at the appropriate place the name or names of such school or schools.

Section 4. *Organization of Board.*—The board shall organize as soon as practicable after its appointment. It shall have authority to elect officers, to adopt a seal, and to make such rules as it deems expedient to carry this Act into effect. The board shall keep a record of its proceedings, which shall be *prima facie* evidence of all matters contained therein. Every member shall receive ———— dollars per diem and actual expenses, when actively engaged in the discharge of his duties. The compensation of the members and the other expenses of the board shall be paid out of the fees received from applicants, but this is not to be construed as preventing appropriations to cover deficits. The treasurer of the board shall give such bond, running in favor of the State, as the State Treasurer may determine. The office of the board shall be in the state capital, and quarters for that office shall be assigned in the capitol building or some other building occupied by the state government.

Section 5. *Fees Payable by Applicants.*—The fee for examination by the board shall be ———— dollars. The fee for reëxamination within any twelve-month period shall be ———— dollars, but the fee for reëxamination after the expiration of twelve months shall be the same as the original fee. The fee for the issue of a certificate by authority of reciprocity, on the basis of qualifications as determined by the proper agency of some other state, territory, or the District of Columbia, shall be ———— dollars. All fees shall be paid to the board by the applicant when he files his application. The board shall pay all money received as fees into the state treasury, to be placed in a special fund to the credit of the board. The State Treasurer shall pay out of such fund all expenses incurred by the board, on vouchers signed by the president and the secretary of the board.

Section 6. *Examinations.*—The board shall conduct examinations at such times and places as it deems best. Every applicant, except as hereinafter provided, shall be examined

* Prepared by the Bureau of Legal Medicine and Legislation, American Medical Association, Chicago. Reprinted in California and Western Medicine for its suggestive value to members of the California Medical Association.

to determine his knowledge, ability, and skill in the basic sciences. The examinations shall be conducted in writing, but may be supplemented by oral examinations, and if practicable shall be supplemented by examinations in the laboratory, dissecting room, and dispensary, and at the bedside. If the applicant receives a credit of 75 per cent or more in each of the basic sciences, he shall be considered as having passed the examination. If the applicant receives less than 75 per cent in one subject and receives 75 per cent or more in each of the remaining subjects, he shall be allowed a reëxamination at the examination next ensuing, on application and the payment of the prescribed fee, and he shall be required to be reëxamined only in the subject in which he received a rating less than 75 per cent. If the applicant receives less than 75 per cent in more than one subject, he shall not be reëxamined unless he presents proof, satisfactory to the board, of additional study in the basic sciences sufficient to justify reëxamination.

Section 7. *Requirements for Certificate.*—No certificate shall be issued by the board unless the person applying for it submits evidence, satisfactory to the board, (1) that he is not less than twenty-one years old; (2) that he is a person of good moral character; (3) that before he began the study of the healing art he was graduated by a high school accredited by the [insert state accrediting agency] or a school of similar grade, or that he possesses educational qualifications equivalent to those required for graduation by such an accredited high school; and (4) that he has a comprehensive knowledge of the basic sciences as shown by his passing the examination given by the board, as by this Act required. This shall not be construed to prevent the issue of certificates under the provisions of Section 8 of this Act.

Note.—No evidence is required of the applicant of the extent and nature of his knowledge of the basic sciences. These are to be determined by the board of examiners in the basic sciences by examination. The professional examining board to which the applicant must subsequently apply for his examination for license to practice is to be at liberty, it is proposed by Section 18, to accept the findings of the state board of examiners in the basic sciences with respect to the proficiency of the applicant in those sciences, or to reëxamine the applicant in those sciences on its own account.

Section 8. *Reciprocity.*—The board may in its discretion waive the examination required by Section 7, when proof satisfactory to the board is submitted, showing (1) that the applicant has passed in another State an examination in the basic sciences either before a board of examiners in the basic sciences or before a state board authorized to issue licenses to practice the healing art; (2) that the requirements of that state are not less than those required by this Act as a condition precedent to the issue of a certificate; and (3) that the board of examiners in the basic sciences in that state grants like exemption from examination in the basic sciences to persons holding certificates from the state board of examiners in the basic sciences of ———— or holding licenses to practice the healing art according to the method or school that the applicant proposes to follow, issued after examination by the proper licensing board of ————.

Section 9. *Appeals.*—Any person aggrieved by any action of the board may appeal to the ———— court of the county in which the appellant has his residence. Such appeal shall be taken by serving on the secretary of the board a notice of appeal, stating the action from which the appeal is taken and, if the appeal is from an order of the board, stating such order or the part thereof from which the appeal is taken, and filing with the secretary of the board a bond in the sum of $500, conditioned for the payment of all costs of the appeal and all damages sustained by any person because of the appellant's failure to comply with the terms of the action or order of the board, if such action or order be held to be legal and valid. On the filing and approval of such bond, the action or order, or the part thereof appealed from, shall be stayed pending the final determination of the controversy. Immediately on the perfecting of such appeal the secretary of the board shall transmit to the clerk of the court of such county the notice of the appeal and the bond, and a certified copy of all proceedings of the board relating to the action or order from which the appeal is taken; and such cause shall thereupon stand for trial at the first regular term of the court thereafter.

Section 10. *Certificates and Licenses Void.*—Any basic science certificate and any license to practice the healing art or any branch thereof, issued contrary to this Act, is void. Any licensing board which has issued a license on the basis of a void basic science certificate shall revoke or cancel that license. The procedure for such revocation or cancellation shall be in accordance with the provisions of the Act under which such license was issued, authorizing the cancellation or revocation of licenses generally. The certificate issued to any person by the state board of examiners in the basic sciences shall be revoked automatically by the revocation of his license to practice the healing art or any branch thereof.

Section 11. *Practice Without Basic Science Certificate Forbidden.*—Any person who practices the healing art or any branch thereof without having obtained a valid certificate from the state board of examiners in the basic sciences, except as otherwise authorized by this Act, shall be fined not more than ———— dollars or imprisoned for not more than ————, or both, in the discretion of the court.

Note.—The exception referred to in this section is governed by Section 17 of this Act.

Section 12. *Fraudulent Certificates Forbidden.*—Any person who obtains or attempts to obtain a basic science certificate by dishonest or fraudulent means, or who forges, counterfeits, or fraudulently alters any such certificate, shall be fined not more than ———— dollars or imprisoned not more than ————, or both, in the discretion of the court.

Section 13. *Fraudulent Licenses Forbidden.*—Any person who obtains or attempts to obtain a license to practice the healing art or any branch thereof from any board or officer authorized to issue any such license, without presenting to said board or officer a valid certificate issued to the applicant by the state board of examiners in the basic sciences, as in this Act required, shall be fined not more than ———— dollars or imprisoned not more than ————, or both, in the discretion of the court.

Section 14. *Issue of Fraudulent Licenses Forbidden.*—Any person who knowingly issues or participates in the issue of a license to practice the healing art or any branch thereof (1) to any person who has not presented to the licensing board a valid certificate from the state board of examiners in the basic sciences or (2) to any person who has presented to such licensing board a certificate obtained from the state board of examiners in the basic sciences by dishonesty or fraud, or any forged or counterfeit certificate, shall be fined not more than ———— dollars or imprisoned not more than ————, or both, in the discretion of the court.

Section 15. *Fees Paid Unauthorized Practitioners Recoverable.*—A person who has paid money or anything of value to a person not authorized to practice the healing art or any branch thereof, as compensation for services rendered in the practice of the healing art or any branch thereof, when the payor did not know at the time of payment that the payee was neither the holder of a certificate issued by the state board of examiners in the basic sciences nor authorized to practice without such a certificate, may recover such money or the value of the thing paid, by an action at law instituted within two years from the date of payment.

Section 16. *Enforcement.* — The state board of examiners in the basic sciences and the several boards authorized to issue licenses to practice the healing art and branches thereof shall investigate every supposed violation of this Act coming within the scope of the authority of such boards respectively, and report to the proper ———— attorney all cases that in the judgment of the board warrant prosecution. Every police officer, sheriff, and peace officer shall investigate every supposed violation of this Act that comes to his notice or of which he has received complaint and apprehend and arrest all violators. It shall be the duty of the attorney-general and of the several ———— attorneys to prosecute violations of this Act.

Section 17. *Exceptions.*—This Act shall not be construed as applying to dentists, pharmacists, nurses, optometrists, and chiropodists, practicing within the limits of their respective callings; nor to persons licensed to practice the healing art or any branch thereof in ———— when this Act takes effect; nor to persons specifically permitted by law to practice without licenses, who practice each within the limits of the privilege thus granted to him.

SECTION 18. *Saving Clause.*—Nothing in this Act shall be construed as repealing any statutory provision in force at the time of its passage with reference to the requirements governing the issue of licenses to practice the healing art or any branch thereof or as in any way lessening such requirements. But any board authorized to issue licenses to practice the healing art or any branch thereof may in its discretion either accept certificates issued by the ———— board of examiners in the basic sciences in lieu of examining the certificants in such sciences or it may examine such certificants in such sciences. The unconstitutionality of any part of this Act shall not be construed as invalidating any other separable part of it.

SECTION 19. *Short Title.*—This Act may be cited as Basic Science Act, 19——.

SECTION 20. *Repeal.*—All Acts and parts of Acts contrary to the provisions of this Act or inconsistent therewith are hereby repealed.

DOUGLASS W. MONTGOMERY*

Doctor Kelly has very graciously accorded me the privilege of saying a few words concerning our friend and colleague who is with us here tonight.

Too often we turn to the pages of our *Bulletin* and read an epitaph of a colleague no longer with us. Happily, tonight, while he *is* with us, we pause a few moments in our busy lives to pay tribute to Douglass Montgomery.

He has not only reached that enviable milestone in medicine, of a half-century of practice, but has accomplished still more; he now approaches his fifty-second year of continuous practice in San Francisco, and has been a generous member of the San Francisco County Medical Society most of those years. The archives of the American Medical Association reveal that only one physician in many thousands ever remains in active practice fifty years.

To get Doctor Montgomery to talk about himself is most difficult, as even there one encounters that Scotch trait of a bit of hesitancy in giving something away, including facts about himself. But having observed him occasionally for twenty years, I've garnered a few facts of interest to us. Canadian born, in 1859, of Scotch and Welsh parents, he was graduated from Upper Canada College, then attended Toronto Medical School for three years, going to Columbia for his final year, where he was graduated in 1882. After some time as chief of staff with the famous Halstead and Bull in New York, he went to Europe. There followed a productive three years in Italy, Heidelberg, Wurzberg, Vienna, Switzerland, London, and finally Edinburgh.

Then strangely enough a war brought him to San Francisco—a war between two railroads. One May day in 1886, he was strolling along the streets of St. Paul, Minnesota. The only two railroads to the West were having a rate war—even then. Douglass saw a sign which read: "$17.00 to Sacramento, California." He blinked his eyes and looked again; naturally, to a Scotchman that was like waving a red flag at a bull. His hand being in his pocket at the time, all he had to do was draw out the money and he was aboard. Luckily, it was spring, and as the train rolled over the blooming desert, Douglass congratulated himself upon getting to God's country for $17 and he stayed. Thus since May, 1886, San Francisco has had his valued services, first as the initial professor of pathology in the Toland Medical College for about five years; since then as one of the deans of dermatology of the West.

Doctor Montgomery is certainly the antithesis of Osler's famous remark about "the uselessness of men above sixty years of age . . . in professional life. . . ." He is proof that nobody grows old by merely living a number of years. People only grow old by deserting their ideals, and his are still with him.

As he approaches his seventy-ninth year of life, he walks daily from Fillmore and Vallejo streets to his office down town. He is in his office at ten in the morning and leaves late in the afternoon. His step is brisk, his carriage erect, and his energy remarkable.

For many years I've watched him in what would be our spare moments. On the automobile ferry, on a country hillside, in his office between patients, and in his home, I've seen him slyly withdraw a small volume in Greek, where an hour of counsel with one of the old masters would be had. And when one turns to literature for observations upon old age, one finds that it is the trend of the times to eulogize youth, and one quickly turns back to these very philosophers the doctor has never deserted. May I remind him of Cicero's words: "The fruit of old age is the memory of abundant blessings previously acquired." And again he wrote: "It is in the old men that reason and judgment are found, and had it not been for old men, no state would have existed at all."

Our own Oliver Wendell Holmes remarked that "to be seventy years young is sometimes far more cheerful and hopeful than to be forty years old."

I'm going to plagiarize from another author because I feel it is applicable to our guest tonight. In 1902, Sir William Osler wrote a tribute to the famous Alfred Stille; from that address I pluck the following: "Take the list of fellows of our Society, look over the names and dates of graduation of the practitioners of this city, and the men above seventy years of age form, indeed, a small remnant. All the more reason that we should cherish and reverence them. I only knew . . . after his seventieth birthday . . . the keenness of his mind on all questions relating to medicine. He had none of those unpleasant senile vagaries, the chief characteristic of which is an intense passion for opposition for everything that is new. He had that delightful equanimity and serenity of mind which is one of the most blessed accomplishments of old age. He had none of the irritating features of the old doctor who, having crawled out of the stream about his fortieth year, sits on the bank, croaking of misfortunes to come, and with less truth than tongue, lamenting the days that have gone and the men of the past."

I know of no one who has more thoroughly enjoyed the advance of the world than Douglass Montgomery. Last August 3, on his seventy-eighth birthday, he was merrily ensconced in a single motor plane with a Chinese pilot, flying up the Yangtze River of China, with his loyal wife and constant companion. The two of them made the round trip to China on the *Clipper* and, besides, went inland on rather doubtful planes.

His willingness to change to the new is best evidenced by what he told me last week. After being a Republican for seventy-eight years, and as well believing in a balanced diet and plenty of sleep, he discovered that Vice-President Garner goes to bed right after supper. Just a slight push and he'll be a Democrat. And as a modern story teller, he's a match for Tom Kelly, Junius Harris, or Morris Fishbein, any day in the week.

Doctor Montgomery, we're going to ask you to give us the secret of this fruitful life. Is it merely balanced diet and plenty of sleep; is it the hours of philosophizing you've had with ancient Greece and Rome; or is it the fact, being a dermatologist, you have taken advantage of the scientific fact that the skin of woman emits wavelengths of 9,440 millimicrons and thereby received some transmutation of energy? In other words, we want to know how one can remain in a skin game for fifty-six years and get away with it so well.

Whatever the reason be, we pause tonight to pay you tribute for your accomplishment. With that in mind, we have prepared a resolution which Doctor Kelly will submit to a vote here this evening. The following resolution will be duly engraved and presented to you as a constant reminder in the years to come, of the words of the Roman poet, Ovid, that "Time is generally the best medicine."

HAROLD M. F. BEHNEMAN.

* * *

RESOLUTION

WHEREAS, Our friend and colleague, Douglass W. Montgomery, has not only continuously and successfully practiced medicine in this city for over fifty years, but is still energetically pursuing that art according to the ethics and oath of Hippocrates; be it

Resolved, That *his* friends, the members of the San Francisco County Medical Society, herein acknowledge that unusual accomplishment, and offer to him their heartfelt felicitations and sincere good wishes for continued health and happiness.

* A Tribute: Given at a meeting of the San Francisco County Medical Association on December 14, 1937.

PACIFIC COAST ABORTION RING: CALIFORNIA SUPREME COURT DECISION*

Opinion follows:

89 Cal. App. Dec. 393—No. 3322.

Los Angeles—Arthur Crum, Judge.

Crim. No. 4116. In Bank. November 26, 1937

The People of the State of California, Plaintiff and Respondent, vs. R. L. Rankin, George E. Watts, John A. Creeth, J. O. Shinn, William A. Byrne, Valentine St. John, H. L. Houston, Bessie McCarthy, Grace Moore, Lillian Wilson, Jessie Radcliffe, James Beggs, Beatrice Bole, Jesse C. Ross, Violette Pellegrini, W. Norman Powers, and J. C. Perry, Defendants; William A. Byrne, Valentine St. John, James Beggs, and Jesse C. Ross, Defendants and Appellants.

For Appellant James Beggs—Clarence W. Hull; Sherman & Sherman.

For Appellant Valentine St. John—Charles A. Thomasset.

For Appellant William A. Byrne—R. E. Parsons, Jerome O. Hughes.

For Appellant Jesse C. Ross—Abe Richman.

For R. L. Rankin and William A. Byrne—Rosecrans & Emme, Bayard R. Rountree.

For Appellants—Anna Zacsek.

For Respondent—U. S. Webb, Attorney-General; Bayard Rhone, Deputy Attorney-General; Buron Fitts, District Attorney; Verne L. Ferguson, Deputy District Attorney.

This cause was taken over after decision in the District Court of Appeal of the Second Appellate District, Division Two, in order that we might more fully examine the record and certain issues raised upon the appeal. An examination of the evidence, covering 1,742 pages of the reporter's transcript, compels us to agree with the conclusion of the Appellate Court that as to the appellants Beggs, Ross, and St. John there is a dearth of corroborating evidence within the meaning of Section 1111 of the Penal Code as interpreted in *People* vs. *Kempley*, 205 Cal. 441, 271 Pac. 478, and *People* vs. *Davis*, 210 Cal. 540, 293 Pac. 32. However, we cannot accept the conclusion announced by that court with reference to the contention of the appellant Byrne directed against Count 7 of the indictment. This point will be discussed later.

Therefore, with such additional comment as shall hereinafter appear, we adopt the following portions of the opinion of Mr. Justice McComb as and for the decision of this court:

"Defendants were accused by the grand jury of the county of Los Angeles of the crime of conspiracy to violate Section 274 of the Penal Code, a felony, and in eight separate counts of having committed abortions. Defendants were tried jointly before a jury, whose verdicts were:

"1. Guilty:

"(Counts, 1. 2, 5, 7, and 9): R. L. Rankin, George E. Watts, J. O. Shinn, William A. Byrne, Grace Moore, Lillian Wilson, James Beggs, Jesse C. Ross.

"(Counts 1 and 5): John A. Creeth, Valentine St. John.

"(Counts, 1, 2, and 5): Violette Pellegrini.

"2. Not guilty:

"(All counts): Jessie Radcliffe, J. C. Perry.

"Defendants H. L. Houston, Bessie McCarthy, and Beatrice Bole were not apprehended, and defendant W. Norman Powers entered a plea of guilty to Count 1 of the indictment and testified on behalf of the State.

"Defendants James Beggs, William A. Byrne, R. L. Rankin, Jesse C. Ross, and Valentine St. John alone appeal from the judgments and orders denying their motions for a new trial.

"The appeal of defendant R. L. Rankin has heretofore been dismissed at his request.

Viewing the evidence most favorable to the prosecution (*People* vs. *Dukes*, 90 Cal. App. 657, 659), the facts in the instant case are:

"Defendants R. L. Rankin and George E .Watts owned, operated, and directed a series of offices, extending from Seattle, Washington, to San Diego, California, for the purpose of illegally performing abortions. The remaining defendants, with the exception of those who were acquitted by the jury, were employed by them in various capacities in connection with the conduct of their illegal business. In the course of their business, and in pursuance of their conspiracy, abortions were performed upon Gladys Duckworth, Peggy Nowell, and Josephine Peacock, as alleged in Counts 2, 5, and 9 of the indictment.

"A.

"Each appellant urges reversal of the judgments on the ground that there is no substantial corroboration of the testimony of his accomplices to show his participation in or connection with any of the crimes of which he was convicted.

"The law is settled in California that a conviction cannot be sustained upon the testimony of an accomplice, unless it be corroborated by other evidence which tends to connect defendant with the commission of the offense charged in the indictment (Section 1111, Penal Code), and it is equally clear that the corroborative evidence necessary to comply with this requirement must of itself, without the aid of the accomplice's testimony, connect or tend to connect defendant with the commission of the offense charged. (*People* vs. *Kempley*, 205 Cal. 441, 455; *People* vs. *Janssen*, 74 Cal. App. 402, 406; *People* vs. *Rokes*, 88 Cal. App. Dec. 317, 318.)

"Applying the foregoing rules to the instant case, we find with reference to the appellants Beggs, Ross, and St. John, that, after eliminating entirely the testimony of their accomplices, the record is completely devoid of any evidence even slight, which connects or tends to connect any of them with any of the crimes of which they were convicted. Since the judgments as to these appellants must be reversed for the foregoing reason, it is unnecessary for us to consider the other contentions which they have advanced.

"With reference to appellant William A. Byrne, we find a different situation. An examination of the record discloses that, after eliminating the testimony of his accomplices, there was substantial evidence considered in connection with such inferences as the jury may have reasonably drawn therefrom to connect him with the commission of the offense charged, thus furnishing the necessary corroboration to the testimony of his accomplices. One example of such corroborative evidence is found in the testimony of Geraldine Gerding, secretary to the manager of the Ocean Center Building in Long Beach, who it is conceded was not an accomplice, to the effect that appellant Byrne, about July 29, 1936, paid rent for rooms used by some of his coconspirators in that city for the purpose of performing abortions. There is ample evidence of a similar nature; however, since no useful purpose would be subserved by setting the same forth *in extenso*, we refrain from further discussion of it. (*Thatch* vs. *Livingston*, 13 Cal. App. [2d] 202, 56 Pac. [2d] 549; *Koberle* vs. *Hotchkiss*, 8 Cal. App. [2d] 634, 48 Pac. [2d] 104; *Leavens* vs. *Pinkham & McKevitt*, 164 Cal. 242, 245, 128 Pac. 399.)

"B

"Appellant Byrne relies for reversal of the judgments upon these additional propositions:

"First: Count 7 of the indictment did not charge a public offense.

"Second: Section 274 of the Penal Code is unconstitutional in that it fails to inform a person charged there-

December 10, 1937.

Re: *People vs. R. L. Rankin, et al.* (Pacific Coast Abortion Ring).

To the Editor:—We enclose herewith galley proof of the California Supreme Court decision in the case of *People* vs. *Rankin*, wherein you will note that new trials have been granted Drs. James Beggs, Jesse C. Ross, and Valentine St. John. You will also note that the State Supreme Court sustained the Los Angeles Superior Court conviction of William A. Byrne, former Assistant Special Agent of the Board of Medical Examiners.

We believe that the decision is of sufficient importance to warrant publication in the next issue of CALIFORNIA AND WESTERN MEDICINE.

Would appreciate return of galley proof when same has served your purpose.

With kindest personal regards, believe me

Very truly yours,
(Signed) C. B. PINKHAM, M.D.,
Secretary-Treasurer.

under with reasonable certainty as to what acts or actions are prohibited by it. . . .

"Appellant Byrne's final proposition is untenable. His entire argument is directed to the point that the words 'procure the miscarriage of such woman' do not convey a definite and certain meaning. 'Miscarriage' is thus defined in Bouvier's Law Dictionary, Volume 2, page 2221:

" 'The expulsion of the ovum or embryo from the uterus within the first six weeks after conception. Between that time, and before the expiration of the sixth month, when the child may possibly live, it is termed abortion. When the delivery takes place soon after the sixth month, it is denominated premature labor. But the criminal act of destroying the fetus at any time before birth is termed, in law, procuring miscarriage.'

"An almost identical definition will be found in Cyclopedic Law Dictionary, page 662, and substantially the same definition is given in each of the modern dictionaries of the English language. It is, therefore, evident that the phrase as used in the statute was sufficiently explicit to inform persons of common intelligence and understanding of the acts which were prohibited."

Even if we concede for present purposes that Count 7 of the indictment, as urged by the appellant Byrne, is deficient because of its failure to charge the aborting of a "pregnant" woman, we are of the opinion that no prejudice resulted therefrom, inasmuch as the evidence adduced upon the trial established the pregnancy of the woman involved. Therefore, under Section 4½ of Article 6 of the Constitution the assumed defect is insufficient to warrant a reversal of the judgment. (*People* vs. *Bonfanti*, 40 Cal. App. 614, 181 Pac. 80; *People* vs. *Buttulia*, 70 Cal. App. 444, 233 Pac. 401.) In the *Bonfanti* case, *supra*, the defendant was charged with assault with intent to commit rape, but the information failed to allege, as specified in Section 261 of the Penal Code, that the woman whom the defendant had assaulted was not his wife. The evidence, however, definitely indicated that she was not his wife. Under the circumstances, it was held that the defect in the information was not prejudicial in the light of Section 4½, *supra*. The reasoning of that case is applicable here, and the contention of the appellant Byrne with respect to Count 7 of the indictment does not call for a reversal of the judgment thereon.

The judgment and orders denying the motions for new trial relative to the appellants James Beggs, Jesse C. Ross and Valentine St. John are and each is reversed, and a new trial is ordered.

The judgments and orders relative to William A. Byrne on Counts 1, 2, 5, 7, and 9 are and each is affirmed.

WASTE, C. J.

We concur: Houser, J., Shenk, J., Curtis, J., Edmonds, J., Seawell, J.

MEDICAL CLINICS PLAN: PUBLIC HEALTH EXHIBITS

Golden Gate International Exposition: San Francisco

In the huge Hall of Science at the 1939 Golden Gate International Exposition, thirty of America's leading research laboratories will tell the story of the remarkable recent progress which has been made in the prevention and treatment of disease.

Led by such world-famous institutions as the Mayo Clinic, the Jackson Clinic, the American Medical Association, and the American Society for the Control of Cancer, these laboratories will present a dramatic picture of the latest advances in medicine and its related fields. The exhibit plans will also have the coöperation of the country's leading universities, notably the University of California, Stanford University, the California Institute of Technology, University of Southern California, Harvard University, University of Oregon, and the University of Washington.

According to Milton Silverman, Director of the Hall of Science for the $50,000,000 World's Fair of the West, these exhibits will place the major emphasis on the prevention of disease rather than its treatment. Following a 9000-mile trip to the outstanding laboratories and clinics of the United States, Silverman reports that amazing exhibits are being planned to illustrate the tremendous strides which are being made in research and disease prevention.

Reservations for space in the Hall of Science have already been made by the Mayo Clinic of Rochester, Minnesota, and plans are under way for a complete research exhibit at the Fair under the direction of Dr. Charles Mayo, Dr. Donald Balfour, who is now active head of the Mayo Clinic, and Dr. Walter Alvarez, internationally famous physiologist.

Supervised by Doctor Alvarez, a new and improved model of the transparent man will be shown, particularly emphasizing the digestive apparatus of the human being. From the extensive scientific museum at Rochester will come many astonishing displays built for use at the Exposition. Other material especially prepared for the Fair, will show the remarkable technique which has been attained in plastic surgery. Displays showing the prevention and treatment of appendicitis have also been promised, and educational exhibits pertaining to diabetes, asthma and experimental dentisry are also contemplated. The Mayo Clinic will also participate in the cancer exhibit and the embryological exhibit.

The Jackson Clinic of Madison, Wisconsin, will center all its efforts on one central exhibit, the story of the thyroid gland. This display will show the normal activity of the gland and how it secretes the amazing and highly powerful hormone, thyroxin. Special consideration will be given to the remarkable achievement in preventing both physical and mental destruction through the impairment of this gland and the importance of iodin in keeping the gland functioning. Attention will also be focused on the so-called goiter belt stretching across northern United States, and dynamic exhibits will demonstrate the prevention of goiter and cretinism. Dr. Arnold Jackson, head of the clinic, will personally direct these activities at the San Francisco Exposition.

Two Wisconsin schools planning to participate in the medical exhibit are the Marquette University and the University of Wisconsin. Dr. Eben J. Carey of Marquette, who was in charge of medical exhibits at the Century of Progress, is heading a group which is planning an outstanding exhibit on embryology, "How Life Begins."

At the University of Wisconsin an exhibit is being prepared to show the modern use of drugs and chemical to alleviate pain. In a coöperative exhibit, University of Wisconsin pharmacologists and anesthetists will collaborate with similar groups from the University of California in a demonstration of modern anesthesia.

An unusual cancer exhibit, which will illustrate the steps being taken to check this most dreaded of all diseases, will have the coöperation of the American College of Surgeons and other noted groups. Use of radium, x-ray, and surgical treatment will be demonstrated as well as modern preventive measures.

Other important subjects to be covered by the American College of Surgeons include the treatment of bone injury, particularly the new plastic bone surgery. Directing the American College of Surgeons' activities at the Exposition will be a committee composed of Dr. Howard Naffziger of the University of California, president-elect of the Association; Dr. Frank Lynch, also of the University of California, vice-president; Dr. Emile Holman of Stanford University; and Dr. Malcolm McEachern of Chicago.

The story of teeth and their connection with general health will be vividly portrayed in the Hall of Science by the exhibit of the American Dental Association. As a central feature of these booths a moving model will demonstrate in a novel way how teeth are formed and grow in the mouth. A series of illustrations will also show how apparently healthy teeth can decay and how many dental troubles can be prevented from spreading to other parts of the body, particularly the heart, kidneys, and bones. Of especial interest to the layman will be a portrayal of the history of dentistry from its earliest beginnings. The crude methods of the ancient man of brawn will be vividly contrasted with the technique of the skilled specialists of today.

Another phase of the Health and Science show will deal with the prevention of diseases transmitted from household pets and other animals to man, such as tuberculosis, rabies, and Malta fever. This section of the Exposition will be under the direction of the American Veterinary Medical Association. Prevention and treatment of disease in animals also will be included in this section of the Hall, which will be under the direction of Dr. C. M. Haring of the Veterinary Science Department of the University of California.

In still another section of the vast Hall of Science industrial chemical companies will show the contributions of modern chemistry in scientific nutrition with all its import to the health of man. Other displays by the chemical industry will show the development of synthetic plastics, compounds which are beginning to be of great importance in improving man's comfort and industrial efficiency.

From the viewpoint of the layman, the medical exhibits of the San Francisco Fair will show how the application of precautionary measures can help prevent the inception of disease and the spread of infection. Every field of medicine is being drafted to help carry out this ambitious program.

For additional information, address Golden Gate International Exposition, 585 Bush Street, San Francisco.

PROPOSED INITIATIVE: MEDICINE AND SURGERY*

Proposed Initiative Law: Sponsors Hoping to Place Same on 1938 State Election Ballot

The *Attorney-General has entitled and summarized the chief purposes of the proposed amendment and the points of such* as follows:

Medicine and Surgery—Initiative.—Defines "practice of medicine" as use or prescription of poisonous drugs or medicinal preparations in treating human ailments, and remedying results of violence of accident by other than orthopedic surgery, excluding from definition all other healing practices. Provides penalties for unnecessary major surgery and creates conclusive presumption that surgery unnecessary if diagnosis is erroneous or no pathology is found justifying operation. Creates conclusive presumption of unskillfulness if person operating has less than five hundred hours' academic surgical training or has taken part in less than fifty major operations. Requires prescriptions be written in English language.

* * *

The people of the State of California do enact as follows:

PUBLIC HEALTH LIABILITY ACT

An Act to protect the public health by providing terms and conditions upon which major surgery may be performed and upon which prescriptions for any substance for treatment of human beings may be issued and dispensed; providing liabilities for the advising of or the performing of unnecessary or unskillful major surgical operations on human beings; defining major surgery and minor surgery, and practice of medicine requiring reports following major surgical operations; repealing all acts or parts of acts in conflict herewith. Provides penalties for violation of Act.

Section 1. This Act *shall be known and cited as the "Public Health Liability Act."*

Sec. 2. It shall be *unlawful for any person to perform any unnecessary major surgical operation upon any human being* or to sever any tissue of a human being unnecessarily, or to advise or prescribe for any unnecessary major surgical operation or the unnecessary severance of any tissue of a human being.

Sec. 3. *An unnecessary major surgical operation* is conclusively presumed where no pathology is found to exist which would justify a major surgical operation as performed, or a major surgical operation performed in pursuance of a wrong diagnosis, or a major surgical operation performed from which the patient could not reasonably be expected to receive the relief of disorder upon which the operation was promised.

Sec. 4. It shall be *conclusively presumed that a major surgical operation was unskillfully performed* unless the person so performing the said operation has had at the time of performing the said operation not less than five hundred hours of training in the subject of major surgery in a duly chartered college of healing; or, who at the time of the adoption of this Act attended and took part in not less than fifty major surgical operations prior to adoption of this Act; or if from the results of the said operation it is proved that the person performing the said operation did not have the necessary skill or training requisite to perform such an operation.

Sec. 5. *Nothing in this Act shall be construed as justifying any person for the negligent performance of any major surgical operation* regardless of skill or training.

Sec. 6. *A wrong diagnosis* is hereby defined to be a wrong conclusion relative to a major surgical procedure, or a wrong conclusion respecting the nature or character of the patient's condition, or a wrong determination of the existing pathology in the patient.

Sec. 7. *The burden of proof of proper training,* experience, skill and diagnosis shall be upon the person performing the said operation as a matter peculiarly within the knowledge of the said person.

Sec. 8. *Before performing any major surgical operation,* the person advising, if he is not to personally perform the said operation, and in any case the person who is to perform the said operation shall sign a written diagnosis of the patient's condition and the necessary purpose of the proposed operation in detail and shall deliver a copy of the said diagnosis and purpose of the proposed operation to the patient or his designated representative. The said writing shall be fully descriptive, definite, and certain. Any waiver or modification of this provision shall be void.

Sec. 9. *Immediately following the performance of any major surgical operation,* and in not more than five days thereafter, the person performing the said operation shall forward all, and each and every part, of excised normal or pathological tissue removed from the patient in the said operation to the State Department of Public Health, together with a copy of the surgical record. It shall be the duty of the said State Department of Public Health to examine the said tissue and to make a full and complete laboratory and other indicated report of findings from the specimens and tissue received. The making of a false report, or the making of an incomplete report as required herein shall be a violation of the Act. The report herein required shall be delivered to the patient or any designated representative in not more than twenty days after receipt of the said tissue, and there shall be no charge for the said report beyond the actual cost thereof.

Sec. 10. The said *Department of Public Health shall retain the said tissue in proper state of preservation* for a period of three hundred days unless that at any time before disposal of the said tissue or specimens on written demand, it shall deliver the same to any laboratory designated by the patient or his authorized representative. The patient may have a professional representative present during the examination of the aforesaid tissue by the said Department of Public Health.

Sec. 11. *Provided, however, that where it appears that an emergency exists* in fact the provisions of Section 8 shall not need be complied with prior to the operation, but that the said diagnosis shall be filed within forty-eight hours after the said operation has been performed. An emergency is defined to be the result of a traumatism or a condition existing that could not normally be calculated upon. Provided further, that, where this emergency provision is proved to have been used as a subterfuge to avoid

* For further comment concerning this proposed law, the sponsors of which are seeking approval from Public Health Committees of Chambers of Commerce and other organizations, see in this issue, on page 5.

The copy of this Initiative came into our hands as the manuscripts for the January issue of CALIFORNIA AND WESTERN MEDICINE were going forward to the printer. For the information of California Medical Association members the letter which was received by members of the Public Health Committee of the Los Angeles Chamber of Commerce is printed below. In the text of the Initiative, the italics have been inserted by the Editor, to permit easier reference.† Letter to the committee members follows:

LOS ANGELES CHAMBER OF COMMERCE

Los Angeles, California,
December 16, 1937.

To All Members of the Public Health Committee,
Los Angeles Chamber of Commerce.
Dear Committee Member:

A special meeting of the Public Health Committee will be held at 12:15 p. m. on Wednesday, December 22, at the Los Angeles Chamber of Commerce, for the purpose of discussing the Public Health Liability Act, Initiative Petition No. 29.

Mr. Frank W. Walden has been invited to meet with the committee at this time, as well as a number of other interested individuals.

This is an important matter, and I hope that all committee members will be present.

Very sincerely yours,
LOS ANGELES CHAMBER OF COMMERCE.
Geo. H. Cecil,
Secretary, Public Health Committee.

† Later memo: On Wednesday, December 22, the Public Health Committee of the Los Angeles Chamber of Commerce voted to recommend nonapproval of this proposed initiative law.

any other provision of this Act, the liability and penal provisions of this Act may be doubled in the sound discretion of the court and within the provision of the law appertaining.

Sec. 12. *Major surgery is defined* as that form of surgery in which it is necessary to penetrate healthy tissue in order to reach morbid or diseased tissue. Morbid tissue shall be understood to include fractures or injured tissue due to traumatism.

Sec. 13. *Minor Surgery is defined* as that form of surgery in which it is not necessary to penetrate healthy tissue in order to reach morbid or diseased tissue. It shall be understood that penetration of healthy tissue when such penetration is limited to the subcutaneous shall be within minor surgery.

Sec. 14. The *practice of medicine is defined* to be the use or prescription of drugs or what are known as medicinal preparations for human beings and those things that are incidental thereto; and remedying as far as possible the results of violence and accident by other than orthopedic surgery, all other practices are declared not to be within the practice of medicine.

Sec. 15. The *term "drug" is defined* to mean any substance, vegetable, animal, or mineral, simple or compounded, in the composition of medicine or what are known as medicinal preparations.

Sec. 16. *"Medicine" or what are known as "medicinal preparations" is defined* to mean any drug or combination of drugs applied, prescribed, or to be used for the purpose of curing, mitigating, or alleviating physical or mental disease of human beings. The application, prescription or use of nonpoisonous substance, vegetable or animal, simple or compounded, shall not be construed as medicine or what are known as medicinal preparations, oils, liniments, or aromatics used for external purposes, shall not be construed to be medicine or what are known as medicinal preparations.

Sec. 17. *Every person who takes part in or assists,* in any manner whatsoever, in any unnecessary surgery as herein set forth, shall be equally liable as a principal, except that any nurse or student nurse having no knowledge of the lack of necessity of the said operation shall be relieved of all liability as herein provided; every hospital or institution, or hospital or institutional corporation, charitable or otherwise, which permits any unnecessary operation as herein defined, in its hospital or institution, shall be equally liable as a principal.

Sec. 18. *That every person, institution, hospital, institutional or hospital corporation,* violating any of the provisions of this Act *shall be civilly liable for the actual damages suffered and an additional sum of $500.*

Sec. 19. *It shall be unlawful for any person to issue a prescription* for any substance for any disease, deformity, or mental or physical condition of any human being, whether such substance shall be what are known as drugs or medicinal preparations or otherwise, *in other than the English language,* or to use or dispense any such prescription unless reduced to writing in the English language; or to issue or dispense any substance under a prescription which does not contain upon the container thereof a label setting forth a copy of the prescription in full, and if the said prescription be for what is known as a patent medicine, the label shall state "this prescription is for a patent medicine" and the name of the patent medicine. Nothing in this section shall be construed to prohibit the use of a language other than English, when made in addition to the English language and constituting a fair interpretation thereof.

Section 20. Any action under the provision of this Act shall be commenced within one year of the time the liability was incurred.

Sec. 21. *In the event that any person convicted under the provisions of this Act is licensed to practice any of the professions characterized as a healing art,* the board or boards of examiners of any such healing art shall suspend the license to practice of the person so convicted for not less than six months, nor more than two years. It shall be a violation of this Act for such person to practice during such suspension.

Sec. 22. *Any violation of the provisions of this Act shall constitute a misdemeanor and shall be punished by imprisonment in the County Jail for a period of not more than six months, or by a fine of not more than $500, or by both such fine and imprisonment.*

Sec. 23. All Acts or parts of Acts in conflict therewith are hereby repealed.

Sec. 24. Any section, subsection, sentence, clause or phrase of this Act for any reason held to be unconstitutional, such decision shall not affect the validity of the remaining portions of this Act. The people hereby declare that they would have passed this Act, and each section, subsection, sentence, clause or phrase thereof, irrespective of the fact that any one or more sections, subsections, sentence, clause or phrases may be declared unconstitutional.†

INFORMATION CONCERNING NEW LABORATORY LAW*

1. A *clinical laboratory* is any place or establishment where any tests, no matter how limited in variety, are made for the investigation of the existence or progress of disease.

2. A *technologist* is a person who directs a laboratory and who holds a license as a technologist.

3. A *technician* is a person who holds a license as technician and who works under the direction of a technologist or of a licensed physician and surgeon.

4. After January 1, 1938, no one may conduct a clinical laboratory unless he is either a technologist or a licensed physician and surgeon.

5. After January 1, 1938, no one may work in a clinical laboratory unless he is a technologist, a technician, or an apprentice.

6. A person may acquire a license as a technologist without examination, provided he has had five years' experience actually directing and at the same time working in clinical laboratories, all of which were completely equipped for, and doing work in all of the sciences of bacteriology, serology, biochemistry, parasitology and related subjects, the last year of which immediately preceding the passage of the Act must have been in California, and provided further that he makes application for the license before January 1, 1938.

7. A technologist's license may be secured by examination, further requirements being that he hold a bachelor's degree in one or more of the fundamental sciences pertaining to laboratory work, from a recognized institution and that he also possess five years' experience, one year of which has been as chief technician in a laboratory, all laboratories being of grade and standard acceptable to the Board of Public Health.

8. Certificates of licensure for clinical laboratory work of limited range will be issued without examination as provided in Section 4 of Chapter 804, to persons presenting evidence of experience in any phase of clinical laboratory work, totaling three years, had within the period of five years immediately preceding the effective date of the Act, one year of which shall have been in laboratories within the State of California. Such certificates will be issued one for each of the general divisions of the work, *i. e.,* bacteriology, serology, biochemistry, and hematology, and in special and particular instances may be issued for still more limited fields of activity, in which case the certificate will set forth particular tests that may be practiced.

The certificates issued under this provision will carry the statement that the license is issued without examination, under the provisions of Section 4 of the law. Graduates of a university recognized by the Board, who hold the A. B. degree, secured with a major in one of the medical sciences, will be credited with the first two years of the required experience, but one year's practical experience in an acceptable laboratory in California must be shown.

Application for technicians' licenses without examination must be made before January 1, 1938.

The fee for a technician's license without examination is one dollar, payable with application. The fee will be returned if the application is rejected.

9. Certificates will be issued to technicians by examination, each certificate entitling the holder to receive a license permitting him to engage in the work covered by the certificate.

† This proposed amendment does not expressly amend any existing law; therefore, the provisions are new provisions added to existing law.

* Chapter 804, California Statutes of 1937.

Besides separate certificates in bacteriology, serology, biochemistry, and parasitology, one all-inclusive certificate, called Senior Clinical Laboratory Technician, will be issued by examination, which certificate entitles its holder to be licensed to engage in all the work of a clinical laboratory.

10. All persons believing themselves eligible to receive any sort of license without examination should immediately write to the State Division of Laboratories, Berkeley, requesting forms on which to apply for the license. Owing to the short time remaining before January 1, where it appears impossible to complete the necessary investigation preliminary to the issuance of a license, a temporary license revocable at any time will be issued.

Such temporary licenses must be replaced by permanent licenses before July 1, 1938.

11. Fees. (Rule 14 of regulations.)

(a) *Clinical Laboratory Technologists.*—The fee for the certificate of license as clinical laboratory technologist shall be $10, payable with application for license without examination. If the applicant is found ineligible, the fee will be returned. The fee for examination for the certificate as clinical laboratory technologist shall be $5, payable with application, and not returnable in case of failure. If the applicant passes, an additional $5 must be paid before the certificate is issued. The annual renewal fee for license as clinical laboratory technologist shall be $10 for each year following the calendar year in which the certificate was issued, and payable within sixty days after the commencement of each calendar year.

(b) *Senior Clinical Laboratory Technicians.*—The fee for the examination and the certificate as senior clinical laboratory technician shall be $5, payable with application, and not returnable in case of failure. The license as senior clinical laboratory technician is good for the remainder of the calendar year in which issued, and must be renewed annually by the payment of a fee of $2 within sixty days after the commencement of each calendar year. A certificate as senior clinical laboratory technician will be issued without examination, but on the payment of the fee of $5, to all persons holding the four certificates of proficiency (Senior Grade in the old series) issued by the Board. In cases where an examination has been paid for in the securing of individual certificates, credit for such payments will apply on the fee for the issuance of the full certificate as senior clinical laboratory technician.

(c) *Certificates of Proficiency.*—These certificates, one in each of the subjects of bacteriology, serology, biochemistry, and parasitology, will be issued by examination in these subjects separately. The fee for the examination in any one subject and for the certificate and license good for the remainder of the calendar year is $2, not returnable in case of failure.

Persons now holding one or more certificates of proficiency will be issued licenses for the activities covered by the certificates which they hold. If an application for license without examination is filed, it may be found possible to include in the license issued other activities not covered by the certificate of proficiency held by the applicant.

A license in parasitology is given only by examination. The license as senior clinical laboratory technician is not given without examination except to holders of four certificates.

12. The law does not require technicians working in a doctor's office to be licensed unless work is done for other doctors or for the patients of other doctors.

13. The exemption of nonprofit hospitals, provided for in Section 6 of the law applies only to hospitals maintained by corporations for the benefit of their own employees, the hospitals being supported by "dues or contributions from employees of a common employer, or a group of affiliated employers. . . ."

14. The renewal fee for certificates of proficiency is fifty cents each, payable annually. A pocket license card is issued upon payment of the fee. Renewals and licenses for 1938 will be ready for distribution early in November.

15. Holders of four certificates of proficiency may exchange them for a senior clinical laboratory technician's certificate, or, if they meet certain other requirements, for a technologist's license.

ELIXIR SULFANILAMIDE—MASSENGILL*

Report of the United States Secretary of Agriculture

During September and October of 1937 at least seventy-three persons died as a direct result of taking the drug known as "Elixir Sulfanilamide." Twenty other persons who took the "elixir" died, but it has not yet been established that this drug was exclusively responsible. The ninety-three deaths occurred in fifteen states, as far east as Virginia, as far west as California.

"Elixir Sulfanilamide" was manufactured and sold by the S. E. Massengill Company of Bristol, Tennessee. According to the firm's books, 240 gallons were manufactured. The entire amount has been accounted for.

Before the "elixir" was put on the market, it was tested for flavor but not for its effect on human life. The existing Federal Food and Drugs Act does not require that new drugs be tested before they are placed on sale.

"Elixir Sulfanilamide" was first distributed commercially on September 4, 1937, and continued to October 15, 1937. The first word of deaths from an unidentified sulfanilamide preparation reached the Food and Drug Administration on October 14. On October 16 an investigator for the Administration telegraphed from Tulsa, Oklahoma, that nine persons had died there after taking "Elixir Sulfanilamide." Seizure of all outstanding shipments was immediately ordered.

Since the Federal Food and Drugs Act contains no provision against dangerous drugs, seizures had to be based on a charge that the word "elixir" implies an alcoholic solution, whereas this product was a diethylene glycol solution. Had the product been called a "solution," rather than an "elixir," no charge of violating the law could have been brought.

Of the 240 gallons manufactured, 228 gallons and 2 pints have been seized under federal and state laws, destroyed, collected as laboratory samples, or wasted by spillage and breakage. Eleven gallons and six pints were dispensed on prescriptions or over-the-counter sales. Of this amount, about half was consumed and caused the deaths; the other half was retrieved before consumption.

The lethal effect of the "elixir" was due to its content of diethylene glycol, which was used as a solvent in making a liquid preparation of sulfanilamide, usually administered in tablet or powder form. Sulfanilamide itself is a valuable drug, and was not responsible for the disaster.

Sulfanilamide is the name of one of a group of closely related chemicals first reported in European medical literature of 1935 to have been used for drug purposes. It has shown dramatic curative effects. Physicians in this country have been quick to recognize its far-reaching possibilities. Its use has grown to tremendous proportions. An editorial from the *Journal of the American Medical Association* stated that sulfanilamide is potentially dangerous, but that properly used it may be brilliantly successful in treating various infections.

The fatal "elixir" was rushed onto the market without adequate test to determine whether or not diethylene glycol may be safely used as a solvent for sulfanilamide, despite previously published reports in scientific literature showing that diethylene glycol might be dangerous when taken internally. A few simple and inexpensive tests on experimental animals would have quickly demonstrated the toxic properties of both diethylene glycol and the "elixir."

It will be observed that the preparation is a semi-secret one, that the presence of diethylene glycol is not disclosed, and that no warning of danger appears.

Most of the drug was administered on physicians' prescriptions.

HOW THE "ELIXIR" WAS PRODUCED

For some time before putting "Elixir Sulfanilamide" on the market, the S. E. Massengill Company had been marketing sulfanilamide in capsule and tablet form. In June, 1937, the firm's salesmen reported a demand for the drug in liquid form. Near the end of July, Mr. Watkins,

* Submitted to Congress at Washington, D. C., in response to House Resolution 352 of November 18, 1937, and Senate Resolution 194 of November 16, 1937.

See also editorial comment in December CALIFORNIA AND WESTERN MEDICINE, on page 366. For list of United States Senators and Representatives, to whom letters may be sent, in favor of revision of Federal Food and Drug laws, see in this issue on page 71.

chief chemist of the Massengill Company, according to his own statement, undertook the problem of finding a suitable liquid vehicle for sulfanilamide. Since sulfanilamide is insoluble in the various liquids commonly employed in making medicines, he tried a number of other solvents. Diethylene glycol was found to dissolve as much as 75 grains of sulfanilamide per fluidounce, but in that concentration it tended to separate out on chilling. Accordingly he decided upon 40 grains per fluidounce as a stable preparation and devised the following working formula:

Sulfanilamid	58½ pounds
Elixir Flavor	1 gallon
Raspberry Extract	1 pint
Saccharin Soluble	1 pound
Amaranth Solution 1-16	1½ pints
Caramel	2 fluidounces
Diethylene Glycol	60 gallons
Water q. s.	80 gallons

According to Mr. Watkins no tests were made to determine the toxicity of either the separate ingredients or of the finished product, or to determine by well-known methods available for the purpose whether or not the sulfanilamide decomposed in the diethylene glycol. The so-called control laboratory merely checked the "elixir" for appearance, flavor, and fragrance. Doctor Massengill confirmed Mr. Watkins' statement that no experimental animals were used or clinical tests of any kind made to determine either the effectiveness or the toxicity of the drug before it was put on the market.

THE FOOD AND DRUG ADMINISTRATION STEPS IN

The first word of deaths from an unidentified sulfanilamide preparation reached the Food and Drug Administration on October 14, 1937, through a telephone call from a New York physician associated with a large drug manufacturing concern. He repeated advices, presumably received through professional or trade contacts, that fatalities had occurred at Tulsa, Oklahoma.

Immediately instructions to investigate the report were issued by telegraph to the Kansas City station of the Food and Drug Administration, which is the nearest station to Tulsa. A representative of the Administration arrived in Tulsa the following day. He reported by telegraph on Saturday, October 16, that nine deaths had already occurred in Tulsa, including eight children with streptococcic sore throat and one adult with gonorrhea, and that all had taken a product labeled "Elixir Sulfanilamide. The S. E. Massengill Company, Manufacturing Pharmacists, Bristol, Tennessee."

Shipping records showed that the suspected "elixir" had come from a Massengill establishment in Kansas City, to which the station immediately sent inspectors. Also an inspector from the Cincinnati station, which is the nearest station to Bristol, and a medical officer from the Administration's headquarters at Washington, were sent at once to Bristol.

It was found that some of the "elixir" had been made at the Kansas City branch factory and that supplies had been sent to the New York and San Francisco sales branches. Immediately inspectors from the New York and San Francisco stations were assigned to investigate distributions from these points.

It was learned that the Massengill Company, following reports of the poisonous effects of the "elixir," had sent out approximately 375 telegrams from Bristol and additional telegrams from its branch houses totaling, according to the firm's statement, some 1,100 in all, requesting the return of outstanding shipments.

On or about October 15, on telegraphed instructions from the Bristol office, the San Francisco branch of the firm instructed its salesmen to have outstanding stocks returned. However, investigation revealed that no attempt had been made by that branch to communicate directly with dealers and doctors.

The telegrams and letters sent out by the Massengill Company gave no indication of the dangerous character of the product and were not calculated to impress receivers with the emergency character of the call for returning the goods, the inspector assigned to the Bristol office insisted that the firm issue the following telegram, dated October 19, to all persons who were listed as having received shipments of the "elixir" from Bristol:

> Imperative you take up immediately all Elixir Sulfanilamide you dispensed. Product may be dangerous to life. Return our expense.

Following similar insistence by the San Francisco, Kansas City, and New York inspectors, the branches at those points sent the following or similar telegrams to all consignees, on or about October 19:

> Imperative you take up immediately all Elixir Sulfanilamide you may have dispensed. Product may be dangerous to life. Return all stocks our expense.

As a result of these telegrams large quantities of the "elixir" was returned to the manufacturer's establishments and there taken under local or federal control. But the extremely dangerous character of the drug necessitated the most searching check to guarantee, as far as humanly possible, its complete apprehension. Practically the entire field force of 239 Food and Drug Administration inspectors and chemists were assigned to the work. They had the wholehearted and effective coöperation of state and local food, drugs, and health authorities. As an additional aid, warnings by newspaper and radio were broadcast.

In spite of the manufacturer's telegrams many shipments were found still in dealers' hands. Innumerable prescriptions filled from these lots, as well as from shipments returned to the manufacturer, were found to have been only partly consumed by the patient and so were recovered.

EFFECTS OF THE DRUG

The victims of the "elixir" were ill from about seven to twenty-one days. They suffered intense pain. All exhibited very much the same symptoms: stoppage of urine, severe abdominal pain, nausea and vomiting; stupor; convulsions preceded death in some cases. Many persons who took the drug discontinued its use with the onset of unfavorable symptoms and recovered. One person took as much as seven and one-half fluidounces without ill effect. One child died from less than two fluidounces.

LIMITATIONS OF THE LAW

As indicated earlier in this report, the only basis of action under the Food and Drugs Act against the interstate distribution of the "elixir" was the allegation that the word implies an alcoholic solution, whereas the product was a diethylene glycol solution. The fact that the law contains no specific definition of "elixir" may be responsible for Doctor Massengill's statement in his letter to the American Medical Association, carried in the press of November 3: "I have violated no law."

Most drug manufacturers recognize a responsibility to the public far greater than that imposed by existing law. Some are known to have considered making a solution of sulfanilamide in diethylene glycol before the "elixir" was put on the market, but abandoned the idea on investigating the toxicity of the solvent. But the attitude of some drug makers is exemplified in Doctor Massengill's statement carried by the press on October 23:

> My chemists and I deeply regret the fatal results, but there was no error in the manufacture of the product. We have been supplying legitimate professional demand and not once could have foreseen the unlooked-for results. I do not feel that there was any responsibility on our part. The chemical sulfanilamide had been approved for use and had been used in large quantities in other forms, and now its many bad effects are developing.

That evidence of possible danger from the internal administration of diethylene glycol was available prior to the marketing of the "elixir" is easily shown.

That a few simple tests on experimental animals would have demonstrated the lethal properties of the elixir is evident from the work reported by the American Medical Association. These results were confirmed independently by the Division of Pharmacology of the Food and Drug Administration in work yet unpublished.

While the "elixir" incident has been spectacular and has received much publicity, aside from the brevity of the period in which the killings occurred, it is but a repetition of what has frequently happened in the past in the marketing of such dangerous drugs as dinitrophenol, cinchophen, and other toxic substances.

It is worthy of note that, shocking as these instances have been, the actual toll in deaths and permanent injury from potent drugs is probably far less than that resulting from harmless nostrums offered for serious disease conditions. In these cases the harmful effect is an indirect one.

Sick people rely on false curative claims made for worthless concoctions, and thus permit their disease to progress unchecked. It may be too late when they lose confidence in the nostrum and seek rational treatment.

RECOMMENDATIONS FOR LEGISLATION

To protect the public from drugs which, like the "elixir," are dangerous because of their inherent toxicity, it is the Department's recommendation that legislation be enacted to provide at least the following:

1. License control of new drugs to insure that they will not be generally distributed until experimental and clinical tests have shown them to be safe for use. The definition of what constitutes a new drug should include (*a*) substances which have not been used sufficiently as drugs to become generally recognized as safe, (*b*) combinations of well-known drug substances where such combinations have not become generally recognized as safe, and (*c*) well-known drug substances and drug combinations bearing label directions for higher dosage or more frequent dosage or for longer duration of use than has become generally recognized as safe.

Exemption should be made for new drugs distributed to competent investigators for experimental work. A board of experts should be provided who will advise the Secretary of Agriculture on the safety of new drugs.

It is the Department's view that no other form of control will effectively safeguard the public from the dangers of premature distribution of new drugs. To increase the penalties for violations and to require label disclosure of ingredients would be helpful, but by no means fully adequate.

In the interest of safety, society has required that physicians be licensed to practice the healing art. Pharmacists are licensed to compound and dispense drugs. Electricians, plumbers, and steam engineers pursue their respective trades under license. But there is no such control to prevent incompetent drug manufacturers from marketing any kind of lethal potion.

2. Prohibition of drugs which are dangerous to health when administered in accordance with the manufacturer's directions for use. This would provide a more appropriate basis of action than that on which proceedings were instituted against the "elixir." A number of dangerous drugs are now on the market against which not even a trivial charge of violation can be made.

3. Requirement that drug labels bear appropriate directions for use and warnings against probable misuse. Much injury results from insufficient directions and from lack of warning against overdosage, or administration to children, or use in disease conditions where the drug is dangerous, or possibility of drug addiction.

4. Prohibition of secret remedies by requiring that labels disclose fully the composition of drugs. Many foreign countries now impose this requirement. Many drugs manufactured in the United States are exported to such countries under labels bearing such disclosure. The same drugs are sold to our citizens under labels that give no hint of their composition.

The physician, and the consumer who acts as physician to himself, both have a right to know what they administer.

Many poisoning cases result from choice of the wrong bottle from the home medicine cabinet, or from bottles left within the reach of small children. In such cases attending physicians are able to proceed intelligently and administer the proper antidotes or other treatment only if labels carry full disclosure of composition. Delays in obtaining this information by communicating with the manufacturer may often mean the difference between life and death.

Physicians are also handicapped in arriving at a correct diagnosis and beginning appropriate treatment when patients come to them after unsuccessful attempts at self-medication with secret remedies. The effect of such remedies may give rise to symptoms leading to erroneous diagnosis. But even if the diagnosis is correct, the kind of treatment to be used may depend upon what the patient has been taking. Again, in such circumstances, label declaration of composition may mean the difference between life and death.

The foregoing recommendations are limited to provisions which the Department believes should be enacted to safeguard the public from the dangers of drugs of one type. That type includes the inherently toxic drugs, such as the "elixir," dinitrophenol, and cinchophen. Many additional points should be considered if adequate protection is to be extended against even more widespread dangers to health and other abuses of public welfare arising from the inadequate control authorized by the present law over various other types of drugs.

PUBLIC HEALTH IS MAJOR EFFORT OF FEDERAL FOOD AND DRUG ADMINISTRATION*

Control of food and drug adulterations having a direct bearing on public health continued to require the major efforts of the Food and Drug Administration in the last fiscal year, according to the annual report of W. G. Campbell, Chief of the Administration.

Mobilization of an emergency force to follow the 1937 flood in the Ohio Valley and protect residents from food contaminated by flood waters was one of the conspicuous services by the Food and Drug Administration in the last year. Many of the forty-four federal food men assigned to the work had had experience in the 1936 flood. They were assisted by about eighty men from state and city food inspection organizations and from other federal agencies. The emergency organization functioned promptly. Work programs were under way in some areas before the flood waters began to recede. These crews handled food and drug preparations enough to have supplied a city of two hundred thousand population for a full year.

Another emergency requiring quick action by many field employees arose when it was discovered that emergency fumigation with hydrocyanic gas had made dangerous a quantity of raisins and other dried fruits—about 280,000 pounds—held up at the shipping point during the maritime strike and that these had been widely distributed. Food and Drug Administration workers quickly traced and seized nearly all the contaminated food, and the use of this method of fumigation for these commodities was immediately discontinued.

FINES VARY WIDELY

Mr. Campbell comments on the 1,700 court cases terminated in the year—1,355 food cases and 345 drug cases. "Fines varied," he says, "from sums as low as $1, $2, and $5 to a maximum actually paid of $1,500. Much higher fines were imposed in several cases, but were remitted in large part by the courts. Three jail sentences imposed in connection with second offenses were also suspended and the defendants placed on probation. In pleas of guilty to the adulteration of olive oil with tea-seed oil, two defendants were each fined $6,000, but $5,000 was subsequently remitted in each case.

"Courts in general vouchsafed no explanation for the imposition of nominal penalties. In one instance of a $2 penalty for the shipment of filthy and decomposed walnuts, the court indicated that it had taken into consideration the fact that the defendant had suffered a $1,400 loss in the seizure and destruction of the shipment by the Government. In another instance dealing with a practically worthless product offered as a treatment for serious diseases of the eye, the court imposed without comment, a fine of $1 and costs of $35."

"Other courts," Mr. Campbell continues, "have indicated a growing interest in the public protection afforded by the Food and Drugs Act. In passing sentence against a spinach canner who had entered a plea of guilty to the sale of dirty canned spinach, a court remarked that if the defendant was unable to manufacture clean food he had better get out of business and stay out of that court."

ISSUES IN LEGISLATION

Discussing possible changes in the law, Mr. Campbell says: "As in the three preceding years, legislative efforts have been continued in the Congress for a more adequate food and drug law. Senate Bill 5, introduced January 6, 1937, was passed by the Senate on March 9. This bill pro-

* From the United States Department of Agriculture.

poses a comprehensive revision of the Food and Drugs Act. Other bills of similar character are H. R. 300 and H. R. 5286. H. R. 5286 is designed to amend the Federal Trade Commission Act by authorizing specific control under that Act of false advertising of foods, drugs, therapeutic devices, and cosmetics.

"At the close of the fiscal year all these measures were pending before the House Committee on Interstate and Foreign Commerce. The principal issues involved were:

"1. Should seizure action to prevent distribution to consumers of a misbranded product be limited, pending court trial of the case, to a single interstate shipment of that article, or should the authority in the present law to seize all such shipments be continued?

"2. Should seizure cases be tried, as at present, where the goods are seized, before the courts and juries of the consuming areas where the goods are intended for distribution, or should the law be changed to authorize the case to be removed to the place from which the goods were shipped and there tried before the courts and juries of producing areas?

"3. Should the misbranding provision of the present law, which prohibits labeling that is 'false or misleading in any particular' be retained, or should the standard of truthfulness thus imposed be changed to ban labels only when 'misleading in a material respect'?

"4. Should false advertising of foods, drugs, therapeutic devices, and cosmetics be controlled through injunctions and cease-and-desist orders, which carry no penalty for the initial offense or for subsequent offenses up until the date the injunction or order becomes effective, or should a deterrent to the commission of these offenses be set up by providing penalties for their initial commission?"

ENFORCEMENT OF ACT

As compared with 1936, the Administration collected more samples of food and drugs, but there were slight decreases in the totals of the criminal prosecutions and seizures. Improvement in foreign trade was reflected in an increase in the number of import samples and in time devoted to imports.

The spray residue situation has improved materially, largely because many states now meet fully the federal standards and are controlling poisonous spray residues on fruits and vegetables before the products leave the State. Federal workers analyzed more than 5,000 samples of fresh fruits and vegetables, but on incomplete returns State laboratories are known to have made more than 85,000 tests.

"Continuing the good record of several years, no authentic case of botulism from American commercially canned food was reported," says Mr. Campbell.

Both the salmon and tuna packs required considerable control last year, but the sardine and mackerel packs gave no reason for seizures. The Administration and the salmon-packing industry have worked out a new method for simplifying the control of the pack and making it more effective.

Adulteration of food with water is one of the most profitable forms of economic cheats, and one of the hardest to deal with, says the report, emphasizing the need for legal standards to establish limits on the water content of canned and bottled products.

The Administration tested the vitamin D value of nearly 900,000 gallons of imported oils—principally cod-liver oil, intended for animal feeding. About one-third was deficient in vitamin value and was excluded. In interstate tests of vitamin products, twenty-four out of thirty-four samples failed to show the vitamin values claimed for them.

Conditions are improving notably, but the campaign for cleaner cream and butter will have to be continued, the report says. It also includes records of the enforcement of several minor acts administered by the Food and Drug Administration that regulate insecticide, caustic poisons, import milk, filled milk, naval stores, tea imports, and the certification of coal-tar colors.

UNITED STATES SENATORS AND REPRESENTATIVES IN CONGRESS: FOR CALIFORNIA

With Special Reference to Federal Pure Food and Drug Law

For the information of county society secretaries and members of the California Medical Association who desire to write to the two United States Senators from California and to the Representatives from their own and other districts, the roster of congressmen is given below.

While Congress is in session, as at the time of this writing, these congressmen may be addressed as follows:

Hon. ————————
Senator for California
(or Congressman for California)
Washington, D. C.

California and Western Medicine, in its December issue, on pages 366 and 435, discussed the Federal Food and Drug laws. County societies were urged to write to congressmen. The roster below may be of service.

UNITED STATES SENATORS AND REPRESENTATIVES IN CONGRESS

United States Senators

Hiram W. Johnson (Rep.), Mills Tower Building, San Francisco.

William G. McAdoo (Dem.), Transamerica Building, Los Angeles.

Represenatives in Congress

Clarence F. Lea (Dem., Rep.), 719 North Street, Santa Rosa, First District.

Harry L. Englebright (Rep., Dem.), Nevada City, Second District.

Frank H. Buck (Dem.), Vacaville, Third District.

Franck R. Havenner (Prog.), 640 Ellis Street, San Francisco, Fourth District.

Richard J. Welch (Rep., Dem., Prog.), 978 Guerrero Street, San Francisco, Fifth District.

Albert E. Carter (Rep., Dem., Prog.), 552 Montclair Street, Oakland, Sixth District.

John H. Tolan (Dem.), 1007 Harvard Road, Oakland, Seventh District.

John Joseph McGrath (Dem., Rep., Prog.), 280 Crystal Springs Road, San Mateo, Eighth District.

B. W. Gearhart (Rep., Dem.), 857 M Street, Fresno, Ninth District.

Henry E. Stubbs (Dem.), 707 East Cypress, Santa Maria, Tenth District.

John Steven McGroarty (Dem.), Tujunga, Eleventh District.

H. Jerry Voorhis (Dem.), Valley Center, San Dimas, Twelfth District.

Charles Kramer (Dem.), 1947 North Serrano, Los Angeles, Thirteenth District.

Thomas F. Ford (Dem.), 940 North Benton Way, Los Angeles, Fourteenth District.

John M. Costello (Dem.), 2142 Canyon Drive, Hollywood, Fifteenth District.

John F. Dockweiler (Dem., Rep.), 935 South Dunsmuir, Los Angeles, Sixteenth District.

Charles J. Colden (Dem.), 2200 Alma Street, San Pedro, Los Angeles, Seventeenth District.

Byron N. Scott (Dem.), 6325 East Ocean Boulevard, Long Beach, Eighteenth District.

Harry N. Sheppard (Dem.), Box 465 Yucaipa, Nineteenth District.

E. V. Isaac (Dem.), 5380 El Cajon, San Diego, Twentieth District.

Do Not Coddle Diabetic Child, Physicians Warn.—Severe onsets of diabetes in children may be due principally to false notions and neglect in parents, in many instances. Ordinarily, diabetic children under adequate treatment are as healthy otherwise as so-called normal children, and should be treated like others of their age. They should not be singled out by the parents for special coddling or undirected home treatment, nor should they be segregated from other children or adults.

This statement is made by the Division of Pediatrics of the University of California Medical School, in an effort to decrease the disabilities of children during the acute phases of child diabetes generally.

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. XI, No. 1, January, 1913

From some Society Reports:

California Northern District Medical Society.—The twenty-second annual meeting was held at Elks Hall, Chico, November 19, 1912. New officers elected: President, Dr. Dan Moulton, Chico; First Vice-President, Dr. G. H. Fay, East Auburn; Second Vice-President, Doctor Peery, Yuba City; Secretary, Dr. F. F. Gundrum, Sacramento; and Treasurer, Dr. O. Stansbury, Chico.

Glenn County Medical Society.—On November 21, a first meeting was called by the physicians of Glenn County for the purpose of organizing a county medical society. Dr. J. A. Randolph was chosen temporary chairman, and Dr. F. M. Lawson temporary secretary.

Our Medical Defense.—

To the Medical Society of the State of California.
Gentlemen:

I wish to thank the Society for the manner in which it looked after the defense of the malpractice suit brought against me by J. F. Beene, who suffered from a delayed union of the radius and ulnar of the left arm. Your defense was thorough and every precaution was taken for the protection of my professional reputation, as well as my finances, and no corporation insurance company or individual could have more surely or successfully cared for and protected my interests.

I wish it were possible for the whole profession to realize the importance of having the Society back of them, as I do. Any physician is just as liable to have a suit brought against him as I was, and no better protection can be had than I got in my recent trial.

Very truly yours,
N. T. Enloe,
Chico, Calif.

From some Editorial Notes:

Proper Reciprocity.—The "Fresno Republican," in its issue for November 21, again discusses the *Journal* of the Medical Society of the State of California and the question of medical reciprocity, and asks, "Will the *Journal* say whether it favors a reciprocity law, such as most other states have, to apply to states having equally high standards?" Most unequivocally, *yes!* Not only does the *State Journal* approve of a *proper* reciprocity law, but the State Medical Society, when it prepared the law of 1901, included in that law a reciprocity clause. Is that sufficient indication of the attitude of the Society and of its *Journal?*

* * *

Progress in Anesthesia.—The last few years have seen considerable progress in the development of improved anesthetics and improvement in the manner of producing anesthesia. It is quite a while since the spectacle of two or three husky men holding one poor patient, while another helper crowded a mask over his face, has faded away. Gwathmey has recently made a suggestion that, during the limited time it has been tried, seems to be a distinct advance in anesthesia. He begins the anesthesia with two to four drops of essence of orange (25 per cent U.S.P.), and then continues with the drop method of ether anesthesia. In a recent paper in the *Journal of the American Medical Association,* he highly commends the work of the Committee on Anesthesia of the Association, and recommends that it be continued. He also suggests that the future development in anesthesia should be along the line of some form of "vapor anesthesia."

* * *

Congresses and Clinics.—The great surgical congress recently held in New York seems, from the accounts of

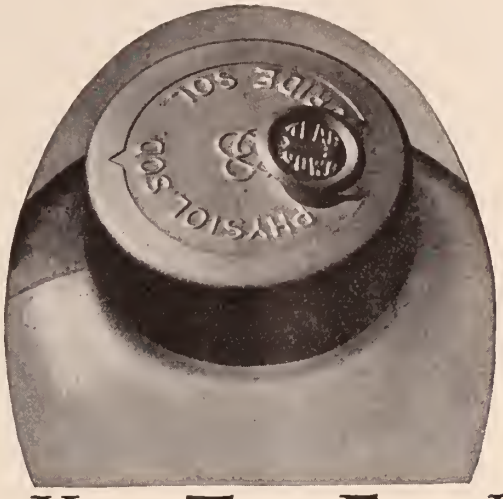
BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By Charles B. Pinkham, M.D.
Secretary-Treasurer



"Los Angeles is America's No. 1 quack nest. This was the declaration of Dr. Morris Fishbein, Editor of the *Journal of the American Medical Association,* yesterday, when he addressed the fourth annual post-graduate assembly of the College of Medical Evangelists. 'It is high time State officials were driving the quacks out of business in Los Angeles,' he said. 'I have been in every city in the United States at least five times in the last two years, and I say without reservation that Los Angeles has more quacks than any other place in the country. This city is full of medical charlatans and mumbo-jumbo practitioners of all kinds. It is up to the State of California to clean up the town.' Doctor Fishbein declared medical quacks are ruining the lives of hundreds of persons every year. 'These fakers, with their lurid promises of cure-alls, are bringing sorrow and tragedy to many of our citizens,' he said. 'I urge the men and women of the medical profession to join the fight to end the widespread quackery in Los Angeles.' Doctor Fishbein addressed one thousand physicians and surgeons in Paulson Hall of White Memorial Hospital. . . ." (Los Angeles *Examiner,* December 6, 1937.) The Annual Reports of the Board of Medical Examiners for many years past verify the statements quoted. For instance, Los Angeles Special Agent Carter in his Annual Report for 1933 said, "Throughout the past year we have made continual effort to prosecute and drive from California various fakers, who, on one pretext or another, prey upon the sick and afflicted. . . . These charlatans come to California from all over the world and, strange as it may seem, they always find some poor sucker who falls for their new discovery, or machine, or method that is heralded as a sure cure for almost every ailment mankind is heir to. Apparently intelligent persons, who would think they were grossly overcharged if a regular physician charged them a $10 fee, will cheerfully pay $250 to $2,000 for a fake 'radium operation' on their eyes by a smooth-talking confidence man, whom they never saw or heard of before. . . ." The number of charlatans is so great and the majority are so well entrenched by astute legal advice, that the four investigators allowed the Board of Medical Examiners find insurmountable difficulties in endeavoring to make an impression on the host referred to. The monthly report of the Board of Medical Examiners, both North and South, speaks for itself as to the continued activities of said Board in endeavoring to protect the citizens of this State from imposition and fraud.

"Richard J. Howard, seventy-one, Hacienda rancher, was lodged in the county jail at Santa Rosa, Wednesday night, on complaint of an inspector for the State Board of Medical Examiners. He is accused of practicing medicine without a license. Arrested as Howard's assistant in what T. P. Hunter, the state investigator, termed a 'quack' cancer cure, was William P. Devine. The state official also seized a supply of patent medicines which he claimed were used by Howard, once widely known throughout Sonoma Valley as 'Doctor' Howard. The arrests were the result of an asserted course of treatment given to an aged Kenwood resident, said to be a cancer sufferer, officers said. . . . Records at the county jail show that Howard has been arrested several times in recent years for asserted violation of the State Medical Practice Act. . . ." (Petaluma *Argus-Courier,* November 11, 1937.) (Previous entries, December, 1929; June, 1932.)

"Surprise is created by the news that a sufferer from disease intrusted his case to a quack rather than to a reputable physician. One naturally wonders why anyone will take chances in a matter of such moment with persons

INTRAVENOUS SOLUTIONS IN VACOLITERS

A Metal Tamper-proof Seal Protects Your Solutions

Laboratory tests for sterility and stability don't mean a thing to you unless the solutions are right *when you use them.*

The Baxter Laboratories' first task was to insure the reliability of BAXTER'S solutions not only in their laboratories but *in the hospital . . . at the patient's bedside . . .* where safety counts. The metal closure which seals every VACOLITER shows you the container has never been opened . . . because to open the VACOLITER you must *destroy* the seal.

You can have this protection for your patients; and with it the valuable time-saving convenience of the VACOLITER when giving intravenous fluids. Insist on the BAXTER VACOLITER.

For Acidity and Allied Conditions, we suggest

ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

A Natural Mineral Water
SHOWING MAIN CONSTITUENTS

CANNED FOODS IN THE CONTROL OF LATENT AVITAMINOSIS B1

● Apparently mild vitamin B1 deficiency in humans is not characterized by very definite or entirely specific symptoms. While such a condition may be attended by anorexia, hypotonicity of the bowel, indigestion, vague pains and malaise, latent avitaminosis B1 hardly presents a picture which is favorable to its early clinical detection. However, there are two procedures which may be employed when this type of avitaminosis is suspected.

The first procedure (1a) depends upon the nature of the response to administration of pure vitamin B1. The second procedure, which has been more widely applied, makes use of the Cowgill formula for calculation of vitamin B1 requirement. By consideration of the actual vitamin B1 intake and the calculated vitamin B1 requirement in any specific instance, the probability of mild avitaminosis B1 may be evaluated (1b).

It is difficult to estimate the frequency of mild vitamin B1 deficiencies in the United States. However, until such information is at hand, it is not illogical to suggest that latent avitaminosis B1 must be regarded as an active possibility in some cases which may come to the attention of the medical practitioner. Fortunately, several factors are operative which give assurance that eventually the incidence of latent avitaminosis B1 will be reduced to a minimum.

First, those concerned with human nutrition have today more definite information concerning quantitative human vitamin requirements than ever before in history (2).

Second, every passing year brings marked progress in education of the layman to the necessity of a completely "protective" diet. The control of the latent avitaminoses is, in large part, dependent upon proper food selection and correct formulation of the diet by the layman consumer.

In the establishment of dietary regimes which will be protective against vitamin deficiencies, commercially canned foods may play an important part. Several hundred canned foods are available upon the American market at all seasons of the year. Nutritional research has shown (3) that modern canned foods retain in good degree the vitamin B1 contents of the raw materials from which they were prepared. This great class of foods—available to all consumers regardless of economic status—will contribute substantially to the alleviation and prevention of latent avitaminosis B1 in this country.

The Greatest Menace of All.—During the World War, poison gases were discussed by the average citizen with fear and loathing. Today, newspapers cry war, and frighten us with tales of future gas attacks on our cities, killing men, women, and children. Few who read these news stories realize, however, that carbon monoxid gas is now, and has been since the cave dwellers first discovered fire, the most widespread and treacherous poison connected with human life and activities—treacherous in that it seldom gives warning, being colorless, odorless, tasteless, and non-irritating. Carbon monoxid poisonings were occurring before Babylon had risen. Ancient writers mentioned deaths that were undoubtedly due to carbon monoxid, and in the Middle Ages its activities were ascribed to witchcraft and many women were burned for "hexing" a family that was found dead. Suicides by carbon monoxid generated by carbon braziers became so prevalent in France that frequent references are made to them in the literature of Dumas, Victor Hugo, and Eugene Sue.

Today, deaths from carbon monoxid bow only to automobile fatalities and take second place as the cause of accidental and suicidal deaths.

We rightly hear a great hue and cry concerning the traffic accidents in our country. Everyone knows that there were roughly 36,000 deaths due to traffic accidents in 1935. How many people know, however, that there are roughly 50,000 deaths from asphyxiation in the United States each year, and half of them are due to carbon monoxid! Briefly, by rough comparison, whenever seven people are killed by automobiles, five die of carbon monoxid poisoning. This ratio is further shown by a comparison with accurate sta-

tistics for New York City. There were, in a five-year period (1928-1932), 5,289 carbon monoxid deaths, an average of over 1,000 a year. The number of these accidents was exceeded only by motor-vehicle deaths with an average of 1,400 a year, or again seven for automobiles and five for carbon monoxid.

And carbon monoxid deaths are on the increase! In the article, "Carbon Monoxid Poisoning Makes an Enormous Increase" (Ohio Health News, October 15, 1936), we find that during the year ending September 30, 1936, the number of reported cases of carbon monoxid poisoning in Ohio increased 77 per cent (with 42 per cent increase in deaths) over the preceding year!

Carbon monoxid is not a true poison. Its deadly action is due to asphyxia. It displaces oxygen from the hemoglobin of the blood, thus depriving the vital organs of oxygen. It has been proved by Haldane that carbon monoxid has an affinity three hundred times greater for hemoglobin than has oxygen. Hence, fatal poisoning can quickly overcome the exposed person before he is aware of the danger. Carbon monoxid is rarely found in a free state. It is a product of incomplete combustion of carbonaceous material. The use, therefore, of any form of carbonaceous fuel, such as wood, coal, charcoal, gas, oil, kerosene, and gasoline, is dangerous unless there is an efficient method of drawing off the combustion products. The unflued heating stove is very dangerous. When a gas flame touches cold metal, carbon monoxid is generated, hence instantaneous hot-water heaters are a constant menace. Automobiles are exceptionally efficient generators of carbon monoxid; the average automobile giving off one cubic foot of carbon monoxid every minute for every twenty horsepower.

There is danger of fatal poisoning if air containing as much as one-half of one per cent carbon monoxid is breathed for fifteen minutes and concentrations over 0.2 per cent are dangerous if inhaled over a period of time. Exercise and exertion greatly increase the speed of absorption and hasten collapse.

Carbon monoxid poisonings are usually specified as rapid acute, slow acute, and chronic. Symptoms of acute poisoning vary with the intensity and the amount of carbon monoxid entering the body. In some cases the intensity is so great that the victim becomes unconscious before he is aware of the danger. Here, only immediate rescue can save his life. In other acute cases the victim has warning symptoms, the most common being a severe headache with a sense of throbbing and pressure, particularly in the region of the temples. Other symptoms are dizziness, nausea, sometimes vomiting, pains in the upper abdomen, weakness in the legs, palpitation, disinclination to move, hallucinations, and sometimes mental disturbances and convulsions. Judgment is often impaired and cases have been reported where the victim has refused to leave the gas-filled room and fought with his rescuers.

When the victim becomes comatose he may present one of several pictures. Sometimes he may show pink skin, red lips, and red blotchy skin areas. Again there may be pallor, or again bluish skin (cyanosis). Useless movements of the muscles of the face or arms and legs may occur. Coma may last from a few minutes to several days after rescue, although when it continues more than forty-eight hours it is usually fatal. A positive diagnosis cannot be made, however, on the above-named symptoms. One must get a history of exposure to carbon monoxid. The blood is usually cherry red. Positive diagnosis is based on finding carbon monoxid in the blood. This can be done by a very simple chemical analysis of a drop or so of the blood. This test must be made promptly after rescue, however, since the properly breathing victim exhales about one-half of the carbon monoxid within him during each hour following rescue. The breathing of oxygen gas materially hastens this displacement.

Many after-effects may follow acute carbon monoxid poisoning. Pneumonia sometimes occurs during or after coma, particularly if smoke is breathed at the same time or if the victim is not kept warm. Definite nervous and mental

DIABETICS

LIVE LONGER

Today

THE LIFE SPAN of the diabetic has been lengthened considerably following the discovery of Insulin and the growing knowledge of its use. There is, however, a definite responsibility on the part of the physician to educate the many new diabetics in the importance of proper diet and proper use of Insulin preparations.

The apparent increase in diabetes in recent years has been attributed to the modern manner of living, increased sugar consumption, overeating and lack of muscular exercise. With proper management the great majority of patients can be kept well-nourished, sugar-free, and at work.

Insulin Squibb is an aqueous solution of the active anti-diabetic principle obtained from pancreas.

It is accurately assayed, uniformly potent, carefully purified, highly stable and remarkably free of pigmentary impurities and proteinous reaction-producing substances.

Insulin Squibb of the usual strengths is supplied in 5-cc. and 10-cc. vials.

Protamine Zinc Insulin, *Squibb* complies with the rigid specifications of the Insulin Committee, University of Toronto, under whose control it is manufactured and supplied. It is available in 10-cc. vials. When this preparation is brought into uniform suspension, each cc. contains 40 units of Insulin together with protamine and approximately 0.08 mg. of zinc.

E·R·SQUIBB & SONS, NEW YORK

MANUFACTURING CHEMISTS TO THE MEDICAL PROFESSION SINCE 1858

These cabinets hold more than 85,000 addressograph plates, each containing the name and address of a physician who has written us about S. M. A.

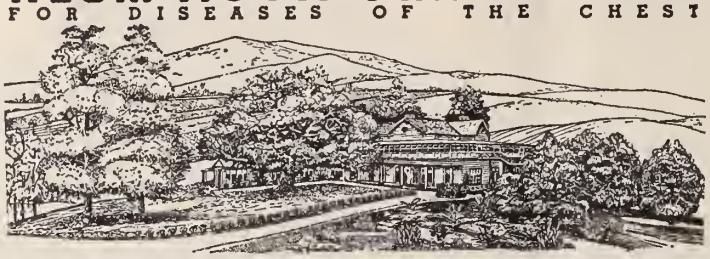
2 OUT OF 3 PHYSICIANS IN THE UNITED STATES HAVE ASKED FOR S.M.A.

Many infant feeding products are available to physicians today. Still, the fact that physicians have been seeking something to provide good nutritional results more simply and more quickly is apparent when more than 85,000 physicians have shown interest in, asked for samples of, or prescribed S. M. A. during the past few years.

This means that two out of three active, practicing physicians in the whole United States, know the advantages of S.M.A., the antirachitic and antispasmophilic breast milk adaptation for infants deprived of breast milk.

S. M. A. is offered ethically, having always been advertised only in professional journals, yet it is available in nearly every prescription pharmacy in the United States — an indication of its widespread acceptance by physicians who sought an adaptation to breast milk that would avoid nutritional deficiencies.

Physicians choose S. M. A. because they find it produces excellent nutritional results. They know that chemically and physically S. M. A. resembles human milk very closely, that it is especially intended for infant feeding. And many physicians prefer to prescribe a product of a firm whose sole interest is nutrition—knowing that the intelligence and facilities of a corps of trained nutritional research men are working to help them provide the best available for their patients.



You are invited to send your prescription blank for samples and literature.

disturbances are seen. Mental derangements may simulate many forms of insanity. Dr. William McGurn lists 105 various disease conditions caused by this gas.

A series of acute poisonings was recently examined for late after-results. These cases were selected poisonings in which the victims had been unconscious for at least one-half hour and were examined from several months to over a year and one-half after the mishap. After-effects were taken only when proved to be definite results of the exposure and were found to be as follows: Extreme nervousness (in more than 50 per cent of the cases), twitching of the muscles, tremor of the fingers, insomnia, and emotional disturbances (mental retardation, rage, etc.). One patient has developed a marked, progressive dimness of vision. He had been gassed to unconsciousness on two occasions and lightly gassed in a third mishap. Several specialists who examined him found no organic cause for this loss of vision.

Other after-effects, fortunately rare, are complete deafness, blindness, loss of speech, paralysis, and gangrene.

Chronic carbon monoxid poisoning is produced by continual exposure to small amounts of the gas. Unfortunately we have no way of knowing what proportion of the population is continually complaining of minor illnesses really representing victims of this insidious condition. Proved cases of chronic poisoning exhibit symptoms which may occur in innumerable diseases. Some of these symptoms are frequent or continuous headaches, dizziness, hot flushes, palpitation of the heart, anemia, generalized weakness, and impaired mental functions. Fortunately, these symptoms generally disappear promptly when exposure to the gas ceases.

Here as in all problems in the treatment of diseases the best is prevention, of which we shall speak later.

For the immediate treatment of the acutely poisoned victim we should always remember, first, to remove him from the gas-filled atmosphere, and, second, artificial respiration by the well-known prone pressure method until respiration is going well. Be sure to call for help from the closest police station, fire department, physician, or hospital. Many of these are equipped with an inhalator containing a mixture of oxygen and carbon dioxid which can be promptly applied to the victim by the use of a face mask which accompanies the inhalator. They bring blankets, also, to keep the victim warm.

Again we say that prevention is the best treatment and ring the bells of warning that have so often been rung before, namely:

"Watch carefully in your home: (1) gas stove in the bedroom; (2) gas range used for heating a room; (3) water heater in the bathroom; (4) loose gas-cocks and pipe connections; (5) unflued gas fire in any room; (6) loose stove and furnace connections; and (7) do not pour water on hot coals.

"For your automobile: (1) do not start it in a closed garage; (2) do not work on it in a closed garage with the motor running (even five or ten minutes may be fatal); (3) do not sleep or park in it if the motor is running; (4) keep the motor tuned up in cold weather and the exhaust system tight."

Remember, too, that so long as ignorance and carelessness go hand in hand, carbon monoxid will continue to collect its appalling number of victims. — *Ohio Health News.*

What Every Woman Doesn't Know—How to Give Cod-Liver Oil.—Some authorities recommend that cod-liver oil be given in the morning and at bedtime when the stomach is empty, while others prefer to give it after meals in order not to retard gastric secretion. If the mother will

(Continued on Page 48)

PROVED DEFINITELY LESS IRRITATING . . .

Cigarettes made by the ordinary method of manufacture produce an irritation of the nose and throat that is noticeably absent when smoking Philip Morris.

Scientific research* shows that cigarettes in which diethylene glycol is used, are definitely less irritating—a major improvement in cigarettes.

In Philip Morris diethylene glycol is used exclusively as the hygroscopic agent.

CAL

Colfax School for the Tuberculous

COLFAX, CALIFORNIA

There are two units, The Colfax Hospital and the Bushnell Sanatorium, for the treatment of Pulmonary Tuberculosis.

The Colfax School for the Tuberculous is located in the pine clad Sierra Nevada foothills, at an elevation of 2400 feet; an elevation free from the fogs of the valleys and free from extremes of heat or cold.

This Institution supplies, among other advantages:—

1. Individual care and supervision under skilled physicians.
2. Education as to the essentials of recovery from, and the prevention of the spread of, disease.
3. Complete laboratory and x-ray equipment.
4. Every proved method of treatment, including pneumothorax and phrenic nerve interruption. (Major thoracic surgery referred to skilled thoracic surgeons.)
5. An absence of institutional atmosphere.
6. Reasonable rates.

For further information write

place the very young baby on her lap and hold the child's mouth open by gently pressing the cheeks together between her thumb and fingers while she administers the oil, all of it will be taken. The infant soon becomes accustomed to taking the oil without having its mouth held open. It is most important that the mother administer the oil in a matter-of-fact manner, without apology or expression of sympathy.

If given cold, cod-liver oil has little taste, for the cold tends to paralyze momentarily the gustatory nerves. As any "taste" is largely a metallic one from the silver or silverplated spoon (particularly if the plating is worn), a glass spoon has an advantage.

On account of its higher potency in vitamins A and D, Mead's Cod-Liver Oil Fortified With Percomorph Liver Oil may be given in one-third the ordinary cod-liver oil dosage, and is particularly desirable in cases of fat intolerance.

We wish to know what is going on; what the progress of science is; what leaders of the nations are doing; how our civilization is faring; and whether our community is what it should be. Though the matters to be dealt with are multifarious, one thing comforts us: only a people rich in culture has a wealth of problems. Nations that have slipped backward have been governed too little by what they knew or might have known, too much by indifference or superstition. Great changes swept over them before they realized what was happening. We wish to be alive to our country's needs and play a part in meeting them. We aspire to be free, realizing that freedom in our world of dense population is no longer a by-product of vacant lands, but a cultural achievement.

If we are to make any progress in highway safety, we can no longer permit any and everyone who may so wish to take a car on the road.

The swaddled infant pictured at right is one of the famous works in terra cotta exquisitely modeled by the fifteenth century Italian sculptor, Andrea della Robbia. In that day infants were bandaged from birth to preserve the symmetry of their bodies, but still the gibbous spine and distorted limbs of severe rickets often made their appearance.

A bambino from the Foundling Hospital, Florence, Italy,—A. della Robbia

Glisson, writing in 1671, described an ingenious use of swaddling bands — "first crossing the Brest and coming under the Armpits, then about the Head and under the Chin and then receiving the hands by two handles, so that it is a pleasure to see the Child hanging pendulous in the Air . . . This kind of Excercise . . . helpeth to restore the crooked Bones. . . ."

STRAPPED FOR RICKETS

SWADDLING was practised down through the centuries, from Biblical times to Glisson's day, in the vain hope that it would prevent the deformities of rickets. Even in sunny Italy swaddling was a prevailing custom, recommended by that early pediatrician, Soranus of Ephesus, who discoursed on "Why the Majority of Roman Children are Distorted."

"This is observed to happen more in the neighborhood of Rome than in other places," he wrote. "If no one oversees the infant's movements, his limbs do in the generality of cases become twisted. . . . Hence, when he first begins to sit he must be propped by swathings of bandages. . . ." Hundreds of years later swaddling was still prevalent in Italy, as attested by the sculptures of the della Robbias and their contemporaries. For infants who were strong Glisson suggested placing "Leaden Shooes" on their feet and suspending them with swaddling bands in mid-air.

How amazed the ancients would have been to know that bones can be helped to grow straight simply by internal administration of a few drops of Oleum Percomorphum. What to them would have been a miracle has become a commonplace of science. Because it can be administered in drop dosage, Oleum Percomorphum is especially suitable for young and premature infants, who are most susceptible to rickets. Its vitamins A and D derived from natural sources, this product has 100 times the potency of cod liver oil.* Important also to your patients, Oleum Percomorphum is an economical antiricketic.

Oleum Percomorphum offers not less than 60,000 U.S.P. vitamin A units and 8,500 U.S.P. vitamin D units per gram. Supplied in 10 and 50 c.c. bottles, also in boxes of 25 and 100 ten-drop soluble gelatin capsules containing not less than 13,300 vitamin A units and 1,850 vitamin D units (equal to more than 5 teaspoonfuls of cod liver oil*).

Effective therapy for—

PERNICIOUS ANEMIA

WITH SMALL DOSES AT RELATIVELY LONG INTERVALS

PERNICIOUS ANEMIA THERAPY, since it involves continued treatment at definite intervals, must consider the discomfort and inconvenience caused by the injection of the liver extract.

This discomfort and inconvenience is reduced to a minimum by the use of "1 cc. Concentrated Solution Liver Extract (Parenteral) *Lederle,*" which offers:

—a high degree of therapeutic effectiveness;

—a small volume for each injection;

—relatively long intervals (7 to 20 or more days) between injections.

PACKAGES

Available only in boxes of 3—1 cc. vials.

Lyell C. Kinney (Vice-Chairman)	San Diego	1940
Otto H. Pflueger (Secretary)	San Francisco	1940

Communications for the Cancer Commission should be addressed to the secretary, Otto H. Pflueger, M. D., Room 2004, 450 Sutter Street, San Francisco.

(Roster lists of officers of scientific section, component county societies, Woman's Auxiliary, A. M. A. delegates, special committees, etc., are continued on advertising pages 4 and 6.)

LIVERMORE SANITARIUM

• The Hydropathic Department devoted to the treatment of general diseases excluding surgical and acute infectious cases. Special attention given functional and organic nervous diseases. A well equipped clinical laboratory and modern X-ray Department are in use for diagnosis.

• The Cottage Department (for mental patients) has its own facilities for hydropathic and other treatments. It consists of small cottages with homelike surroundings, permitting the segregation of patients in accordance with the type of psychosis. Also bungalows for individual patients, offering the highest class of accommodation with privacy and comfort.

GENERAL FEATURES

1. Climatic advantages not excelled in United States. Beautiful grounds and attractive surrounding country.
2. Indoor and outdoor gymnastics under the charge of an athletic director. An excellent Occupational Department.
3. A resident medical staff. A large and well trained nursing staff so that each patient is given careful individual attention.

Protamine Zinc Insulin (Squibb).—Physicians will be interested to know that Protamine Zinc Insulin (Squibb) is now available in two strengths, 10 cc. vials of 40 units per cc. and 10 cc. vials of 80 units per cc.

Protamine Zinc Insulin has been available in the 40-unit strength since February 1, 1937. It was felt, however, that a higher potency was also needed for the many diabetics who require large amounts of insulin daily.

While the efficiency of the two strengths of Protamine Zinc Insulin may be identical, the transfer of a patient from one strength to the other should be made only under the careful supervision of a physician until more experience has been accumulated.

Protamine Zinc Insulin (Squibb) is marketed under license from the Insulin Committee, University of Toronto.

In arthritis, heavy massage and vigorous stretching and pulling of joints are absolutely harmful and should never be done.

ISOPHRIN

TRADE MARK REG. CALIF.

A non-irritating Neo-Synephrin Solution used as a nasal spray or drops

ISOPHRIN is ¼% Neo-Synephrin Hydrochloride in a special isotonic solution prepared only by Broemmel Laboratories.

Neo-Synephrin Hydrochloride is a synthetic substance of epinephrine-like action, but possesses the advantage that it is more stable, its effects are prolonged, and it does not irritate the nasal mucosa or cause sneezing.

Prolonged contact with certain metals may cause discoloration, therefore use spray bottles with only glass or hard rubber fittings.

Supplied in original bottles of 1 oz.

President, G. Wendell Olson, 211 No. Pomona St., Fullerton.

Secretary, Glenn Curtis, 323 So. Pomona Street, Brea.

Meeting, *First Tuesday, 8 p. m., Chapel of the Orange County Hospital, Orange.*

Placer County Medical Society

President, C. Ettrick Lewis, 59 Lincoln Ave., Auburn.

Secretary, Robert A. Peers, Colfax.

Meeting, *At Call of President.*

Riverside County Medical Society

President, D. D. Roos, Corona.

Secretary, Thomas A. Card, 3616 Main Street, Riverside.

Meeting, *Second Monday, 8 p. m., Library, Riverside Community Hospital.*

Sacramento Society for Medical Improvement

President, Dave Dozier, California State Life Building, Sacramento.

Secretary, Glenn E. Millar, 321 Physicians Building, Sacramento.

Meeting, *Third Tuesday, 8:30 p. m., Auditorium, Sacramento.*

San Benito County Medical Society

President, L. C. Hull, Hollister.

Secretary, L. E. Smith, Hollister.

Meeting, *At Call of President.*

San Bernardino County Medical Society

President, Delbert B. Williams, 401 North Eighth Street, Colton.

Secretary, A. E. Varden, Medico-Dental Building, San Bernardino.

Meeting, *First Tuesday, 8 p. m., San Bernardino County Charity Hospital.*

San Diego County Medical Society
Fourteenth Floor, Medico-Dental Building, 233 A Street, San Diego

President, Bryant R. Simpson, 1205 Medico-Dental Building, San Diego.

Secretary, W. H. Newman, Medico-Dental Building, San Diego.

Meeting, *Second Tuesday, El Cortez Hotel.*

San Francisco County Medical Society
2180 Washington Street, San Francisco

President, William C. Voorsanger, 490 Post St., San Francisco.

Secretary, Stanley H. Mentzer, 2180 Washington Street, San Francisco.

Meetings, *Every Tuesday, 8:15 p. m., 2180 Washington Street, San Francisco.*

San Joaquin County Medical Society

President, A. C. Boehmer, Box 306, Lodi.

Secretary, George H. Rohrbacher, Medico-Dental Building, Stockton.

Meeting, *First Thursday, 8:15 p. m., Medico-Dental Club Rooms, Stockton.*

San Luis Obispo County Medical Society

President, Frederick R. Mugler, 1170 Marsh Street, San Luis Obispo.

Secretary, E. D. Anderson, 1120 Morro Street, San Luis Obispo.

Meeting, *Third Saturday, 6:30 p. m., Mulholland's Grill, San Luis Obispo.*

San Mateo County Medical Society

President, Hartzell H. Ray, 23 Second Avenue, San Mateo.

Secretary, J. Garwood Bridgman, 205 Third Avenue, San Mateo.

Meeting, *Fourth Wednesday, Benjamin Franklin Hotel, San Mateo.*

Santa Barbara County Medical Society

President, E. J. Lamb, 1515 State Street, Santa Barbara.

Secretary, J. Jerome Rupp, 16 E. Junipero Street, Santa Barbara.

Meeting, *Second Monday, Cottage Hospital.*

Santa Clara County Medical Society

President, E. O. G. Schmitt, 608 Medico Dental Bldg., San Jose.

Secretary, Leslie B. Magoon, Medico-Dental Building, San Jose.

Meeting, *Third Wednesday, 8 p. m., Medico-Dental Building, San Jose.*

Santa Cruz County Medical Society

President, Dean S. Woodard, Stoesser Bldg., Watsonville.

Secretary, Samuel B. Randall, Farmers and Merchants Bank Building, Santa Cruz.

Meeting, *Second Tuesday, 7:30 p. m., Hotel Rio del Mar, Aptos.*

Shasta County Medical Society

President, Mathew D. Pratt, Fall River Mills.

Secretary, Leslie J. Seeley, 1432 York Street, Redding.

Meeting, *Second Monday.*

Siskiyou County Medical Society

President, E. F. Carlson, Fort Jones.

Secretary, Victor W. Hart, 113 No. Oregon Street, Yreka.

Meeting, *Second Sunday.*

Solano County Medical Society

President, Ream S. Leachman, 727 Sonoma St., Vallejo.

Secretary, John W. Green, Box 539, Vallejo.

Meeting, *Second Tuesday, 8 p. m., Casa de Vallejo Hotel, Vallejo.*

Sonoma County Medical Society

President, Alfred A. Thurlow, 505 B St., Santa Rosa.

Secretary, C. M. Carlson, 534 B Street, Santa Rosa.

Meeting, *Second Thursday.*

Stanislaus County Medical Society

President, Joseph L. Azevedo, Jr., 1024 "J" Street, Modesto.

Secretary, Hoyt R. Gant, 401 Beaty Building, Modesto.

Meeting, *Second Friday.*

Tehama County Medical Society

President, Donald E. Thompson, Red Bluff.

Secretary, F. J. Bailey, Red Bluff.

Meeting, *At Call of President.*

Tulare County Medical Society

President, J. C. McClure, Lindsay.

Secretary, Karl F. Weiss, Security First National Bank Building, Visalia.

Meeting, *Sunday Evening once a month.*

Ventura County Medical Society

President, Grundy C. Coffey, Bank of America Building, Ventura.

Secretary, A. A. Morrison, 625 Main Street, Santa Paula.

Meeting, *Second Tuesday, Ventura County Country Club.*

Yolo-Colusa-Glenn County Medical Society

President, Charles S. Roller, Woodland Clinic, Woodland.

Secretary, W. J. Blevins, Jr., Woodland.

Meeting, *First Tuesday.*

Yuba-Sutter County Medical Society

President, Neal M. Loomis, Yuba City.

Secretary, Fred W. Didier, Wheatland.

Meeting, *Second Tuesday.*

(Roster lists continued on advertising page 6)

VITAMIN-A EFFICACY

. . . proved in the laboratory

Carefully controlled biological tests have proved that the vitamin-A efficacy of cod liver oil is enhanced twofold when it is emulsified with Maltine. MALTINE WITH COD LIVER OIL, therefore, offers the physician not only an ideal vehicle for prescribing the vitamins A and D of cod liver oil, but also the added advantage of the valuable constituents of Maltine itself. Another feature of MALTINE WITH COD LIVER OIL is that it has none of the unpleasant oily consistency and taste usually associated with vitamin-bearing oil. This lack of taste is of particular advantage when prescribing for children.

Another preparation favored by physicians is MALTINE WITH COD LIVER OIL and IRON IODIDE, containing two grains of freshly prepared iron iodide per fluid ounce. The Maltine Co., 60 Hudson St., New York City.

SERVICE Luzier's

It is our conviction that cosmetics should be selected to suit the individual's requirements. We cater exclusively to you, the individual. Our representatives are trained to help you select suitable beauty preparations and to show you how to apply them.

It is only sensible to realize that a truly beautiful skin is first of all a healthy skin and secondly a well-cared-for skin.

Cosmetics serve to enhance your appearance, to present you at your best. In this regard it is well to bear in mind that a natural appearance is by far the most charming.

Carefully selected, and artistically applied, make-up preparations lose their identity as cosmetics and become an indistinguishable part of your personality.

We want it clearly understood that we in no way undertake to treat skin disorders. If you are thus afflicted we had rather that you not use our preparations without the consent of a skin specialist. Our formulary is available to the medical profession.

A card addressed to us will be referred to the manager of the territory in which you reside. It is our pleasure to be at your service.—LUZIER'S, Inc.

OPERATIVE GYNECOLOGY

By

H. S. CROSSEN, M.D., F.A.C.S.,

Professor of Clinical Gynecology, Washington University School of Medicine; and

R. J. CROSSEN, M.D.,

Assistant Professor of Clinical Gynecology and Obstetrics, Washington University School of Medicine.

REARRANGED, REWRITTEN, BROUGHT UP-TO-DATE

The six years since the last edition of this work constitute a period of unusual activity in searching out the fundamentals of gynecologic physiology and structure, and in applying such knowledge to the cure of diseased conditions. This intensive study has extended also to our therapeutic resources—old and new, medical and surgical—giving a much better understanding of their possibilities and limitations. This NEW FIFTH EDITION has been extensively rearranged and rewritten to cover this new knowledge. The main object of the book continues to be: To push the fight against disease by presenting the advances of surgery as applied to the relief of gynecologic diseases in a way which will give practical aid to the surgeon seeking help on these problems. Two hundred new illustrations have been used.

NEW 5TH EDITION

1076 Pages, 1262 Illustrations » Price $12.50

Selective Treatment the Keynote of "OPERATIVE GYNECOLOGY"

Devoted exclusively to Operative Treatment, this book presents fully: (1) The Technique of All Operations. (2) Difficulties Likely to Be Encountered. (3) Indications for Operation in Various Diseases. (4) Selection of Exact Form of Operative Procedure Best Suited for the Particular Case.

Carrying out this idea, presentation is made of the various operations available for each disease and then consideration is given to the selection of the particular operation best suited to each type of that disease. In trying to do the very best for the patient, careful consideration must be given to the following points:

IS OPERATION NEEDED?

To answer this question one must have a comprehensive knowledge of gynecological pathology and of the various nonoperative measures by which the pathological conditions may be modified. Before advising operation for any patient, the surgeon must be certain that the risk of operation is fully justified by the conditions present; that is, that the conditions are serious enough to warrant the risk of operation and that they cannot be removed or sufficiently modified by nonoperative measures.

WHAT OPERATION SHOULD BE SELECTED?

In conditions requiring operative treatment, the selection of the type of operation should be given earnest thought. This should be based on three considerations: (a) removal of effective palliation of the lesions, (b) minimum danger to the patient, and (c) preservation of function. Conservation of function should be a major study with any one doing pelvic surgery. Our work is not to destroy function, but to preserve it as far as conditions will permit.

BEFORE AND AFTER OPERATION

Advances in internal medicine have made very definite improvements in the preoperative examination and preparation of patients, particularly in the estimation of reserve in vital functions and in the preparation of patients with certain handicaps. The after-care in serious operative work with the handling of complications has been revolutionized with the result that many patients are now saved who would formerly have been lost. The conscientious surgeon will take the time and labor and expense to surround his patients with these safeguards.

FROM PREFACE TO NEW 5th EDITION

In conformity with the established relative importance of the various genital organs, we start with the most important, namely, the ovaries. In applying the new knowledge to the relief of diseases of the genital organs, we have held to the idea of selective treatment as emphasized in previous editions—that is, the selection of the operative measure most suitable for the particular modifying conditions present in that patient, instead of trying to apply one operation to all cases of a lesion regardless of type and details. In this direction of individual study and adaptation lie increased effectiveness of relief and greater permanence of results.

$3.00 A MONTH!—The Fifth Edition of "OPERATIVE GYNECOLOGY" is yours for only $3.00 a month. Use the coupon below to order your copy. The first monthly payment of $3.00 is due 30 days from the date of shipment.

COÖPERATE WITH YOUR ADVERTISERS

CALIFORNIA AND WESTERN MEDICINE, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention CALIFORNIA AND WESTERN MEDICINE.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this JOURNAL to members and readers.

A SERVICE AGENCY—FOR READERS

THE JOURNAL of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California Medical Association. The Cooperative Bureau is equipped with catalogues and price lists of manufacturers. and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in CALIFORNIA AND WESTERN MEDICINE, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. CALIFORNIA AND WESTERN MEDICINE and the A. M. A. Service Bureau desire to serve *you*.

5 REASONS FOR AN AGENCY ACCOUNT

Our Agency Service has five outstanding advantages for anyone having a sizable investment portfolio:

1. It relieves the client of all bookkeeping details and annoying routine.
2. It prevents losses due to mistakes, to delays in depositing dividends and collecting interest, to failure to observe redemption notices, etc.
3. It provides records helpful in preparing tax returns.
4. Its cost is moderate — frequently it pays for itself.
5. Flexible, it is adapted to the client's individual needs and operates under his direct authority.

Recent Statement by the Judges of the Mead Johnson Vitamin A Award.—"The Vitamin A Award offered by Mead Johnson & Company was supposed to be made on the basis of papers published or accepted for publication by December 31, 1936. The judges of this award, meeting in New York, June 4, 1937, feel that its presentation at this time is not warranted, since no clinical investigation on vitamin A has yet been published which completely answers any of the objectives of the original proposal. The judges, therefore, agreed to defer further consideration of the granting of this award until December 31, 1939. This action was taken because of the existence of pronounced differences of opinion among investigators as to the reliability of any method yet proposed for determining the actual vitamin A requirements."

Comment by Mead Johnson & Company: In view of this action by the judges of the Mead Johnson Vitamin A Award, and as an earnest of our good faith in the matter, we have segregated from our corporate funds on deposit with the Continental Illinois National Bank & Trust Company of Chicago the sum of $15,000. This cash deposit has been placed in escrow and will be paid promptly when the board of judges decides on the recipient of the Main or Clinical Award. The Laboratory Award of $5,000 was made on April 10, 1935.

Serum Treatment of Croupous Pneumonia.—Nissen states that the mortality in seventy-four cases of croupous pneumonia treated in 1934 and 1935 was 41.9 per cent. During the following eighteen months one hundred patients were treated; ten, or 16.9 per cent, of the fifty-nine given serum treatment died; twenty-three, or 56.9 per cent, of the forty-one who received no serum died. He considers it justifiable to treat every patient presenting croupous pneumonia with type I serum immediately on admission and until type determination is made, when treatment with type-specific serum should be continued.—*Ugeskrift for Laeger.*

Colds... Rhinitis

3 Ways

of Bringing Relief with

NEO-SYNEPHRIN

HYDROCHLORIDE

(laevo-alpha-hydroxy-beta-methyl-amino-3-hydroxy ethylbenzene hydrochloride)

For quick and safe relief of nasal congestion in *colds, sinusitis, rhinitis,* the use of the vasoconstrictor, Neo-Synephrin Hydrochloride in *Solution, Emulsion, Jelly,* offers these advantages:

1. No sting
2. More sustained action than epinephrine or ephedrine
3. Less toxic in therapeutic dosage than epinephrine or ephedrine
4. So stable that it may be sterilized by boiling
5. In dosage recommended Neo-Synephrin does not usually produce "nervousness" or insomnia

FOR ACUTE HYPOTENSION

(Due to Shock or Anesthesia, Especially Spinal)

Recent research shows that subcutaneous administration of Neo-Synephrin Hydrochloride is of definite clinical value in the above conditions. The pressor action usually lasts from one to two hours.

Neo-Synephrin may be repeatedly administered without an appreciable decrease in pressor effect—in sharp contrast to ephedrine which, if repeatedly injected, may be followed by a decrease, disappearance or reversal of pressor action.

Supplied for this purpose in rubber-capped vials containing 15-cc of a sterile 1% solution.

For Office Treatments and for Follow-Up in the Home

Neo-Synephrin can be used equally well *either for adults or children.*

Whether you prefer dropper, spray or jelly there is a corresponding dosage form adapted to your technic in the office and suitable for follow-up by your patient in the home.

These dosage forms are:

NEO-SYNEPHRIN Hydrochloride SOLUTION ¼%

This concentration is usually sufficient to relieve congestion when applied by spray or dropper. (Supplied in 1-oz. bottles)

1%—The higher concentration may be necessary to relieve extreme congestion, by dropper, spray or cotton applicator. (Supplied in 1-oz. bottles)

NEO-SYNEPHRIN Hydrochloride EMULSION ¼%

The form recommended for dropper instillation. (Supplied in 1-oz. bottles)

NEO-SYNEPHRIN Hydrochloride JELLY ½%

Supplied in convenient nasal applicator tube.

The individual is not unlike the race. At first, as a wanderer, he tries ways and places; then, settling somewhere, he devotes himself to work. His best years are spent in making and doing. While long and faithful toil pays a man, yet upon occasion an "old hand" may wisely turn to something new. We form habits and so save energy; we do well, however, to stop short of being slaves of a habit. The world undergoes ceaseless change. We should, therefore, be on the alert to find out the meaning of what is happening around us and thereby assess the value of what we are doing. Thus, by continual learning we cope with change. Life for us moves swiftly; within recent decades it has become highly complex. To keep up with the times we must keep up our knowledge. Many watch the world rush by and take no pains to find out what the hubbub is about. Political ideals, the social order, methods of production and distribution, systems of finance, and many other things are undergoing change. Only those who study are not left behind by the onrolling globe.—Leon J. Richardson.

VISCEROPTOSIS SUPPORTS

After speaking of diet, exercise and medication in the treatment of visceroptosis, a writer* on visceroptosis continues as follows: "Supporting measures are the most important influences in correction, but the prescribed supportive corset or belt with its pads must be designed and constructed to remedy the actual faults found upon X-Ray examination . . . Important rules which must be followed are as follows: (a) The corset must first be adjusted while the patient is lying down . . . and the uppermost part of corset or belt must never be pulled tight, but must be worn just comfortably snug so the uplift will not be obstructed. (b) The corset or belt must be removed only during periods when patient is lying down."

A—Showing the stomach well below the crest of the ilium

B—Same patient after application of visceroptosis support

Camp surgical fitters are trained in our schools to observe the rules of the Doctors and to give proper instructions to the patients. Camp visceroptosis supports are always constructed with two strap adjustments in order to allow of the "comfortably snug" adjustment of the upper part of the support.

*CORCORAN, New York State Journal of Medicine, Jan. 1, 1930

AN IMPORTANT NEW WORK

CLINICAL ALLERGY

Due to

Foods, Inhalants, Contactants, Fungi, Bacteria and Other Causes

MANIFESTATIONS, DIAGNOSIS AND TREATMENT

By ALBERT H. ROWE, M.S., M.D.
Lecturer in Medicine in the University of California Medical School, San Francisco, California, etc.

Octavo, 812 pages. Cloth, $8.50, net.

This book embraces the entire field of clinical allergy, considering every recognized cause of hypersensitiveness. It includes the material of the author's previous work on food allergy, revised in the light of his later experience. It shows the true nature of allergy, the tissues involved, and the best ways of diagnosing them and treating them. Symptoms are fully described and extended menus for adults and children at various ages, and new general menus are included in the appendix.

BOOK REVIEWS

(Continued from Preceding Page)

Macleod's Physiology in Modern Medicine. Edited by Philip Bard. Cloth. Pp. 1050. Eighth Edition. Price, $8.50. St. Louis, Missouri: C. V. Mosby Company.

Professor Bard, with the collaboration of eight capable men, is "carrying on," and providing the profession with this valued text brought up to date in this eighth edition. The greater part of the book has been rewritten. Each major division is under the editorial supervision of an acknowledged authority.

The text is a guide to the clinical application of physiology and biochemistry. This clinical feature enhances the text and extends its contents to the clinician, a commendable purpose. Laboratory findings are brought to the bedside.

Every physician does well to secure, study, and consult this text daily. He will be a better physician for having done so.

TWENTY-FIVE YEARS AGO

(Continued from Text Page 152)

shall leave it untouched. Malignant growths are almost the only ones found in the esophagus; their removal belongs to general surgery.

In discussing the removal of foreign bodies, I suppose some mention should be made of the older and well-known methods. But I shall give very little time to this part of the subject, for I believe that those older methods are so blind and uncertain and dangerous that they should be discarded in practically every case where esophagoscopy is available. The number of men employing esophagoscopy is increasing rapidly, so that in the near future this means of relief will be available in nearly all parts of the country. And while time is very important in these cases, it will frequently mean less danger to the patient to take the time necessary to reach an esophagoscopist than to try to remove the foreign body by the old means.

(Continued on Page 19)

Why Special Morning Milk?

VITAMIN A
2000 U. S. P. Units added
per tall can (13 fluid ounces)

VITAMIN D
400 U. S. P. Units added
per tall can (13 fluid ounces)

You undoubtedly supplement your infant feeding formulas with an antirachitic. But are you sure that your instructions are carried out? Various causes may prevent the infant from receiving an adequate daily intake of vitamin D. The mother may forget, or she may feel the family budget cannot afford it, or the infant may refuse to take the dosage. By prescribing Special Morning Milk you are assured that the child will receive at least 31 U. S. P. units of vitamin D per fluid ounce of milk taken or a total of 400 U.S.P. units of vitamin D when one tall can (13 fluid ounces) is consumed. Special Morning Milk therefore offers a convenient, economical and pleasant way of including the vitamins A and D of cod liver oil in the infant's daily diet.

- THE VITAMIN D ADDED PER TALL (13 FLUID OZ.) CAN REPRESENTS THE AMOUNT IN 1¼ TEASPOONS OF U.S.P. COD LIVER OIL (315 UNITS PER TEASPOON).
- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA USING COD LIVER OIL CONCENTRATE AS ITS SOURCE OF VITAMIN D.
- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA TO WHICH HAS BEEN ADDED 400 U.S.P. UNITS PER TALL (13 FLUID OUNCES) CAN.

No Cod Liver Oil taste in the Milk!

PRESCRIPTION FOR YOU

More and more doctors are finding out that a winter week or two away from work means even more in needed relaxation than their usual summer vacations. Indeed, within a few short hours' drive you may find yourself a million miles away from care . . . in the 20,000 acre sports reserve that spreads out from Hotel Del Monte. No need to make a reservation; just hop in your car (with your golf clubs) and come. Modest American plan rates make a glorious holiday cost no more than just staying home.

DEL MONTE

America's Greatest Resort

TWENTY-FIVE YEARS AGO

(Continued from Page 16)

From an article on "Gasserectomy," with Report of Three Cases, by J. Henry Barbat, M.D., San Francisco.—These cases are reported on account of the unpleasant complications encountered during operation. We are struck by the fact that this operation, when performed on the cadaver is very easy of accomplishment, but on the living body we are confronted with the one thing which makes intracranial surgery extremely difficult and at times fatal, and that is hemorrhage. . . .

From an article on "Tuberculosis Among Railroad Employees," by John C. King, M.D., Banning.—Tuberculosis is ubiquitous, therefore railroad employees suffer from it. The percentage of morbidity is probably less among them than among any other large mass of employees, except those in the army and navy. They are obliged to submit to physical examination prior to employment. Life insurance actuaries claim that examination discriminates in favor of the company for a period not to exceed five years. Likewise, the examination of our men protects the company for only a limited though uncertain time. . . .

From some Society Reports:

Alameda County.—The annual meeting of the Alameda County Medical Association was called to order by the president, W. A. Clark, at the Young Men's Christian Association Building, Tuesday evening, December 17, 1912, at 8:30 o'clock.

The election of officers, councilors, delegates and alternates resulted as follows:

President, Dr. M. L. Emerson; Vice-President, Dr. Dudley Smith; Secretary-Treasurer, Dr. Elmer E. Brinckerhoff; Councilors, Drs. N. H. Chamberlain, J. A. Ellis, W. H. Irwin, C. W. Page, Alvin Powell, G. G. Reinle; Delegates, Drs. Elmer E. Brinckerhoff, T. J. Clark, W. A.

THE DRINK THAT FEEDS NURSING MOTHERS AND PREGNANT WOMEN

The special food aid which Cocomalt brings during lactation and pregnancy has found favor with physicians everywhere. Precision manufacture and purity-sealed cans insure that a measured amount of Calcium, Phosphorus, Vitamin D, Iron and other food essentials is delivered in each ounce-serving of Cocomalt.

	1 Ounce of Cocomalt adds	1 Glass of Milk (8 Liquid Ozs.) contains	Thus, 1 Glass of Cocomalt and milk contains
†IRON	0.005 GRAM	*TRACE	0.005 GRAM
†VITAMIN D	134 U.S.P. UNITS	*SMALL AMOUNT; VARIABLE	134 U.S.P. UNITS
†CALCIUM	0.15 GRAM	0.24 GRAM	0.39 GRAM
†PHOSPHORUS	0.16 "	0.17 "	0.33 "
PROTEIN	4.00 GRAMS	7.92 GRAMS	11.92 GRAMS
FAT	1.25 "	8.53 "	9.78 "
CARBOHYDRATES	21.50 "	10.97 "	32.47 "

★ *Normally Iron and Vitamin D are present in Milk in only very small and variable amounts.*

† *Cocomalt, the protective food drink,* is fortified *with these amounts of Calcium, Phosphorus, Iron and Vitamin D.*

Thus, since each ounce-serving of Cocomalt has been *fortified* with .15 gram of Calcium, .16 gram of Phosphorus, an 8-oz. glass of milk with 1-oz. of Cocomalt provides .39 gram of Calcium, .33 gram of Phosphorus. And, helping insure that the system can utilize these food-minerals, each ounce of Cocomalt also contains 134 U.S.P. Units of Vitamin D, derived from natural oils and biologically tested for potency. The 5 milligrams of effective Iron in each ounce of Cocomalt are biologically tested for assimilation.

The creamy, delicious flavor of either Hot or Cold Cocomalt appeals to old and young alike. Inexpensive, Cocomalt is for sale in purity-sealed cans at grocery and drug stores in ½-lb., 1-lb. and the economical 5-lb. hospital size.

Cocomalt is the registered trade-mark of R. B. Davis Co., Hoboken, N. J.

It Can Happen Here

Example of severe rickets in a sunny clime. Courtesy of E. H. Christopherson, M.D., San Diego, and of "California and Western Medicine."

LEST WE FORGET—we who are of the vitamin D era—severe rickets is not yet eradicated, and moderate and mild rickets are still prevalent. Here is a white child, supposedly well fed, if judged by weight alone, a farm child apparently living out of doors a good deal. This boy was reared in a state having a latitude between 37° and 42°, where the average amount of fall and winter sunshine is *equal to that in the major portion of the United States*. And yet such stigmata of rickets as *genu varum* and the quadratic head are plain evidence that rickets does occur under these conditions.

How much more likely, then, that rickets will develop among city-bred children who live under a smokepall for a large part of each year. True, vitamin D is more or less routinely prescribed nowadays for infants. But is the antiricketic routinely administered in the home? Does the child refuse it? Is it given in some unstandardized form, purchased from a false sense of economy because the physician did not specify the kind?

A uniformly potent source of vitamin D such as Oleum Percomorphum, administered regularly in proper dosage, can do more than protect against the gross visible deformities of rickets. It may prevent hidden but nonetheless serious malformations of the chest and the pelvis and will aid in promoting good dentition. Because the dosage is measured in *drops*, Oleum Percomorphum is well taken and well tolerated by infants and growing children. Rigid bioassays assure a uniform potency—100 times the vitamins A and D content of cod liver oil*. Oleum Percomorphum, moreover, is a natural product in which the vitamins are in the same ratio as in cod liver oil*.

*U.S.P. Minimum Standard

Oleum Percomorphum offers not less than 60,000 vitamin A units and 8,500 vitamin D units (U. S.P.) per gram. Supplied in 10 and 50 c. c. brown bottles, also in 10-drop soluble gelatin capsules, each offering not less than 13,300 vitamin A units and 1,850 vitamin D units, in boxes of 25 and 100.

ing the continued increase in membership, and the inauguration of the medical office building proposition.

Membership.—The total number of members for whom we paid assessments to our State Society was six hundred.

It will not be out of place to again give here, as a matter of record, the total membership of the Los Angeles County Medical Association during the last several years.

In year 1905, total membership was 315 members.

In year 1906, total membership was 359 members, gain 44 members.

In year 1907, total membership was 393 members, gain 34 members.

In year 1908, total membership was 398 members, gain 5 members.

In year 1909, total membership was 402 members, gain 4 members.

In year 1910, total membership was 457 members, gain 4 members.

In year 1911, total membership was 561 members, gain 104 members.

In year 1912, total membership is 600 members, gain 39 members.

It is evident from the above figures that the Association is continuing its steady progress as regards increase of its membership.

Report of Board on Permanent Quarters.—Mr. President and Members of the Los Angeles County Medical Association:

The first annual report of this Board was printed in the *Bulletin* of January 5, 1912, and showed a balance on hand of $9,677.61.

Of the above amount $819.72 represented the savings of our Society up to the time of the Los Angeles meeting of the American Medical Association in 1911, and the balance of $8,857.89 was what was left of the entertainment fund when all the debts of the American Medical Association meeting had been paid.

The Board of Permanent Quarters, after careful consideration and with the consent of the Board of Councilors, purchased in the name of the Los Angeles County Medical Association, an option on the splendidly located lot at the southeast corner of Sixth and Olive streets owned by Mr. H. W. Spiers.

The Board of Permanent Quarters, therefore, makes an appeal to each and every member of the Association to lend a hand in what can be made and what we hope will be, the biggest and most successful enterprise our Society has ever undertaken.

Respectfully submitted,

H. Bert Ellis, *Chairman,*
Baard of Permanent Quarters.

✦ ✦ ✦

Annual Meeting, San Francisco County Medical Saciety, December 10, 1912.—Presidential address by Dudley Tait:

Fellow Members:

I wish, first of all, to thank you for the honor, which I esteem so highly, of having been permitted to preside at your meetings and to address you tonight.

During the past year the policy of the San Francisco County Medical Society, as outlined by your directors, your inspiring and indefatigable secretary, and serious-minded committees, had but one single aim: the strengthening of the Society as a factor in the profession, as well as from the viewpoint of the public. . . .

Report of Secretary-Treasurer.—

Mr. President and Members of the San Francisco County Medical Society:

As Secretary I beg leave to submit the following report

(Continued on Page 24)

IN PEDIATRIC PRACTICE

It's Individualized Care

PROPERTIES OF KARO

Uniform composition
Well tolerated
Readily digested
Non-fermentable
Chemically dependable
Bacteriologically safe
*Non-allergic
Economical

*Free from protein likely to produce allergic manifestations.

•

COMPOSITION OF KARO

(Dry Basis)

Dextrin	50%
Maltose	23.2%
Dextrose	16%
Sucrose	6%
Invert sugar	4%
Minerals	0.8%

•

KARO EQUIVALENTS

1 oz. vol.	40 grams 120 cals.
1 oz. wt.	28 grams 90 cals.
1 teaspoon	15 cals.
1 tablespoon	60 cals.

Mothers want their babies treated as individuals, not as cases; their babies followed, not their charts; their physiques treated, not the labelled conditions; and the doctoring done economically.

When infant feeding materials prescribed are within the reach of every budget, mothers will appreciate the physician and the babies will thrive. Karo is the economical milk modifier. It costs 1/5 as much as expensive modifiers.

For further information, write
CORN PRODUCTS SALES COMPANY
Dept. SJ-2, 17 Battery Place, New York, N. Y.

★ Infant feeding practice is primarily the concern of the physician, therefore, Karo for infant feeding is advertised to the Medical Profession exclusively.

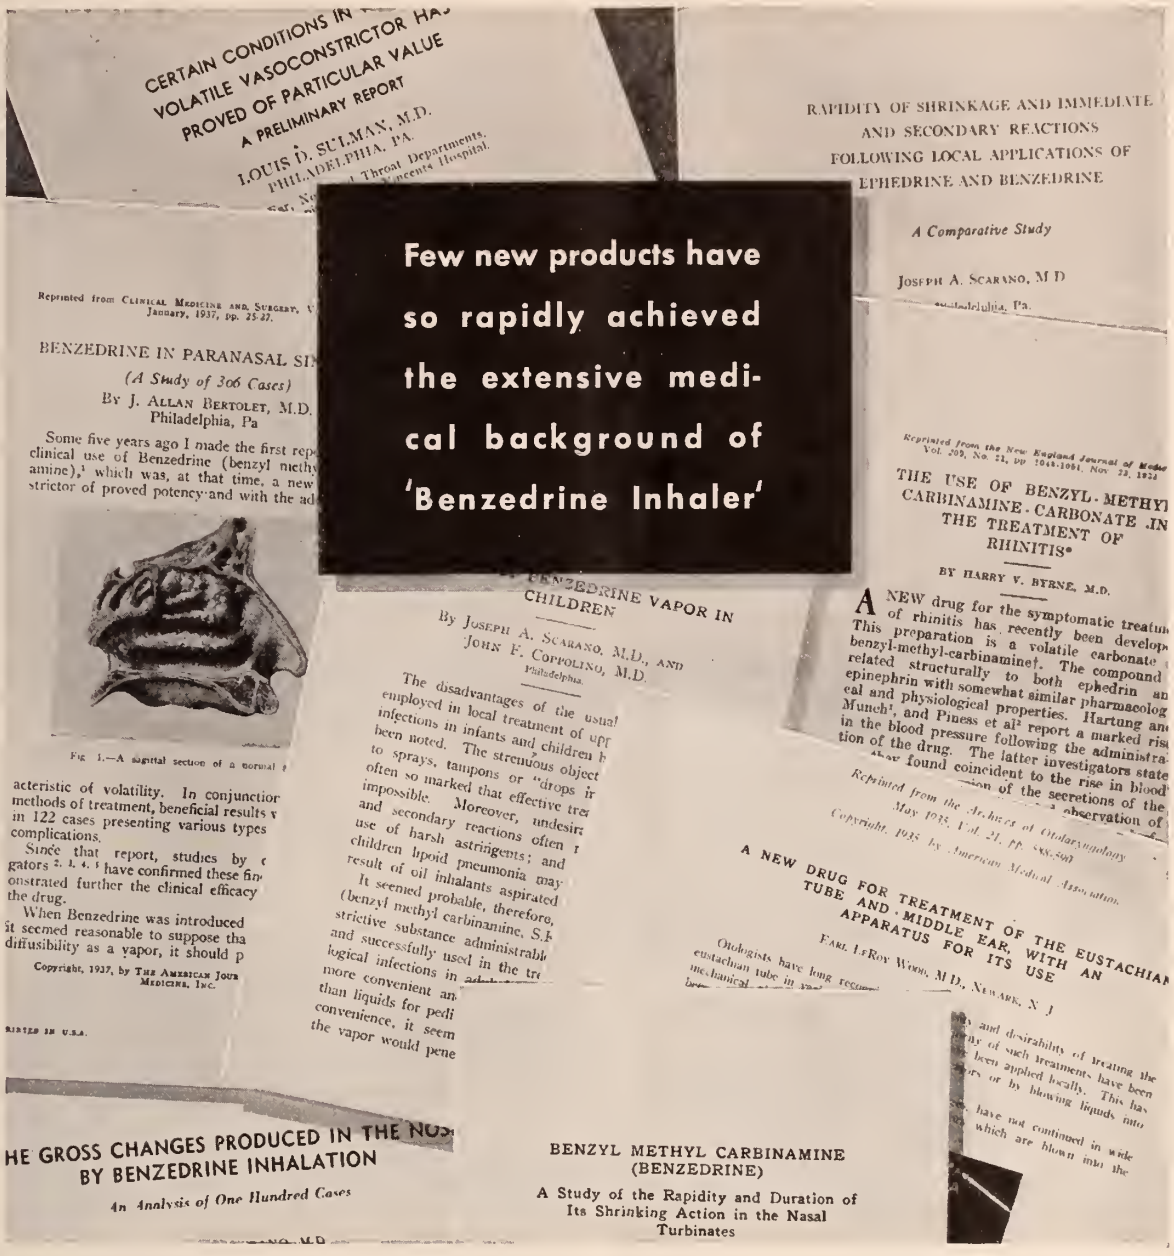
BOARD OF MEDICAL EXAMINERS



(Continued from Text Page 152)

"'I cannot forget the vivid picture of you breaking a man's arm. There is enough misery in this world without intentionally causing suffering.' It was Superior Judge Frank M. Smith speaking today as a jurist who has seen much of the cruelties of life. It was his comment as he sentenced Joe Bone, confessed 'brains' and 'bone crusher' in the half-million-dollar fifty-person 'fake accident ring,' to a term of one to ten years in San Quentin prison. 'There is no place in the world for a man like you except behind prison bars,' Judge Smith added. On a plea of guilty, Etta Hargett, twenty-seven, whose case launched the investigations which uncovered the fake accident ring, was given five years' probation, sixty days in jail, and a $250 fine as restitution for her portion of the $600 that was assertedly paid on a fake street-car accident claim. When he spoke of the 'vivid picture,' he was thinking of testimony in a case several weeks ago in which Peter De Nooy, prosecution witness, declared: 'I put my left arm across the blocks. Then Mr. Bone swung the club down on me, cracking my forearm. It felt terrible.' The gigantic fake accident ring assertedly victimized insurance companies by inducing persons to represent falsely that they had received injuries in automobile and street-car accidents. Nearly a half-million dollars was assertedly taken from insurance companies in such operations. Bone was sentenced only on a basis of allegations in connection with a 'fake' accident involving Mr. and Mrs. Bert Howard. Mrs. Howard is serving a jail sentence. Her husband was never apprehended. Bone may face other possible consecutive sentences. George O. Dorris, former street-car company adjuster and asserted co-leader with Bone in the plot, is facing sentence in another court. . . . Case of Louis Feinstein, attorney, under indictment in connection with asserted 'ambulance chasing,' was continued to January 24." (Los Angeles *Herald and Express,* December 16, 1937.)

"Dr. Louis Kameny, Oakland physician, and Emile Grossman, East Bay attorney, convicted on six counts of conspiracy to commit grand theft, will have another week's grace before sentence is pronounced. Tuesday Alameda County Superior Judge Lincoln S. Church postponed sentence until January 11 on the request of the county probation officer who requested the continuation to complete his investigation of the pair, who asked probation. They were engaged in an asserted 'insurance racket,' allegedly attempted to post-date an accident to defraud an insurance company." (San Francisco *Examiner,* January 6, 1938.)

"Raiding a palatial, twenty-room dwelling at 694 South Hobart Boulevard, police late yesterday arrested Dr. Paul C. Fowler (licensed chiropractor) on charges growing out of an alleged illegal operation. A patient of Doctor Fowler, Mrs. Lucille Winter, according to investigators, is near death in General Hospital as a result of the alleged operation. Two women, one being treated and another awaiting treatment for unknown ailments, were in the luxuriously

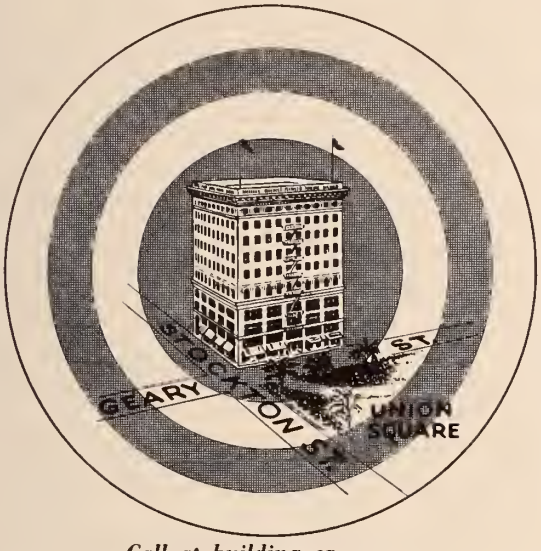
BOARD OF MEDICAL EXAMINERS



(Continued from Page 24)

furnished office in the well-equipped Wilshire district residence when the officers and an agent of the State Board of Medical Examiners entered. Scores of costly surgical instruments, a quantity of narcotics, and hypodermic paraphernalia were seized in the raid, led by W. N. Anderson, investigator for the State Medical Board, and Detective Lieutenants R. B. McCreadie and Frank R. Harper. They acted on a warrant charging Doctor Fowler with medical practice allegedly exceeding the scope of his chiropractor's license. . . ." (Los Angeles *Examiner*, January 6, 1938.) A photograph now in possession of the Board of Medical Examiners shows the above-mentioned array of instruments, which include uterine dilators, forceps, vaginal speculums, uterine curettes, irrigators, a large number of glass syringes of various sizes, also a sign reading "Dr. Paul C. Fowler, Diagnosis, Psychiatry—Dr. A. B. Carmichael, Physician and Surgeon." (Under jurisdiction of the Board of Osteopathic Examiners.) Said photograph also shows an open book wherein the title appears "Abortions" by Doctor Taussig. Investigator Walter N. Anderson, in his report of January 7, 1938, states that Chiropractor Fowler "was committed to jail in default of $1,000 bail. . . . At the time of the raid, two vials of morphin sulphate . . . were found in his possession." Said report also relates that "Fowler admitted . . . that prior to the disruption of the Rankin-Watts abortion ring, he referred abortion cases to them, and that many of the instruments (seen) in the picture (above referred to) Fowler stated were purchased from the well-known Doctor Watts. It is also interesting to note that Mrs. G. E. Watts's name appears in the daybook of Chiropractor Fowler. The name of Dr. St. John also appears in the same book. . . ." The records of the Board of Chiropractic Examiners show that Paul C. Fowler, a graduate of the Wentworth Chiropractic School, Duluth, Minnesota, June 1, 1920, holds chiropractic license No. 3033, issued March 8, 1930.

151 SUTTER STREET, SAN FRANCISCO

"A brief, consuming some 335 pages, and aimed at reversal of the conviction of Dr. Claude C. Long for the abortion death of a woman patient, was filed in the State Supreme Court yesterday. Principal charges in the lengthy document were that the physician was convicted on insufficient evidence. . . . Doctor Long was convicted of manslaughter last August by the same jury that acquitted his wife, Isabelle, and his office nurse, Mrs. Ann Fisher." (San Francisco *Chronicle*, January 1, 1938.)

"Tessie Sitton Noel, forty-nine, a nurse, was sentenced by Superior Judge Walter Desmond yesterday to two to five years in the Women's Prison at Tehachapi, the term prescribed by law, with the recommendation to the Prison Board that Mrs. Noel be kept there for the maximum sentence. The sentence was pronounced after the court had denied a plea for probation on one count of having performed an illegal operation. Two similar counts had been dismissed on motion of the District Attorney's office. 'The report of the probation officer in this case reveals a trail of murder,' said the court. 'The report indicates the guilt of the defendant on all three counts. I will say very definitely that if I had known there was a record of crime and murder, I would never have permitted the plea to one count. Therefore, of course, I am going to deny the application for probation and sentence the defendant to the penitentiary. . . .' Mrs. Noel, who claims to have been an ordained minister for twenty years as well as a nurse, and who on the occasion of her preliminary hearing threw the courtroom into an uproar with an outburst of religious shoutings, maintained her innocence to the last in spite of her previous plea of guilty. Mrs. Noel was arrested in September after an investigation by Detectives W. J. Sibley and R. H. Manchester had resulted in discovery of the body of a perfectly formed boy baby preserved in a jar of alcohol in a trunk which had been placed in storage by Mrs. Noel. The body of a second baby was found the next day in a suitcase found in a closet of an East Tenth Street

APPROVED CLINICAL PATHOLOGISTS

American Medical Association Essentials for An Approved Clinical Pathologist

An approved clinical pathologist should be a licensed graduate of medicine. He shall have specialized in clinical pathology, bacteriology, pathology, chemistry, and other allied subjects for at least three years, and he should be reasonably familiar with the manifestations of disease in the body. The director of a clinical laboratory shall be on full time or have definite hours of attendance, devoting the major part of his time to this specialty. A clinical laboratory is an institution organized for the practical application of the fundamental sciences by the use of specialized apparatus, equipment and methods, for the purpose of ascertaining the presence, nature, source, and progress of disease in the human body.

The following Clinical Pathologists directing private laboratories in California are approved by the Council on Medical Education and Hospitals of the American Medical Association:

Clinical Laboratory of Drs. W. V. Brem, A. H. Zeiler, Roy W. Hammack and G. D. Maner, 657 So. Westlake Avenue, Los Angeles, California.

Zera E. Bolin, M. D., 490 Post Street, San Francisco, California.

These laboratories use standard methods and are fully equipped to make all clinical examinations of recognized value in: **Tissue Pathology, Bacteriology, Hematology, Serology, Bio-Chemistry, Kolmer, Wassermann, Kahn test, Medico-legal, Basal metabolism, Blood chemistry, Hormone Test for Pregnancy, Parasitology, Cardiology, Autogenous vaccines, etc.**

Mailing containers sent on request. Special delivery postage insures prompt, accurate service.

THE POTTENGER SANATORIUM AND CLINIC

For Diseases of the Chest — **Monrovia, California**

AN INSTITUTION FOR DIAGNOSIS AND THERAPY

CHOICE rooms and bungalows at rates ranging from $35 per week up, including medical service, general nursing, x-rays, routine laboratory examinations, ordinary medicines and therapeutic pneumothorax.

A few accommodations as low as $25 per week assigned on special application in selected cases.

In the foothills of the Sierra Madre Mountains, thirty-five miles from the ocean. Surrounded by beautiful gardens.

Close medical supervision. Aside from tuberculosis, special attention is given to asthma, bronchiectasis, lung abscess and kindred diseases.

boarding house which had been formerly operated by Mrs. Noel. An operation victim told of the burial of another baby in the yard on Tenth Street, but the body never was found." (Long Beach *Sun*, December 30, 1937.)

"Just as they were about to go to trial, charged with performing an illegal operation on an Oakland woman, Mrs. Annabelle McLellan, widow of Dr. Gordon McLellan, Mrs. Lucille Bouton, nurse, pleaded guilty. Their admission of guilt was made in the courtroom of Judge E. J. Tyrrell just after a jury had been chosen for the trial and evidence was to be introduced. . . . Judge Tyrrell set next Monday as the day of sentence. Both women may be sentenced, under the law, to a maximum of three years for conspiracy to commit an illegal operation." (San Francisco *Chronicle*, January 6, 1938.)

"Signing 'Dr.' before his name while he was on probation for two counts of violation of the Medical Act resulted in J. David Dunlop being sentenced to six months in the county jail today by Justice of the Peace William E. Fox for violation of probation. Dunlop last appeared in the local justice court in May, 1936. At that time he was found guilty of practicing medicine without a license and placed on probation. He was instructed to leave the State and refrain from practicing medicine. Henri V. Nier, Hollywood physical director, was the complaining witness. A letter written to him by the defendant was presented as evidence. He told the court that when he checked with the State Medical Board to ascertain if 'Dr.' Dunlop was

(Continued on Page 30)

Those 25 Patients who can be saved

Of one hundred cases developing type I pneumonia, seventy will recover and five will die regardless of treatment. The remaining twenty-five will die without treatment, but can be saved by prompt administration of Antipneumococcic Serum, Felton.

Reports in recent medical literature have shown that the very early use of specific antipneumococcic serum is important. In a series of 160 type I pneumonia cases (R. L. Cecil J. A. M. A. 108:689, 1937) in which specific antiserum was given within twenty-four hours of onset, mortality was reduced to one-third the usual rate in serum-treated cases, and to one-sixth the average rate in cases not receiving serum.

Antipneumococcic Serum (Felton) Type I, Refined and Concentrated, is available in syringe packages containing 10,000 and 20,000 units; Antipneumococcic Serum (Felton) Types I and II, Refined and Concentrated, in syringe packages containing, respectively, 10,000 and 20,000 units of each type.

IF you have put off buying diagnostic x-ray apparatus until you could satisfy yourself that, for what you can afford to pay, you will get what you'd really like to have—then it's time to size up the G-E Model R-36.

You want high quality, of course—reliable equipment to produce results that will reflect credit to your professional service. The R-36, designed for a much wider diagnostic range than the usual office x-ray unit, equips you ideally for radiographic and fluoroscopic examinations – including fractional-second films of the chest at six feet.

Self-contained and extremely compact, the R-36 is readily accommodated in a small floor space. Completely oil-immersed, it is shockproof, dust-proof, and moisture-proof—free from the effects of atmospheric variations. These outstanding features, combined with an ingenious control system which simplifies operation and gives you accurate and refined control of the x-ray energy, are reasons why you can rely on the R-36 for a uniformly high quality of results.

You'll have an entirely new conception of office x-ray equipment when you get all the facts on the R-36, and learn, too, that the moderate price and easy terms of payment bring it conveniently within your means.

L. J. FLYNN, 544 Market Street, San Francisco (DOuglas 0577)

Copyright, 1938, by the California Medical Association.

Subscription prices, $5 ($6 for foreign countries); single copies, 50 cents.

Volumes begin with the first of January and the first of July. Subscriptions may commence at any time.

Change of Address.—Request for change of address should give both the old and the new address. No change in any address on the mailing list will be made until such change is requested by county secretaries or by the member concerned.

Responsibility for Statements and Conclusions in Original Articles.—Authors are responsible for all statements, conclusions and methods of presenting their subjects. These may or may not be in harmony with the views of the editorial staff. It is aimed to permit authors to have as wide latitude as the general policy of the Journal and the demands on its space may permit. The right to reduce or reject any article is always reserved.

Contributions—Exclusive Publication.—Articles are accepted for publication on condition that they are contributed solely to this Journal. New copy must be sent to the editorial office not later than the fifteenth day of the month preceding the date of publication.

Contributions—Length of Articles: Extra Costs.—Original articles should not exceed three and one-half pages in length. Authors who wish articles of greater length printed must pay extra costs involved. Illustrations in excess of amount allowed by the Council are also extra.

Leaflet Regarding Rules of Publication.—CALIFORNIA AND WESTERN MEDICINE has prepared a leaflet explaining its rules regarding publication. This leaflet gives suggestions on the preparation of manuscripts and of illustrations. It is suggested that contributors to this Journal write to its office requesting a copy of this leaflet.

CALIFORNIA COUNTY HOSPITAL BUREAUCRACY! WHICH WAY LEADING?—STATE MEDICINE, THROUGH A BACK-DOOR ENTRANCE?

Kern County Hospital Controversy Revived. Several years ago, in connection with the administration of Kern County's hospital, some important issues arose, when a group of citizens contended that the Board of Supervisors was using county funds to provide hospital care, not only for the indigent sick, but also, and illegally, for persons themselves well able to pay for hospitalization in private institutions, or having relatives legally liable for their support. The case came to trial in the Superior Court of Kern County, where Judge K. Van Zante handed down, on December 4, 1933, his opinion. An appeal from Judge Van Zante's decision was taken by a group of taxpayers of that county (Civil case No. 1761), and on January 30, 1936, the Fourth Appellate District Court of California rendered its ruling on the prior decision of the lower Superior Court.

For careful perusal by members of the California Medical Association, this opinion of the Appellate Court, as given by Justices Marks, Barnard and Jennings, is printed in full, under the caption Exhibit D, on page 106, in this issue; because that decision, since it was handed down two years ago, has been set forth in several California counties as an excuse and a right, presumably legal, to inaugurate what are little less than radical departures from former procedures having to do with the admission of patients into county hospitals, these innovations amounting practically to a form of state medicine, or perhaps something worse.

* * *

The Los Angeles County Hospital as a Major Offender.—Our comments, in this issue of the OFFICIAL JOURNAL, on what is taking place in some of our county hospitals, will be largely confined to some startling and little less than outrageous procedures which have been inaugurated in the Los Angeles County General Hospital during the last six months, or since about July 1, 1937, the beginning of the present county fiscal year.

† Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

The Los Angeles County General Hospital: Its Organization.—First, a few words about the Los Angeles County General Hospital, a public institution which the County of Los Angeles, as a constituent unit of the State of California, in accordance with provisions in the constitution of the State designed to conserve the health and lives of indigent citizens, maintains under supervision of a board of five supervisors elected from the five geographical supervisorial districts.

The Los Angeles County *General* Hospital, under the general jurisdiction of the County's Department of Charities, has two divisions: the "Los Angeles County Hospital," a unit with an attending staff of 508 physicians and surgeons licensed under the Medical Practice Act of California, and the "Los Angeles County Osteopathic Hospital," staffed by licentiates of the California Board of Osteopathic Examiners. The two divisions are quite independent, one from the other, but what is stated below concerning bills rendered to patients applies not only equally to the two divisions, but also to the large county tuberculosis hospital known as Olive View Sanatorium, an institution having about 1,000 in-patients; the county also providing hospitalization for about 1,000 additional patients housed in some twenty tuberculosis rest homes, and likewise giving tuberculosis relief for an additional 2,000 patients who are hospitalized in their own homes.

What the capital investment of the Los Angeles County General Hospital, located on Mission Road and State Street, as represented by its acreage and buildings, amounts to, we do not know, but it may be of interest to note that the new acute unit of the Los Angeles County Hospital, opened several years ago, was erected and equipped at a cost of some seventeen millions of dollars. These figures may have a bearing on some of the new hospitalization charges made by the Department of Charities and County Hospital authorities, brought into being, it has been stated, because of interpretations of the Appellate Court opinion in the Kern County Hospital case.*

* * *

Los Angeles County Hospital Admits More Than 50,000 Patients Yearly.—In the Los Angeles County Hospital (medical division of the Los Angeles County General Hospital), during the fiscal year July 1, 1935-July 1, 1936, a total of 57,100 patients were enrolled as in-patients; and during the next fiscal year, 1936-1937, a total of 56,774 in-patients received care. The average number of patient days was 14.6 in 1935-1936, and 14.7 in 1936-1937.

At this moment, we do not have at hand the total number of hospitalized patients admitted there in previous years, nor are the figures available for patients registered in the tuberculosis division (Olive View and adjuncts), or those on the infirmary rolls of Rancho Los Amigos (the County Farm). For our purpose, in order to point out the deplorable system recently instituted, the massive total of 56,774 in-patients for the last fiscal year will suffice, since an approximately similar registration may be expected to obtain for the current fiscal year.

* * *

What Is Wrong in the New Admission System of the Los Angeles County Hospital?—Now, what are the particular procedures to which objection and complaint are made, and why?

1. Since July 1, 1937, every patient (whether socially serviced and registered, and acknowledged as a 100 per cent "indigent," or a "medically indigent person" (part indigent?), or a "non-indigent" in law (this last citizen, presumably a person who himself, or, through legally-liable relatives, possesses means sufficient for his support, in health and in illness), has been receiving a statement from the County of Los Angeles—sent out through its Bureau of Accounts and Collections of the County Department of Charities—for hospitalization costs, to cover periods of care in the Los Angeles County Hospital. In addition to such bill-bombarding, efforts are made, we have been told, to induce every patient so admitted to sign over in favor of the said County of Los Angeles liens on insurance policies or equities in real estate or other possessions, real or personal, at present held by the patients, or in the future to be acquired, and thus permit the county, presumably sometime in the future, to attempt collection in case such payment for hospitalization charges is not immediately forthcoming!

2. But even that is not all. The hospitalization charges, so made (only a few of which instances have been called to our personal attention, so that, to date, we believe no attempt has been made to contact the hundreds of former patients who have received statements for hospitalization care since July 1, 1937), in some instances must be classed as little less than stupid and outrageous! Stupid, because it is almost impossible to understand how hospital administrators of any experience, and especially those who should be familiar with the almost constant and equal assessments of the private hospitals of Los Angeles, could have been guilty of aiding in the computation of fee schedules such as have been promulgated; and outrageous, because to even well-to-do citizens in private hospitals some of these charges would be

* Editorial articles on the Los Angeles County Hospital which have appeared in previous issues of CALIFORNIA AND WESTERN MEDICINE, include the following:

Does Los Angeles County Hospital Extension Into Private Hospitals Constitute a Menace to Medical Practice? (Editorial) Volume 32, No. 2, February, 1930, page 117.

County Hospitals Should Print Annual Reports. (Editorial) Volume 42, No. 1, January, 1935, page 40.

appalling! When such charges and demands are rendered to indigent or near-indigent citizens, afflicted not only with poverty, but, shall we say, often also with ignorance or lack of education, and, so, incompetent to understand the implied demands for money, in letters filled with legal phraseology, it is not to be wondered at if fear and worry are produced among those very unfortunates who should be free from such assault.

* * *

Detailed Information Appears on Page 97.—On other pages in this issue will be found some exhibits that shed light on what has been here stated, and members of the California Medical Association are advised to inform themselves of what is going on before their very eyes, as well as to ask if that which is being done is not a form of state medicine or worse, instituted, perhaps, without proper warrant of law? Also, whether, if continued, it must not lead to dire effects, not only upon medical practice, but upon the moral and ethical standards of the very county where such a policy of caring for California's sick indigents was inaugurated?

* * *

One Example of the Atrocious Charges for Hospitalization Care.—Space does not permit extended comment here, but one example can be cited briefly to show the preposterous and unjust nature of these charges made by the County of Los Angeles to its indigent sick; a fuller itemized statement being given on page 105, under Exhibit C.

A cesarean section having been necessary for this particular patient, charge for the use of the Los Angeles County Hospital operating room and its nursing personnel alone (the attending staff obstetricians donate their services to the county, as an expression of altruistic service to the indigent sick) was as follows:

Date	*Description*	*Charges*
October 5, 1937	Operative—Cesarean Section	$136.80
October 9, 1937	Operative—Blood Transfusion (450 cc.)	22.50

The total bill for that particular patient and new-born child for twelve days' hospitalization (that is, for food, board and nursing, because the county has no legal right to charge for professional services rendered gratuitously by the attending physicians and surgeons) was $215.41!

It may be of interest to state that the attending obstetrician for the above patient, about the same time, had a patient in the Cedars of Lebanon Hospital of Los Angeles, for whom also a cesarean section was necessary; where the operating room-personnel charge was $12.50! Contrast now this latter operating room charge (which would be about the same in every other accredited private hospital in Los Angeles) with the charge of $136.80 by the Los Angeles County Hospital, and let each physician ask himself what kind of language comes to his mind, as he would express his opinion thereon?

Attending Staff of the Hospital, Whose Members Give Gratuitous Service, Should Ask Themselves Some Questions.—As has been said, the Los Angeles County Hospital has an attending staff of 508 physicians, surgeons and specialists, practically all members of the Los Angeles County Medical Association, who give their professional services gratuitously in care of the indigent sick. Each of these attending medical men may well ask himself a number of very pertinent questions in connection with what has been stated above and elsewhere in this issue of the Official Journal. And especially so, since the annual money value of their professional services in caring for some 56,774 patients (medical and surgical care, and operations) has been estimated to be in excess of two million dollars! By contrast, the entire city of Los Angeles, a community of more than one million persons, swells with pride, and for days covers itself with glory in the newspapers, in attaining from these one million fellow citizens the sum of $2,865,654, as a Community Chest goal!

* * *

What Will Become of These Liens on Possessions of Indigents and Near-Indigents?—Naturally, with things such as the above happening, protests are being made by former patients. The retiring president of the Los Angeles County Medical Association cited the case of one former patient who was so pestered by the Los Angeles County Bureau of Accounts and representatives, seeking to make her sign over a lien for county hospital hospitalization services rendered, that she consulted an attorney, who told her to sign nothing. Unfortunately, this advice cannot be communicated to the hundreds of other indigents, in real danger of such experiences.

What is to become of all these liens gathered on the basis of Los Angeles County Hospital hospitalization? Will they later be auctioned off to tax sharks, like delinquent tax bills? And if not, why keep them and hold them over the heads of poor citizens, and so cloud title in any property they may be able to free from indebtedness? Protests have already been presented to the Public Health Committee of the Los Angeles Chamber of Commerce, and the rumbling has become sufficiently intense, at the end of six months, that the superintendent of the County Hospital has seen fit to write to the County Auditor on the subject. His letters are presented in the exhibits. They may be read, in connection with others.

* * *

A Thorough Investigation Is Indicated.—Grand Jury investigations on ways and means of conserving county resources, as well as the rights of citizens, are certainly nothing new in Los Angeles, and a thorough investigation is indicated on the basis of the evidence already in hand, and much more of which would probably be easily forthcoming, if sought. Such an investigation by an impartial grand jury committee would bring out the facts, and no doubt lead to a removal of all obnoxious elements involved.

It is our opinion that the members of the Board of Supervisors have only a casual knowledge of what is taking place in these matters here discussed, because that group of five men are responsible for a county with income and expenditures almost as large as those of the U. S. Steel Corporation, and they must necessarily depend upon their subordinates for proper administration. Somewhere, then, in all this, it is possible that there exists a case of "Bureaucracy Going Wild."

Because of the menace to the interests of the indigent sick, to the public, and to the medical profession, the offenses complained of should at once be stopped. And last, but not least, the county hospitals of California should be administered with due regard to the laws of the State, which in all this seem to be flagrantly disregarded. So much, on this vexed subject, for the present.

PLEA FOR THE PRESERVATION AND COMPILATION OF MEDICAL ARCHIVES OF COUNTY MEDICAL SOCIETIES

Lure of Medical History: William Watt Kerr, Joseph P. Widney, Philip Mills Jones.—Were you among those who read Dr. Herbert C. Moffitt's delightful sketch of one of the former guiding spirits in California medicine—the late William Watt Kerr of San Francisco? If not, you do yourself an injustice if you do not take the time and peruse it, and so enjoy the portrayal of the life of a physician whose professional work went far, in his time, in maintaining high standards of practice in our State. In addition, you will find that the article contains other interesting medical information of days gone by, which Doctor Moffitt outlines in charming style. Our medical forbears, even of so recent a period as scarcely half a century ago, loved their profession and guild with an intensity worthy of emulation by present-day disciples. Their controversies and battles, of interest even yet, were not the least of the many absorbing stories that might well find proper place in a chronicle of their periods. Doctor Moffitt's paper appeared on page 27 of the January issue.

* * *

On page 4 of the same number reference was made to Dr. Joseph Pomeroy Widney, motivating leader in the group of physicians who, on January 31, 1871, founded the Los Angeles County Medical Association, at a time when that present-day metropolis was little more than a small Mexican town. Today's members of that county society, one of the largest component county societies in the United States, may well be proud of their history, and also of their founder, who celebrated his ninety-sixth birthday on December 26, 1937, and, in spite of the heavy handicap of blindness, continues his work both as a student and scholarly author. It will probably never come to pass again, for anyone to record in the medical annals of California, that it fell to the lot of one of its physicians not only to have witnessed the great changes which have been created in the last seventy-five years in the Golden State, but also, at the same time, to have been intimately associated with, and to have had far-reaching influence in a host of civic, educational and medical endeavors that came to the front, as one decade succeeded another. Founder Widney's life has been so rich and full of service that every member of the California Medical Association may take pardonable pride in his career.

* * *

In the January issue, also, appeared a brief survey of the founder-editor of the OFFICIAL JOURNAL of the California Medical Association—the late Philip Mills Jones.* What a magnificent work he also accomplished, in his comparatively short life! Keep in mind that, in a few brief years, with a state medical journal in its swaddling clothes, and on a precarious financial foundation, his pen gave expression to views on medical journalism and ethics which the medical press of the United States, in decency and self-respect, found it could do nothing else than to adopt, thereby removing from the pages of their magazines a mass of proprietary and other advertising of unscientific products, even though at a loss of thousands of dollars to their incomes. But to Editor Jones, militant and courageous, in the righteous battle, all who transgressed were alike a foe. For that splendid service, both national and state medical societies may well be grateful to California.

* * *

Every County Medical Society Should Appoint a Committee on History, to Take Up This Work.—It is true, that only a few physicians can attain the heights reached by the men above mentioned, but the spirit of pioneers and leaders, such as the late Doctors Kerr and Jones, and our still living Doctor Widney, can be and is made part of the life of every physician who meets his professional and civic responsibilities in manner as earnest and fine as that with which these pioneers took up the consideration of each day's problems. As a matter of fact, there is not a county in this great state in which, if search were properly made, there could not be found the records of medical men who, in like fashion, have gone forth to each day's labors with outlook, both broad and gentle, dedicated to devoted service for their fellow men and patients, and to the communities in which they practiced their profession.

It is to this group of physicians, practically unknown in the sparse medical records of days gone by, as possessed by the California Medical Association, that we would direct the attention of component county societies. Before it is too late, and wherever a component county medical society exists, each such organization should appoint a Committee on History, to gather together the old record books, to secure biographical and other information, not only of former members, but of public health and similar activities in their respective communities. For better preservation, the old record books might well be sent to the central office of the California Medical Association for safe-keeping. Biographical and other sketches

* See pages 1 and 60 of the January issue.

may be forwarded to California and Western Medicine, for future appearance in its pages, or placement in the archives of the California Medical Association, for use when the needed history of our Association is compiled.

California and Western Medicine, therefore, expresses the hope that in every county society there will be one or more members sufficiently interested in the collection of historical memorabilia to lead them to present a resolution at an early meeting that would bring into being the appointment of a Committee on History, to take up this interesting and much needed work.

A. M. A. SESSION IN SAN FRANCISCO, JUNE 13–17; C. M. A. SESSION IN PASADENA, MAY 9–12, 1938

American Medical Association Session, June 13-17.—Once again, the California Medical Association will play host when, on Monday, June 13, the American Medical Association will open another five days' session, constituting its eighty-eighth annual convocation. On page 127 of this issue, in the Association news department, is given the list of local committees appointed by Dr. Howard Morrow, president of the California Medical Association and chairman, as delegated, of the Local Committee of Arrangements.

The city of San Francisco, in its handsome civic center buildings, possesses exceptionally good facilities for general and scientific section meetings, and for commercial exhibits. This year's program of papers is yet to be published in the *Journal of the American Medical Association*, but it may be taken for granted that they will measure up to the highest standards of previous years.

It is unfortunate (to make a contrast) that Los Angeles, through lack of adequate accommodations, is handicapped in so far as conventions of organizations such as the American Medical Association are concerned; for, as a matter of fact, the auditorium and other meeting place facilities of that large city are today really less serviceable and satisfactory than they were in 1911, when the American Medical Association held a session for the first and only time in Los Angeles.

It is to be hoped, therefore, that members of the California Medical Association will make note of the dates for the meeting of the American Medical Association in San Francisco, these being printed on the front cover of each issue of the Official Journal, and that a large number of physicians will avail themselves of this rare opportunity to attend, breathe the spirit of an annual session of the great national organization, and by their presence at the scientific and other gatherings partake of the stimulating, intellectual profit that is surely one of the rewards of attendance. A word, also, in regard to hotel accommodations: Members who are looking forward to attend *should request their reservations now.*

* * *

California Medical Association Session, May 9-12.—This year's annual session of the California Medical Association preceding that of the American Medical Association by about one month, will be held at the Hotel Huntington, Pasadena, commencing on Monday, May 9, and continuing for four days. The formal program will be given in a supplement to the April issue of California and Western Medicine, and, in due time, complete information concerning the scientific and other programs will appear in the Official Journal. This famous hostelry has been the scene of former sessions, most pleasantly remembered, because of conveniences made possible by the size of that hotel, and there, also, a large attendance is awaited. Requests for room reservations may be sent to the Hotel Huntington, and should be made without delay.

CALIFORNIA ATTORNEY-GENERAL'S RULING ON PUBLICATION OF CALIFORNIA MEDICAL-ECONOMIC SURVEY REPORT

For the information of members of the California Medical Association to whom the matter may be of interest, the following item from the Oakland *Tribune* of January 13, 1938, is given space:

State Medical Survey Open to All, Says Webb

Private Individuals May Print and Circulate Data, Attorney-General Holds

"Private individuals may print and circulate complete details of the $100,000 California medical-economic survey. . . .

"The way for this action was paved today by Attorney-General U. S. Webb in an informal opinion given in reply to a query from Assemblyman John Gee Clark of Los Angeles. . . .

"Webb said that there appeared to be 'no objection to printing any of the matters contained in the report, provided no incorrect statements were made in connection with the publication.'

"The accuracy proviso, he declared, would require any private publisher to designate those sections disapproved by the State Board of Health, to which the final report was submitted.

"Despite outside contributions, Webb ruled, the complete report remains the property of the State, and discretion as to what shall be contained in the official report published by the Board of Health remains with the Board of Health.

"This contention was borne out, Webb said, by a communication from Corrington Gill, Assistant WPA advisor at Washington, D. C., to James B. Sharp, coördinator of statistical projects for the WPA, in which it was pointed out that any individual might avail himself of the data."

* * *

To the informal opinion of Attorney-General Webb of California, noted above, may be added the following clarifying statement from the Federal authorities:

(COPY)

OCSP-1-11
San Francisco,
January 3, 1938.

Professor Paul A. Dodd,
Department of Economics,
University of California at
Los Angeles, California.

Re: Publication of Medical-Economic Report

Dear Doctor Dodd:

In reply to your request of December 9 relative to publication of the Medical-Economic Report, we are pleased to

inform you that under date of December 28, Assistant Administrator Corrington Gill writes as follows:

"Inasmuch as the basic data on this study are now available, there need be no question raised concerning a further analysis or interpretation of these data. It is the privilege of any individual to avail himself of published data and interpret them as his philosophy dictates, and Professor Dodd's request differs from this in no respect. . . . No clearance with the Works Progress Administration was necessary."

*This reply, we believe, will officially close the correspondence on this FERA [Federal Emergency Relief Act] undertaking in so far as the WPA [Federal Works Progress Administration] is concerned.**

Very truly yours,

WILLIAM R. LAWSON,
Administrator.

By JAMES B. SHARP,
Coördinator of Statistical Projects.

EDITORIAL COMMENT†

A NEW EUROPE**

Ex Oriente Lux
Ex Occidente Dux

Some years ago, a British statesman, in a speech at Johns Hopkins University, said: "Europe is dying. You can do nothing to save her. Keep clear." Was he right, or was it a mistaken prognosis? Maybe it was only an error of the sickroom. Maybe it was not death, but only a need of a change in the treatment of the case: rather would it seem that it is the civilization that is sick, and not necessarily the race. One thing is certain: Thus far, it has not proved to be a sickness unto death. Although the civilization of Europe is unquestionably threatened with dissolution, its peoples are not. They are full of vitality. It is a case where the peoples have outgrown their civilization. It is like the boy who becomes a man and has outgrown his boyish attire. To attempt to wear the old means tearing and ripping. The full grown Europe of today has simply outgrown the badly worn, youthful clothing of ten centuries ago.

Was that old civilization of ten centuries ago a mistake? Not necessarily so. The boy in man's attire would have been tripping himself in the larger garments of a man. The civilization which grew up after the overthrow of the older Latin type was suited to the age. It was the civilization of emperors and kings, of popes and priests; of the crude mechanical appliances; and of sparsely settled lands with food yet in abundance. It was an era of wars that never seemed to cease. Ambitious men fought for power and rule. It was preeminently the age of the strong man, and the stronghold; an age when the successive rulers were those of birth and not of brains.

All this has changed. Iron and coal have transformed Europe. It is now an overpopulated land of factories and shops and densely crowded cities. There are more people than the land can support. The one great cry of Europe now is for bread. And its rulers are no longer holding their office because of the glamor of birth and caste, but are taking the place of the degenerate royalty by right of brains and not birth. The caste of nobility is disappearing. The nobleman, now, is not the man with an inherited castle, with drawbridge and moat; but the man who does things, who brings things to pass. The old is passing. It is the time of rebuilding.

But the old does not give up peaceably; and would-be strong men, fired by ambition, foment strife. And there are not many men who, like Aristides and Edward VIII, go quietly into exile. The lust for power is strong. The ability to use it is too often weak.

What can be done to make the transition from the old to the new one of peace, and a peace that shall abide? Much of what follows I have already told in the chapter on "World Problems," in my work, "The Rebuilding of a Wrecked World Civilization.‡ I recount it for a purpose: to aid in the rebuilding of the wrecked civilization of Europe.

These changes must be, if the future is to hold a better fate for Europe than the past:

First: There must be a realignment of Europe upon racial rather than upon national lines. Let there be no more dynamite storehouses like Austria, with its seventeen different peoples and tongues. Let *like* seek and ally itself with *like,* racially: Engle Man of the North Seas with Engle Man; Teuton with Teuton; Latin with Latin. And the unstable Celt—like the Galatians over whom Paul lamented—mingling and losing himself in all, but furnishing the music, the artistic inspiration, the well springs of literature, to all, as his contribution in the building up of a new world humanity.

Second: There must be a line of absolute division between religion and the civil life of humanity. The monastery and the Pontiff Maximus of Rome did their work, and did it well, in the upbuilding of the Mediaeval civilization of Europe; but in the upbuilding of a new civilization they are as much out of place as the mammoth or the cave bear or

* Editor's Note.—Italics our own.

† This department of CALIFORNIA AND WESTERN MEDICINE presents editorial comments by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California Medical Association to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

** The author of this essay is Joseph P. Widney, M.D., D.D., LL.D., founder of the Los Angeles County Medical Association, who attained his ninety-sixth birthday on December 26, 1937. (See January CALIFORNIA AND WESTERN MEDICINE, page 4.) Biographical data concerning Doctor Widney were printed in CALIFORNIA AND WESTERN MEDICINE, April and May, 1936, on pages 292 and 396.

‡ For review of this book, see CALIFORNIA AND WESTERN MEDICINE, December 1937, on page 367.

saber-toothed tiger. *Requiescat in pace mortuorum.* The new civilization must have no religious wars. Civically, it must be neither for nor against religion. Each man, whether "infidel" or believer, must be free to settle with God for himself.

Third: No closed seas and no hostile fleets must ever separate the races from the field of their food supply. The future food supply for Europe is to come from Africa. The unused and arid lands of that continent must be equitably divided for reclamation and cultivation; and no Gibraltar-Suez line must ever intervene. The Mediterranean, in peace or in war, must cease to exist as a barrier between kitchen and storehouse. And no transverse line from Sicily to Tunis must divide East from West. The Mediterranean must be made a free highway for all races.

I have written, in the work to which reference has been made, of other problems which a rebuilt world civilization must face. These that I have now written are the problems of a rebuilt Europe. And Europe must face them or die.

3901 Marmion Way.
August 20, 1937.

Joseph P. Widney,
Los Angeles.

HOSPITAL RADIOLOGISTS AND PATHOLOGISTS

The California Medical Association has now come out in favor of having doctors who practice radiology and pathology rent space (and equipment) of hospitals instead of having the hospital hire the doctors.[1] Two very enlightened men—one a radiologist, the other a hospital administrator—laid the groundwork of principle for this plan, and other enlightened men are adhering to these principles.

We are aiming to better the care of sick people. It is necessary that doctors do well enough financially so that able minds may be attracted to medicine as a career. It is necessary that hospitals make a financial success or decent hospital care will cease to be available. What magic is there in a particular type of financial arrangement between a hospital and a doctor (radiologist, pathologist) that will better the lot of both of them?

The matter would seem to rest at bottom on the professional side. The opportunity to cultivate his career for his own professional and financial advancement ought to attract as able men to hospital quarters as to downtown offices. There would be a displacement of a couple of types of laboratory specialists that one still sees often in hospitals, namely, the one not able or not experienced enough to stand on his own feet, and the one whom economic necessity forces to give first attention to his downtown office, leaving the hospital in the second place.

An able man building his own career in hospital quarters will pick up the responsibilities that go with this freedom. He will be always in the one place—his hospital office, which will encourage the staff doctors to ask him personally about findings and proposed examinations. His work will be tied to his name, his services will be of a doctor to other doctors and their patients. Criticisms of his work will come direct to him and not to the hospital management. Doctors will tell the radiologist to send for a patient and examine her chest, instead of telling the floor nurse to "get a chest x-ray." This gives him a chance to find out what is being searched for and an opportunity to mobilize the resources of his specialty. If he can make his examinations more helpful, he will be more often called upon. If he has unique abilities, patients will be sent even from downtown to make use of them.

The hospital staff, seeing more intimately the work of pathologist and radiologist, might voice their conviction as to whether Dr. A or Dr. B is good enough to be allowed to rent space in their hospital.

The radiologist renting space will be courageous in investing in new equipment, even more than where it devolves on the hospital, for he will have not only the need to keep his department technically efficient, but also to advance himself professionally.

It is not that the pathologist and the radiologist will do perfectly when "on their own." They will make all the usual mistakes of doctors. Availing themselves of permission to collect their own bills, they will likely pile up uncollectible accounts in a way no hospital business manager would tolerate. Yet even this shortcoming, being a mark of freedom, ought to be cherished. It is still permitted, we believe, to hold for the private practice of medicine.

As pathologists and radiologists do take on this recommended rental arrangement with their hospitals, and so gain opportunity to build themselves *in a hospital* a real medical career, they will have to conduct themselves like doctors, not technicians. They will have to get their shoulders under the responsibilities of caring for sick people. They will have to look as closely at their patients as at their shadows and effluvia. They have the opportunity of teaching the well-to-do to pay well and like it—and the duty of caring for the dead-beat for nothing, and liking that (or pretending to with as good grace as may be).

Theirs will be a difficult career. They will have to satisfy their patients, who do not know what is good medicine and what is bad; and also to convince their referring physicians, who do know or ought to.

Anyhow, here is opportunity—the possibility to develop in hospitals radiologists and pathologists who are not just doers of medical chores, but who can cultivate careers in which they can really take pride.

And when they have made a success they will be able to afford to pay their hospital a rental not inferior to what the hospital nets from its rooms. Moreover, the presence in the hospital of these successful specialists will prove attractive to the staff, whose patients make the hospital's prosperity.

The report refers also to university hospitals. The obligations and opportunities of teaching and

1 California and Western Medicine, 46:419, June, 1937.

of leadership only accentuate the considerations already commented on. A pathologist or radiologist who accepts a straight salary, turning the fees from his practice into the school funds, may feel well repaid by the opportunities for research and some relief from the necessity to cultivate a private practice in order to make a living. But what a medical school does must have an influence on what the medical profession will take as acceptable. Schools ought, one would say, to lead as well as to point the way to what is best in the practice of medicine in general.

Stanford University Hospital.

NEONATAL MORTALITY IN SAN FRANCISCO*

For the past decade the infant mortality rate in San Francisco has steadily declined. In 1934, the rate dropped to an all-time low of thirty-three per one thousand live births from thirty-nine in 1933, at which point it had been stationary for two years. A slight rise to thirty-five was seen in 1935, and a marked increase to forty-two occurred in 1936, the circumstance surrounding which rise having previously been described.[1]

NEONATAL PERIOD USED IN THIS STUDY

In San Francisco, as in other cities, the majority of the infant deaths occur in the neonatal period, which for the purposes of this study was considered under fifteen days. Other factors which vary from year to year influence the total rate, but over a period of ten years the neonatal death rate has been practically stationary. It was with this fact in mind that the present study was undertaken in order to determine, if possible, what factors were present in maintaining the rate level. Could this rate be reduced or had we reached that theoretical point called the irreducible minimum?

SAN FRANCISCO HOSPITAL FIGURES

It may be of direct interest to point out that the Department of Public Health, through the San Francisco Hospital and its out-patient obstetrical department, delivered in 1933, altogether, 18.2 per cent of the total births that occurred in San Francisco. In 1934, the same agencies delivered 15.5 per cent; in 1935, 14.2 per cent; and in 1936, 11.2 per cent. This reduction is quite remarkable, and is perhaps the most sensitive index to the return of a better economic era.

It could be further pointed out that the ratio of births delivered by these services of the Department of Public Health and the low mortality rate of thirty-three in 1934 may be of some significance. Likewise, the rising infant mortality rate which has occurred in the city and county of San Francisco since 1933 and the decrease in the number of births delivered by the services of the Department of Public Health may be equally significant. It is desired to state, however, that no criticism is intended of the private physician, nor any credit assumed for the excellent record of the departmental services, because it is realized that the pregnant woman, in selecting a physician, quite often materially delays the decision and, in our experience, the private physician does not see the case as early as the out-patient clinic of the Department of Public Health.

For the past six years the out-patient obstetrical service of the Department of Public Health has performed the Wassermann test on all pregnant women coming under its supervision. It may be of additional interest to show that the percentage of positive Wassermann tests has averaged approximately 4 per cent.

NEONATAL DEATHS STUDIED

A total of 231 neonatal deaths occurring between January 1, 1936 and April 30, 1937, were studied. These represent a typical section out of any period in the last decade with reference to the relative

incidence of the several classifications. Of the 231 deaths, 132 were males and 99 females. Diagnosis was confirmed by necropsy in 101 instances, or 44 per cent of the total.

CAUSES OF DEATH

The greatest cause of death among the neonatal group is prematurity (Table 1), which was responsible for 137 in this group, of which seventy-seven were males and sixty females, and of which fifty-four, or 39 per cent, came to necropsy. Prematurity as a cause of death is given preference when reported jointly with certain other causes, and Table 1 indicates the joint causes appearing in the group studied. In twenty-five cases that came to necropsy the cause of death is prematurity alone. In twenty-nine other necropsies in the premature group, additional causes were found. The postmortem findings in this group of fifty-four, of course, would have to be reviewed with considerable detail in order to determine what caused the deaths to be diagnosed as premature.

Pathologists themselves are quite willing to admit a certain percentage of unsatisfactory results in this group. Much too frequently they are compelled to rely on the history and the measurements for the diagnosis of prematurity, for the simple reason that prematurity *per se* does not leave any recognizable changes at necropsy; and prematurity is given as the sole cause of death, because no sign of tissue change which would cause death is found. The theory advanced by some that these deaths are physiochemical in character offers a field for investigation which as yet is relatively untouched.

The second important group of neonatal deaths, according to the International Code, is congenital malformations. A total of twenty-seven makes up this group (Table 2), with fourteen males and thirteen females, of which number fifteen, or 55 per cent, came to necropsy. These causes are self-explanatory and require no comment, as, naturally, they originate *in utero*. The relatively high percentage of necropsies in this group is significant,

* Classified outside of diseases peculiar to early infancy (161).

suggesting the possibility that in the presence of a recognizable abnormality the curiosity of the attending physician is aroused and extra pressure is exerted to secure a necropsy.

The third group classified is one which may lead to considerable misunderstanding. The heading in the International Code (160 B), "Injuries at Birth," lists as a subheading, cerebral hemorrhage directly as a result of injury; also, in the same division, cerebral hemorrhage from any cause whatsoever without reference to injury. Many instances of cerebral hemorrhage are entirely unrelated to trauma as an etiologic factor, and the classification of such deaths under the general heading, "Injuries at Birth," is misleading. In the group studied (Table 3), there were twenty-five deaths, of which sixteen were males and nine females, with twelve necropsies, or 48 per cent. The need for very careful reporting of these deaths, and especially the need for a greater percentage of postmortem studies in this group, is apparent if the present situation is to be clarified.

The fourth group (Table 4) does not follow the International Code classification because there is only one death (occasionally two or three) listed under each cause. Some of these causes come under the heading, "Other Diseases Peculiar to Early Infancy," and others marked (*) have a classification of their own; but, with twenty causes of death among forty-two deaths, the number in any group is too small to be of significance. Attention is called, however, to the evident fact that those diagnoses without necropsy mean very little from either a statistical or pathological point of view. As in Group 3, there were 48 per cent that came to necropsy.

SUMMARY

1. Neonatal deaths among male infants are more numerous than among female infants in the ratio of approximately 132 to 100. Compared with the birth ratio of 106 to 100, this is an actual as well as a relative high death rate among male infants.

2. A definite need exists for the further investigation by physiochemical studies of the premature infant, both antemortem and postmortem.

3. Except in the premature group, diagnoses without necropsy are always open to question and, if reliable information is to be secured, a greater number of carefully recorded necropsies must be performed.

4. Careful reporting to the local registrar and health officer of the cause of every neonatal death should be the first duty of the physician.

THE CRIMINAL INSANE*

By Ruggles A. Cushman, M.D.
Talmage

Discussion *by Edward W. Twitchell, M. D., San Francisco; A. M. Kidd, Professor of Criminal Law, Berkeley; Milton B. Lennon, M. D., San Francisco.*

THE term, "criminal insane," is commonly applied to public offenders who are suffering from psychoses or from mental deficiency. There are about four hundred of this class in our California state institutions, about three hundred of whom are confined in the Mendocino State Hospital, which has been semi-officially designated the hospital for the criminal insane; one hundred, of various degrees of mental disturbance, in the State penitentiaries; and the remainder, most of whom have committed minor offenses only, scattered throughout the remaining state institutions. How many are still at large we cannot tell, nor how many border-line cases there are in the penal institutions and jails.

"CRIMINAL INSANE": ITS MEANING

To the psychiatrist and the jurist, through whose hands these four hundred or more have passed, the term "criminal insane" means something different from this general conception, or, perhaps we should say, means nothing, and is just a loose and convenient combination of words. From the psychiatric point of view these people do not differ from any other group of mental patients of like number. Some come to the State Hospital from Tehachapi, Folsom, and San Quentin, having been diagnosed there as mental cases, after conviction; some come from the various counties before trial, because they have been found legally insane and so not subject to trial until recovery. But the majority of them come after trial, when they have been adjudged not guilty by reason of insanity. To the psychiatrists at the hospital they are like other patients, except that they arrived under a different kind of commitment, and they are treated like the others, except for the extra caution used to prevent their escape.

From the legal point of view, the term "criminal insane" is wholly inconsistent, and has even less significance. As a legal principle, one cannot be insane and a criminal at the same time. An idiot and an insane person cannot commit a crime, the law declares, but adds in effect, "The law is going to define what an idiot or an insane person is, however, and not the psychiatrists."

BETTER CLASSIFICATION NEEDED

The "criminal insane" classification is loose and inadequate, both from the psychiatric and legal point of view, and should be replaced by a more scientific phrase, just as the term "insanity" has been discarded in psychiatry because it is no longer adequate to include all the facts and theories which have developed in that field. For the purpose of this paper, we will now use the expression as embracing all that class of psychotics and mental deficients who reach our public institutions through criminal-court proceedings.

It is in these proceedings that the conflict between medical and legal conceptions of mental disease is displayed so noticeably. The disadvantage is all on the part of the psychiatrist, because he must conform to the law, not the law to the psychiatrist, and because the law is out of step with modern psychiatry.

We can see how complete this disadvantage is when we consider that even though the prisoner whom the psychiatrist has been requested to examine is found to be definitely psychotic, and though opposing counsel, the judge, even the jury, accepts his diagnosis as correct, still, according to law, the defendant may be found sane, perhaps sentenced to hang. On the other hand, a defendant may be found not guilty by reason of insanity when all the alienists on both sides have testified he has no psychosis.

PSYCHIATRIST IN COURT PROCEEDINGS

At the various stages in a criminal proceeding, the psychiatrist, who is examining the prisoners, discovers that none of them is there for the primary purpose of making a diagnosis, but rather he must ever be vigilant in preparing himself to answer questions of fact upon which he will be cross-examined in court, and which are concerned not with psychiatry, but with lay tests formulated by courts and jurists centuries ago. Further, he must be prepared to face a different line of quizzing for every stage of his examination.

For example, at one stage of the trial, the test of the prisoner's sanity is whether he is capable of making a rational defense; at another, whether he is capable of understanding why he is being punished; at another, whether he knew what he was doing when he committed the offense, and if he did, whether he knew the act was wrong; and so on; for the law's definition of insanity shifts in different proceedings and at different stages. The test is never, whether the offender had or has dementia praecox or paresis, or some other such classification, questions in which the law has no interest except as they throw light on these lay and highly metaphysical matters.

WEAKNESSES IN THE COURT PROCEDURE SYSTEM

As one result of this condition, we receive these offenders in the state hospitals, not on the diagnoses made by the alienists at the trials, but on replies made by them to these test questions, about which they are little more capable of judging, distinguished authorities though they may be, than anyone else. To add to the farce, a lay jury weighs this evidence, and makes the final diagnosis of "guilty" for the sane, or "not guilty" for the insane; and so no wonder the psychotics often go to the penitentiaries and the malingerers to the

* From the office of the superintendent, Mendocino State Hospital, Talmage, California.
Read before the Neuropsychiatry Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2-6, 1937.

state hospitals. Also, not surprising that dangerous criminals get by with pleas of insanity, a year at the hospital, then release to prey upon society again. For this release the hospital authorities are usually blamed, though they have no legal right to hold them longer.

Another court proceeding which brings the psychiatrist into popular disrepute is the manner in which he must testify as an expert. Testifying on the opposing side perhaps are other experts. Because of this fact, and because, in border-line cases such as most of these defendants are, these experts disagree in their opinion, the public often insists such opinions are bought. While it is true, as in every trade or profession, there may be this venial type, it is far more true and common in practice that what the psychiatrists are disagreeing over is not the medical diagnosis but these non-medical questions which are put to them and which they are trying conscientiously to answer, such as "What is right?" "What is wrong?" "Did this defendant know he was doing wrong?"

REMEDIAL LEGISLATION NEEDED

Now all this may seem like a heavy criticism of our courts of justice, but it is not so intended and will not be so understood if we recognize that our penal system is based on the doctrine of responsibility for our acts. The only two large countries which have overthrown this doctrine of individual responsibility entirely are the State of Mexico and Soviet Russia. For the sake of providing a proper defense of these four hundred more or less unbalanced offenders, we would not desire to overturn our criminal courts. All we desire is remedial legislation. This system has its faults, among which are those I have related, but it is the solid foundation upon which our present social and moral life is built. It was a long step in advance when, upon this doctrine of responsibility of every person was grafted the new principle, that insane persons are not responsible and cannot commit a crime. The next step is for psychiatrists and jurists to come to a better understanding as to what insane people are. The difficulty is not that juries and the legal profession as a whole do not wish to meet the psychiatrists halfway. It is in accomplishing this purpose without infringing upon this doctrine of free will and responsibility, and without taking away a prisoner's constitutional right of trial by a jury of his peers, and superseding it with a trial by a jury of psychiatrists.

PROCEDURE IN CALIFORNIA

In short, the conflict between the two professions is a technical one chiefly, and not one of principle. California, we are proud to say, is one of the leading states in this effort toward reform, though there is still so much to be done. Our more eminent judges use every means within the principles and rules of present law to give the courts and juries the benefit of the judgment of the psychiatrist, and make use of his knowledge. California is one of the few states which has enacted a law making it the duty of the judge, when a defendant pleads "not guilty by reason of insanity," to appoint one or more psychiatrists as friends of the court to examine the prisoner, the theory being that such an appointment will preclude any question of bias on the part of such alienist and his testimony will thus become more valuable.

Also, many judges are commencing to see the value of sorting out the mentally unsound defendants before trial, rather than going through the ordeal of trial by a lay jury and having them found guilty, sent to the penitentiary and from there to the hospital, as often happens; and also doing away with the expense of a trial. This is a procedure that is specially urgent, and can be done without any infringement on any present law.

Also, our courts in California are inclined to discourage the determination of a defendant's sanity by the use of the hypothetical question on the witness stand, whereby an alienist draws his conclusion and makes a so-called diagnosis from the outline of the history of the case in a question drawn up by the attorney examining him. The tendency now is to provide for the examination of the prisoner himself by the alienist, the advantages of which are readily understood.

THE "1026 LAW"

An effort at reform was initiated by the Legislature and approved by the courts, but from the point of view of the psychiatrist it has proved far from successful. This is the so-called "1026 law," whereby under this section of the Penal Code a defendant must offer his plea of "not guilty by reason of insanity" as a separate plea, while formerly this question was tried along with his "not guilty" plea. If the jury finds him not guilty by reason of insanity, this law provides he shall be committed to a state hospital for one year, unless it shall appear to the court he has fully recovered his sanity. At the end of the year he may apply for release. If at the hearing he is found to be still insane, he is returned to the hospital. If recovered, he is discharged. He cannot apply for release again for another year if he is found to be still insane, and so on, yearly.

The purpose of the enactment was, doubtless, to prevent a defendant from walking out of the courtroom a free person after acquittal, and often a dangerous one; or if committed to a hospital because his insane condition still exists, to prevent him from applying for a writ of habeas corpus at once, and so securing release.

The principle seemed reasonable, but what has been the result? For one thing, this new law acts as an invitation for every criminal to use the special plea. Nothing is lost by making the plea and a great deal may be gained, for the matter of his guilt has already been tried. These defendants are usually border-line cases, often downright malingerers, or sometimes, persons actually sane for whom the juries feel a certain sympathy, so that they wish to ease down on the punishment by providing a year in the hospital instead of a term in the penitentiary. For, if the defendant has a well-defined psychosis, the judge will in all probability, on his own initiative, have a hearing on the prisoner's sanity before the trial for his offense,

and send him to the hospital, since a prisoner cannot be tried while insane.

On their successful plea of insanity, these individuals reach the hospital and at the end of the year they apply for release. Unless suffering from a definite psychosis, the hospital staff can only testify that they are sane, and the judge is bound to release them. So the problem of the abuse of the plea has not been solved, merely dumped into the lap of the state institution officials and the judge who must sign the discharge, against all of whom there is much public dissatisfaction expressed.

HOW THE LAW WORKS OUT IN PRACTICE

It is a common occurrence in the Mendocino County courtroom, where most of these applications for release are heard, for the witness to testify that he feigned insanity at his former trial, even show how he did it, and so the judge is forced to discharge him, since there is no evidence of insanity on which to hold him. This is no reflection on the psychiatrists who examined these defendants prior to their commitment, for they were committed upon the verdict of a lay jury. Further, the diagnosis of the examining physicians is usually based on a few hours' observation, when it should be at least a month's observation. It is made under the most unsatisfactory conditions, while these border-line cases and malingerers have usually spent a goodly share of their lives passing in and out of hospitals and penal institutions, and have an actual technique which they pass on from one to another, for getting into hospitals instead of jails and penitentiaries. In addition, is the problem of being compelled to keep these sane criminals in the hospital for the required year, as they are all potential escapes.

LAW SHOULD BE AMENDED

For these reasons, we feel that the law should be amended and supplemented by provision that, before a prisoner is tried upon his insanity plea, he shall be sent to a state hospital for one month or longer, if possible, for continued observation. If found actually suffering from a mental disease, he could be detained until recovery without the expense and ordeal of a trial, and then be tried on a fair basis. If found sane by the hospital staff, his opportunity for escaping by means of an insanity plea would not be so favorable. Also, justice would be done to that type of offender who is actually suffering from a psychosis, but who, due to popular feeling against his anti-social act, is often dealt with most unjustly.

Colorado, Ohio, Maine, Vermont, and New Hampshire have such a law, committing the defendant to a state hospital for observation if he pleads insanity as a defense. Colorado and Ohio provide that the detention shall not exceed one month's period; Maine and Vermont provide that the judge may (not must) order the defendant into the care of the hospital superintendent "until further order of the court, that the truth or falsity of the plea may be ascertained." New Hampshire has a similar law. Experience in other states having proved such legislation practical, an attempt was made to introduce a similar law by a bill submitted at the last session of the Legislature here in California. But the attempt was unsuccessful, though we are hoping it may be accomplished next term.

OTHER REFORMS

There are other reforms which it is hoped may be introduced into the California law, with a view to bringing it more into step with modern psychiatry. The legal court test of insanity in a trial for an offense in this state is whether the person was so disordered in mind when he committed the act as not to know the nature and quality of it, or if he knew this, did he know that the act was wrong? The answer to these questions by the psychiatrist must be "yes" or "no." The defendant must be found either responsible and, therefore, sane or irresponsible and, therefore, insane, to meet legal requirements in most of our states, including California.

In some states the test has been modified to include the test of the defendant's volitional powers, the so-called "irresistible impulse" test; in some states the doctrine of partial irresponsibility is indirectly accepted, but only in mitigation of punishment, when records or testimony may be presented to the judge after trial and before sentence. A famous case where this was done was at the Loeb-Leopold murder case in Chicago. In California, as in most states, it is not permissible. Also, in California and most states, a person with insane delusions is legally sane and irresponsible in spite of them unless the facts of the delusion, if true, would justify a reasonable man in committing the offense. That is, a person with delusions is guilty unless he acts like a reasonable man! There are other tests which time will not permit us mentioning, but which are in need of modification. Back of all these efforts at change is a desire to amend the old conception that man is all conscience and intellect, and give recognition to the compelling power of the emotions, just as modern psychiatry is doing.

THE MASSACHUSETTS LAW

This paper would be incomplete without a paragraph concerning the Brigg's Law of Massachusetts, which we hope may be a pattern for a similar law in this State. It is based on the principle of an automatic examination for all persons who have committed major crimes, and for recidivists. This examination is made by the psychiatrists who are appointed by a professional organization—the Department of Mental Diseases of the Commonwealth—and who are both representatives of the court or of either party, thus removing the report from suspicion of bias. The records are kept by the State Board of Probation, and are accessible to the District Attorney, attorneys for the defense in any trial, and, of course, the judge. They also reach the jury, as the examining psychiatrists may be summoned by either the defense or the prosecution. The statute is worded so that the question of whether the mental disease would affect the subject's criminal responsibility is decided in advance of the trial. If the defendant is found to

be suffering from mental disorder, he is immediately committed to a hospital until his recovery. Some of the advantages are elimination of a trial by jury when the psychiatrists pronounce the offender insane, savings to the State in expense of trial, lack of opportunity to feign insanity, plenty of time for observation on the part of the examining psychiatrists, and humane treatment of the insane criminal. Such a change in our law would also benefit that type of defendant who, though pronouncedly psychotic, shows no symptoms to the lay mind, so that even his attorney oftentimes does not suspect his condition and advises a plea of insanity. Thus, a victim of ignorance, he may plead guilty or be found guilty wrongfully. Mr. Winifred Overholser, Commissioner of the Department of Mental Diseases of Massachusetts, just resigned, has issued a most interesting booklet of the operation of this law. The Criminal Law Section of the American Bar Association has recommended that the scope of the statute be extended to include all felonies. We, who are specially interested, hope its principles may be enacted into the laws of our State.

I have desired, in this paper, to point out a few of the difficulties the psychiatrist must meet when called upon to examine offenders and testify in court concerning their mental condition; and to suggest a few much-needed reforms.

IN CONCLUSION

In conclusion, I would ask that you give all the assistance you can to the efforts being made to induce the Legislature to support these reforms; particularly the enacting of a law providing for the examination of the offenders pleading insanity by psychiatrists with plenty of time for observation at a state hospital. I have attempted to show the special need for this legislation, and, with sufficient support and interest, it can be accomplished. I thank you for any coöperation you can give and for the considerate attention you have shown me today.

Mendocino State Hospital.

DISCUSSION

Edward W. Twitchell, M.D. (909 Hyde Street, San Francisco).—It is quite true that the term "criminal insane" lacks in many respects of being perfectly suitable. That is true of a great many terms in common use, but they are continued until an acceptable substitute is found.

While it may be true, from a legal point of view, that the term is inconsistent and that, legally, one cannot be insane and criminal at the same time, in actual fact it is true that one can be insane and criminal at the same time. There are many insane, even insane who are in state hospitals, who in spite of their psychotic condition, if the term "insanity" be objected to, have an excellent understanding of what is right and wrong, and are able to control themselves so far that they refrain from doing wrong. There is many a paranoid who believes himself to be persecuted, but does not attack his persecutor because he feels it wrong to disobey the laws; while, on the other hand, there are those who are quite aware that their mental condition is a protection to them and would take advantage of it to commit all sorts of illegal acts. The vast majority of the insane, of course, are without the ability to reason correctly and are admittedly irresponsible.

The duty of the psychiatrist in court is to aid the court and the jury to determine this responsibility or irresponsibility. The method at present in use in this State is not calculated to give the courts the aid that they need. It was thought a great step had been taken forward when judges were ordered, in all cases of doubt, to appoint three psychiatrists to examine the accused who pleaded not guilty by reason of insanity. This is correct in purpose, but it does not always work out well in practice because, for one thing, judges are not always good selectors of psychiatrists. The judge may think his personal friends are excellent psychiatrists, while actually they may be incompetent, and though, as is mandatory, one of those selected must be from the staff of a state hospital, not every member of the staff of a state hospital is necessarily a good forensic psychiatrist. The result is often that the commission of three is entirely dominated by one who is followed obediently and blindly by the two others.

Even if the commission were all your fancy paints, this commission has inadequate time and opportunity for examination. The attorney for the defense has told his client, under no circumstances to permit examination by the doctors appointed by the court, so the doctors appointed by the court must report without having had opportunity to make any sort of physical examination or even a proper mental examination, and their opportunity for getting family and past history may be so small that they are practically ignorant of the prisoner's antecedents and personal history. The attorney for the defense will not permit this examination because he regards the doctors appointed by the court as too close to the district attorney, and he will not trust the district attorney. Experience has taught him that district attorneys are not always to be trusted. Two ways out of this difficulty have apparently been found: one in the Briggs law and the other the Colorado procedure, where the patient is put for a month in a state psychopathic hospital for observation, that the staff may report to the court at the end of this period of examination. As compared with our present-day methods, there is no question that either one of these is preferable to our own.

❦

A. M. Kidd, Professor of Criminal Law, University of California, Berkeley).—Ideal legislation on the subject of insanity as a defense to crime presents constitutional problems, as well as the difficulties of persuading the people that it should be adopted. There is, however, a practical solution, which should work pretty well, utilizing the law as it now stands with very little change. Accept the right and wrong test to its fullest extent. Practically every defendant who comes before the court possesses that minimum. In fact, there are very few inmates of the state hospitals for the insane who do not know that the common crimes are forbidden by law. Those who are obviously so far mentally alienated that they do not know the difference between right and wrong are not tried. The judge and the district attorney recognize their condition, and send them to a state hospital. As Doctor Cushman says, "If the defendant has a well-defined psychosis, the judge will in all probability, on his own initiative, have a hearing on the prisoner's sanity before the trial of his offense and send him to the hospital, since a prisoner cannot be tried while insane." With a month's observation, as Doctor Cushman recommends, the result would be a larger number of cases sent to the hospital without trial.

In the cases that are tried, the defendant can and should be convicted. The evidence of a psychosis, unless it goes to the length of establishing that the defendant did not know that what he did was contrary to law, should be of no importance on the trial. Something has been made of the theory of the power to choose, but, as has been said: "Whatever the compelling power of the emotions, the defendant still knows what is right and what is wrong according to law. The absolutely irresistible impulse is an extreme abstraction." By applying the right and wrong test literally, practically every defendant who comes to trial would be convicted and would be detained for an indefinite term with a high maximum, for the maximum penalties in California are very high.

Moral responsibility is a theological question to which the law can give no answer. Unquestionably, the man with bad heredity and environment, suffering from a psychosis, even though he knows the law of the land, is not as responsible as the winner of the Eugenic Prize. But the law can do nothing about this difference. The fact is that the former is dangerous to society and the latter is not.

The next important step is to hold in an adequate institution for the criminal insane, those who have definite psychoses and would be benefited by their treatment in such an institution. In 1905, an institution for the insane person charged with felony was provided for by an act of the legislature. The building was started, but not completed. The location was at Folsom, an obviously undesirable place. A suitable building in a suitable location should contain a block of maximum security cells and detention places down to minimum security, according to the condition of the patient. Doctor Cushman and an architect would have no difficulty in designing such an institution. The present hospital at Ukiah is not equipped for persons with criminal tendencies and the ability to escape, and too many of the staff are political appointees. Much of the criticism of the present law arises from that fact. Not so many years ago a defendant, a colored man, was found insane and sent to Ukiah. In a few weeks he was back again before the same judge. The judge asked for an explanation. The defendant gave it. "I was in the yard and an attendant came up and says to me, 'Nigger, you ain't crazy.' 'Why, yes I is,' I says. 'See here, Nigger,' says he, 'I am going away and I am not coming back for fifteen minutes. If you are here when I get back, then you *are* crazy' and, Judge, when he came back I wasn't there."

An institution, properly built and staffed, would solve most of the problems, with no change in the law. The solution does not differ substantially from the English law. There the jury is permitted to find the defendant guilty of the act, but so insane as not to be responsible according to law. The court then orders the prisoner to be kept in custody as a criminal lunatic until His Majesty's pleasure shall be known, and His Majesty is pleased not to release him. The result is that the defense is rarely made by defendants except in capital cases. A conviction for robbery or burglary involves perhaps a two- or three-year sentence to prison, but a finding of guilty but insane means detention for life.

If the medical experts knew that a defendant found guilty under a right and wrong test would be put in an institution for the criminal insane if suffering from a psychosis and in such institution would be cured, if possible, otherwise detained for the maximum term, there would be less reluctance to find the defendant sane according to the law. Under the law as it is at present, the experts for both sides, if reasonably competent, usually agree as to what is the matter with the defendant medically, but the prosecution experts say he knows the difference between right and wrong in relation to the law of the land as applied to the act that he did. The defense experts say that may be so, but a man so seriously diseased ought not to be sent to prison. The absurd hypothetical question makes a difference appear between the experts, where there is none in fact. The defense counsel consumes a couple of hours in reading a question embodying all the testimony favorable to the defense and omitting everything else. The answer of the experts to such a question is, naturally, that the defendant is insane. The prosecution presents its side of the testimony in a similar hypothetical question embodying the testimony for the prosecution and, obviously, the answer is that the defendant is sane. The experts are made to appear in opposition, whereas neither has had an opportunity to answer a question as to the actual state of the defendant based on the evidence and personal examination. Fortunately, as Doctor Cushman points out, reasonable judges are now utilizing the reports of competent nonpartisan experts. The recent power of the judge to comment on the evidence gives him the opportunity to tell the jury the truth about the hypothetical question.

❦

Milton B. Lennon, M.D. (384 Post Street, San Francisco).—Doctor Cushman's wide experience with the problems of the so-called "criminal insane" gives him the halo of some authority.

We who have had but a minor experience have a sense of overwhelming insufficiency when we view the problem. Its facets are many. The legal side is mixed up with the medical aspects, and yet a certain deal of common sense should help to solve the question. The rights of the individual and of the public must be conserved.

A man is indicted as the perpetrator of a crime. The judge may recognize the fact that he has a psychosis, appoint a psychiatric board, have an investigation, and immediately commit him to a state hospital.

Another indicted individual may make a twofold plea: First, "Not guilty," and second, "Not guilty by reason of insanity." He and his lawyers have a dual purpose. If he is found guilty a second trial on the insanity plea is made, with the hope that the jury will find a verdict of insanity, and that, instead of a long sentence in prison, he will be sent to a state hospital. At the end of a year he can start proceedings to be discharged from the state hospital. Remember, that a lay jury has brought in the verdict of insanity, and that at times this is done in the face of unanimous medical testimony to the contrary. Careful study during the year's stay at the hospital may fail to disclose any psychosis, and hence the superintendent has no alternative than to discharge the patient.

Again a man may be adjudged insane by the jury, and this time in conformity with the medical evidence. At the hospital careful study by the superintendent and his staff may lend further evidence of a psychosis. Even such an individual may, at the end of a year, bring legal action and attempt to be discharged. What is more, men have succeeded in regaining their freedom despite the protests of the hospital superintendent. Now such things do not happen often, but they never should happen.

There should be no double plea, and if there is the usual second part should take precedence over the first. If the plea is made of "Not guilty by reason of insanity," I am in hearty accord with Doctor Cushman's valuable suggestion. An intensive psychiatric study of the individual should be made. In some instances a conclusion can be quickly reached, in others only a time-consuming investigation will lead to a logical diagnosis. Hence, the period of stay at a hospital should be left entirely to the discretion of the superintendent. In this way no psychotic patient will find himself in jail. The malingerer will be ferreted out by observing eyes.

We of the medical profession should use every means to bring about legislative action that will further Doctor Cushman's proposal.

Equally important, in my opinion, is a change in the law that permits a patient to take legal steps toward his discharge at the end of a year. A longer period, say of five years, should be substituted before such an action is permitted. The matter should be far more a medical than a legal question. A proviso might be made that, after a year and at the discretion of the superintendent, a patient may be discharged if the psychosis is cured, and no superintendent would hold a patient if such were the case.

COCCIDIOIDES IMMITIS INTRADERMAL SKIN REACTION*

A PRELIMINARY REPORT OF 449 CASES

By Samuel Hurwitz, M.D.
John Edward Young, M.D.
and
Bernice U. Eddie, M.A.
San Francisco

THE purpose of this paper is to evaluate the coccidioides skin test as a diagnostic measure. To our knowledge there has been no previous similar report in the literature. Jacobson,[1] using a filtrate of a coccidioides growth on Sabouraud's bouillon, tested six noninfected persons and obtained negative results except in one case of blastomycosis. A positive reaction resulted in six patients with coccidioidal granuloma. He stated that coccidioides immitis produces a filterable substance

* From the Department of Pediatrics, and Hooper Foundation for Medical Research, University of California Medical School, San Francisco.

Note.—Since this paper was submitted for publication we have encountered a case of coccidioides of the lung in a white male, proved by biopsy, which gave a negative skin reaction.

which gives a characteristic skin test on patients with coccidioidal granuloma, as does tuberculin on patients with tuberculosis. Cooke[2] using (*a*) a filtrate, (*b*) an emulsion of mycelia, and (*c*) a suspension of spores, both intradermally and by the Von Pirquet method, obtained positive results on a case of coccidioidal disease and six controls. He concluded that there is no specific skin reaction in coccidioidal granuloma. Hirsch and Benson,[3] on the other hand, concur with Jacobson[1] that coccidioides immitis, cultured in liquid media, produces a soluble specific substance that yields a cutaneous reaction in infected persons. Furthermore, Hirsch and D'Andrea[4] found that guinea pigs could be sensitized with broth culture filtrates of coccidioides immitis and killed dried mycelia. Positive skin reactions were obtained with different strains of the mold, thus showing that there is no specificity of strain. The testes of sensitized animals produced acute inflammatory exudates in the presence of antigen, so that these observers believed the skin reaction to be on an allergic basis probably.

METHOD

The material used in this study was prepared in the following manner. An old broth culture (1925) of coccidioides immitis, mycelia and spores, isolated from a patient with the disease, was heat-killed, dried and suspended in normal saline. Phenol was added as a preservative. The material was standardized so that each cubic centimeter of solution contained 0.1 milligram of the culture.

One-tenth of a cubic centimeter of the above material is injected intradermally on the flexor surface of the forearm, and the reaction is read in twenty-four, and again in forty-eight hours. Normal saline is used as a control. A positive reaction consists of an area of induration 5 millimeters or more in diameter about the site of injection at the end of the forty-eight-hour period.

DISCUSSION

This series comprises 449 tests done on patients ranging in age from ten months to eighty-five years, and hospitalized in San Francisco, San Joaquin, Kern, and Fresno counties. In this group there were twelve cases of coccidioidal granuloma, 177 tuberculous infections, and 260 miscellaneous diseases. The coccidioides cases cited above were proved either by identification of the organism from the lesions or by autopsy. Table 1 lists the incidence of positive skin reactions in various conditions.

TABLE 1.—*Incidence of Positive Coccidioides Skin Test*

Classification	Total Number of Cases	Number Positive	Per Cent Positive
Coccidioides	12	12	100.0
Tuberculosis	177	49	27.5
Other diseases	260	11	4.2
Total	449	72	16.0

TABLE 2.—*Coccidioidin Reactions in San Joaquin Valley and Other Areas*

Location	Total Number of Cases	Number Positive	Per Cent Positive
San Joaquin Valley	184	37	21.0
Other areas	253	24	9.5

The coccidioides intradermal skin reaction was positive in all twelve patients with proved coccidioidal granuloma. Previously, Miller[5] had pointed out that a positive skin test is invariably obtained in patients with the disease.

A striking feature of our results is the high incidence of positive reactions in tuberculosis. Beck, Traum, and Harrington[6] have called attention to the close relationship between the tuberculin and coccidioidin tests in animals. They observed positive tuberculin reactions in guinea pigs injected with coccidioides immitis. Further investigation of the interrelationship of these two diseases should be attempted.

Occasional positive skin tests (4.2 per cent) were obtained in a group of 260 patients with miscellaneous diseases other than tuberculosis or coccidioides. It may be that a diminution in concentration of the material employed will reduce or eliminate false positive reactions. Further study along such lines is contemplated.

San Joaquin Valley is regarded as an endemic area of coccidoidal granuloma, and a comparison of the results of intradermal skin tests in this region with the other areas is shown in Table 2.

In 184 patients without a previous history or evidence of a coccidioidal infection, resident in the San Joaquin Valley, there were 37 (21 per cent) positive reactors, while in a group of 253 cases living in other regions of the State only 24 (9.5 per cent) were positive. The incidence of tuberculous infection was approximately the same in both series. These results are interesting in view of the fact that it has been suggested[5] that perhaps in endemic areas some inherited resistance may be built up through many generations, or some people may acquire coccidioidal granuloma in a mild form from which they recover and develop a resistance. However, the mechanism of immunity in coccidioidal granuloma remains still unsolved.

SUMMARY

Intradermal skin tests with killed coccidioides organisms were carried out on 449 hospitalized patients. All twelve patients with proved coccidioidal granuloma reacted positively. Positive reactions were obtained in other conditions, particularly tuberculosis. A higher incidence of positive reactors was found in noninfected residents of the San Joaquin Valley, an endemic area, than elsewhere in the State.

PHASES OF ADOLESCENT DEVELOPMENT IN GIRLS*

By Helen B. Pryor, M.D.
Stanford University
AND
Harold D. Carter, Ph.D.
Berkeley

Discussion *by H. Lisser, M. D., San Francisco; William Anthony Reilly, M. D., San Francisco; H. E. Thelander, M. D., San Francisco.*

THE present report is concerned with the significance of individual differences in body build as a factor in growth and development. Physical, physiological, and observational records of a group of about one hundred girls furnish the basis for the study. The physical data include anthropometric measurements, clinical physical examinations, observations, x-rays, and serial photographs. The children studied here, as a part of the seven-year study of adolescence being carried on at the Institute of Child Welfare, have been examined each six months, beginning at the age of approximately ten years.

The longitudinal method has been used, the development of each child being followed over a period of several years. This has required the maintenance of cumulative records, and makes possible both the consideration of status at successive age levels, and of cross-sectional as well as longitudinal relationships. Interrelationships between several of the different types of data have been traced.

As a technique for exploration of relationships, a group of girls of extremely slender build have been contrasted with another group of girls characterized by extremely broad body build. These two samplings at the extremes of the normal distribution were selected [1] on the basis of an index of body build, consisting of bi-iliac diameter divided by standing height. Data from the two contrasted groups reveal certain significant relationships between the anatomic measures and physiological variables. The two groups of children have characteristically different growth patterns. The findings suggest that, in studies dealing with growth and development, proper interpretation of the data from a random sample requires the recognition and measurement of individual differences, and proper allowance for certain individual patterns of growth.

THE ASSESSMENT OF GROWTH

In the measurement of growth, it is necessary to recognize a number of variables in addition to actual stature or size. The important thing in growth is the maintenance of an adequate rate of progress, normal for the individual, rather than the attainment of uniform size for all individuals at a given age. It is necessary to recognize big-boned family lines and small-boned family lines, as well as the stunting effects of certain serious illnesses. In the present study, interviews with the parents were held in order to gather information on family heredity, as a help in recognizing growth patterns.

The use of x-rays in study of physical growth is comparatively recent, but various methods of measuring the extent of ossification have been devised in order to assess development.[2-4] Appearance of centers of ossification, stages of fusion of epiphyses with their diaphyses, total carpal area, and diameters of the carpus have all been used by various authors to estimate anatomic age. Todd [5,6] used centers of ossification in shoulder, knee, and foot, to supplement hand and wrist in order to judge skeletal development. Both Rotch [7] and Stevenson [8] have demonstrated the wrist to be an adequate indicator of the ossification in all the epiphyses in the skeleton. Since this area can be x-rayed with the least expense or inconvenience of any part of the body, it is the one now generally used. The wrist is a satisfactory area in which to study ossification, because, while cartilaginous at birth, it has eight bones at maturity, and hence in the transition it exhibits many stages of development.

Centers of ossification appear in definite sequence, and failure to appear when they should indicates an illness at or near the time of appearance. The ends of the long bones, particularly the tibia, and the radius, are marked with rings which show pauses in the bone growth following severe measles, scarlet fever, or other long-continued fever. Children from slum districts show more developmental scars of this type than do those in better homes.

The various retardations in development due to illness may be responsible for some of the irregularities in growth noted during the adolescent period. These irregularities are no doubt related to the awkward phases of imbalance between bone growth, muscle growth, and endocrine or organ maturity. The awkward stage of stress and strain is more marked in early adolescence, and disappears as irregularities in growth diminish.

X-rays show no distinction in amount of ossification in boys and girls up to five years. By age ten, the girls show quite a developmental spurt, and the girls finally attain their mature form before boys. The female skeleton reaches approximately its adult level at about fifteen years, when the epiphyses close and there is no further growth in stature. In boys, adult stature and skeletal weight are not attained until age eighteen.

We have used the appearance and growth of centers of ossification in bones, to measure physical

TABLE 1.—*Means and Standard Deviations of Distributions of Anthropometric Measurements of Ninety-three Twelve-Year-Old Girls*

Per cent breadth and length	– 7.5	– 12.2	– 4.3

* Girls who were 1½ standard deviations narrower than the average were classified as belonging in the extreme "Linear" group. These data are to be compared with Table 3, which gives similar measurements for the nine girls classified as "Lateral."
Body weight is recorded in kilograms; other anthropometric measurements are recorded in millimeters.

development, following the technique described by Dr. T. Wingate Todd, who has studied the problem extensively over a period of years.

In this series of data, a skeletal age difference of three and one-half years is the maximal difference between the most accelerated and the most retarded bone-ages at a given chronological age. This indicates the great extent of individual differences in skeletal development at a given chronological age. A child whose skeletal ossification exceeded or lagged behind the mean of her age-sex group by more than nine months (three times the standard deviation) was classed as of accelerated or retarded development, respectively. Children were classified as average, who did not exhibit as much as nine months' acceleration or retardation.

THE MEASUREMENT OF BODY BUILD

As a part of the measurement procedure every six months, a series of anthropometric measurements was taken. (See Table 1). These included measures of both length and width, and provided the basic data for determination of body build, the

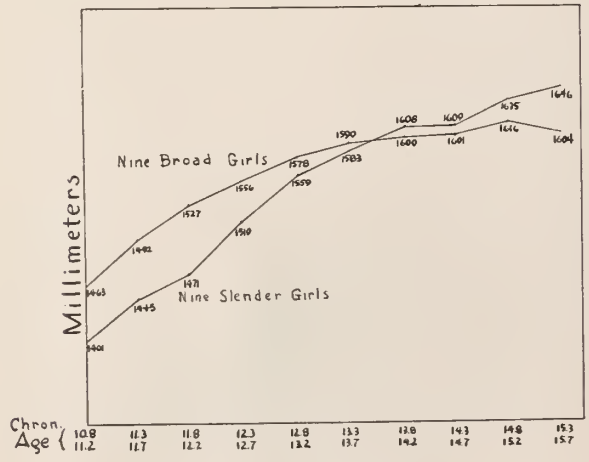

Chart 1.—Growth curves height.

computation of a convenient index of body build, and the selection of groups of individuals to exemplify the extremes of the distribution.

The normal sampling of girls at a given chronological age (*e. g.*, twelve years) shows a wide range of variation in each of the measures used. We have been especially interested in subsamples, selected from the extremes of the distribution with respect to body build. A classification into lateral (broad-built) or linear (slim) groups, based entirely on width-length indices,[9] has been used in selecting the subsamples. The measure employed is bi-iliac diameter divided by standing height. Girls who varied as much as 1.5 standard deviations from the mean in either direction were included in the extreme groups, used for a number of preliminary investigations.

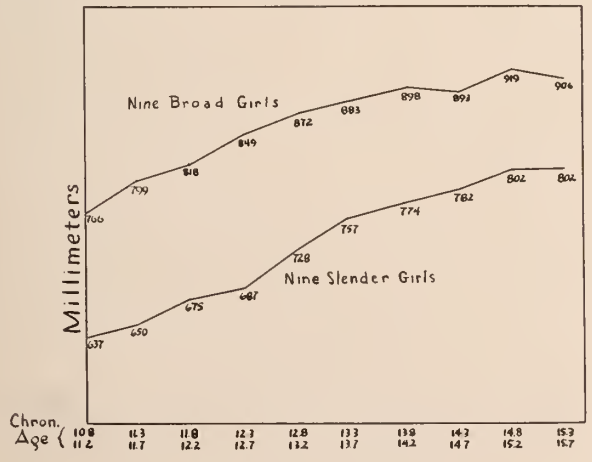

Chart 3.—Growth curves chest girth.

In Table 1 are given the means and standard deviations of anthropometric measurements of ninety-three twelve-year-old girls. These data are used as a general basis for comparison. Tables 2 and 3 show the same measurements for the linear-type and lateral-type girls, respectively, in the same series, and hence the three tables record the extent of variation in the normal sample, and the nature of the groups used to illustrate the extreme variates. Charts 1, 2, 3, and 4 are graphic representations of differences in body measurements between

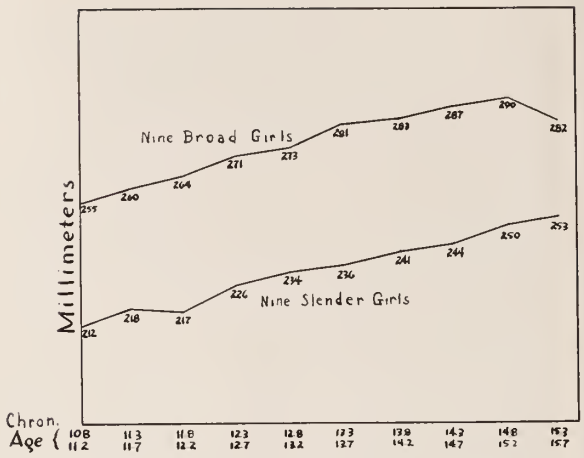

Chart 4.—Growth curves bi-iliac diameter.

linear and lateral groups of girls for a period of four years.

Using this lateral-linear classification, based entirely on width-length indices,[9] it is interesting to note that fifteen anthropometric measurements fall in line consistently year after year, with almost no overlapping. This is an indication of harmony and consistency, which supports the hypothesis that the two selected extreme groups differ in total body-build pattern, and not merely in one or two dimensions.

CLINICAL MEDICAL EXAMINATIONS

At the time of the regular physical examinations, observations were made of general health conditions, colds and other infections, posture, strength, muscular tone, and nutritional status. In addition, records were kept of handedness, eyedness, scapular type, and other conditions relating to development, coördination, and general health. Ratings were made of developmental conditions diagnostic of maturation, such as presence and amount of axillary and pubic hair, development of breasts and of subcutaneous tissue in other areas, and the time of establishment of catamenia. Photographs taken at these regular intervals furnish a permanent record of many of these facts, and of additional configurational factors difficult to describe other than by photographs.

Figures 2 and 3 are outline drawings of a linear type and a lateral type girl, respectively, showing the same girl at successive six-month intervals in each case. These figures portray aspects of growth characteristic of persons in the two classifications. Tracings were made of standardized photographs, to obtain the outlines, and the meanings of the various labels are as follows:

1. Height deviation range—percentage above or below average.
2. W/H index range—percentage broader or narrower than average.
3. Scapular type—CC (concave), CV (convex), and St. (straight).
4. Handedness—right or left.
5. Eyedness—right or left.
6. BMR range—highest to lowest.
7. Joint maturity x-ray—appraisal of ossification of the hand.

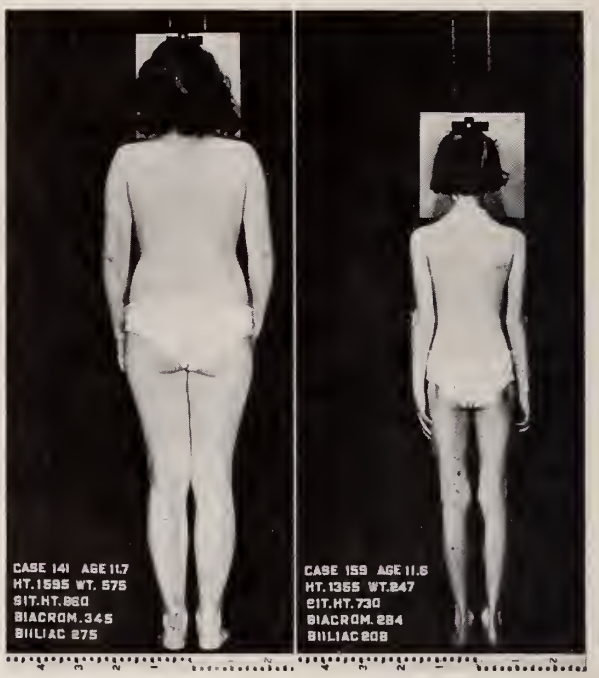

Figure 1.

Axillary and pubic hair, and size of breasts were rated as previously described.[1] The time of establishment of catamenia is indicated by a star on the figure. The five outline columns represent percentage increase over previous six months in bi-acromial diameter, bi-iliac diameter, height, stem length, and girth of calf, respectively.

The average age of appearance of catamenia in the broad-built group was 11.7 years, while the average age in the slender-built group will be over fourteen years. The exact average for this latter group cannot be calculated at present, because some of them have not yet menstruated.

There was very little growth in height in the broad-built girls after appearance of catamenia, while growth in height increased regularly in the slender girls of the same chronological age. Growth in diameters and girths slows up markedly in the broad-built girls during the same period of time that the slender girls start their adolescent spurt in growth.

Study of the results of these clinical medical examinations shows that some of the great variation in human growth at puberty is due to the mixture of the different types, one of which grows rapidly at age eleven to twelve years, and reaches full stature. The other type begins the adolescent spurt one to two years later, grows more slowly, and matures later.

In the present-day enthusiasm for establishing standards of growth and development, and for regimenting school children, the importance of individual differences is often overlooked, or inadequately considered. The general attitude that all persons are to be evaluated by reference to the same standards, when applied to physical and medical data, works an injustice on those individuals who vary from the average to a marked degree. In many individuals, growth follows a course quite

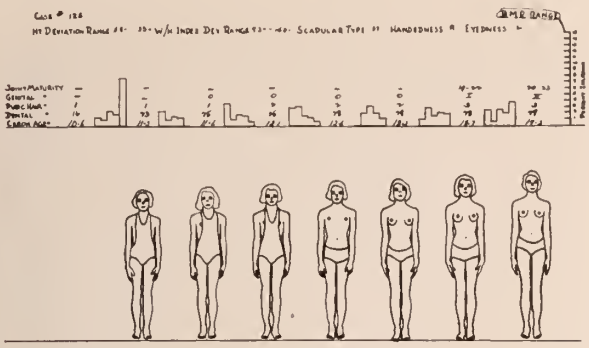

Figure 2.

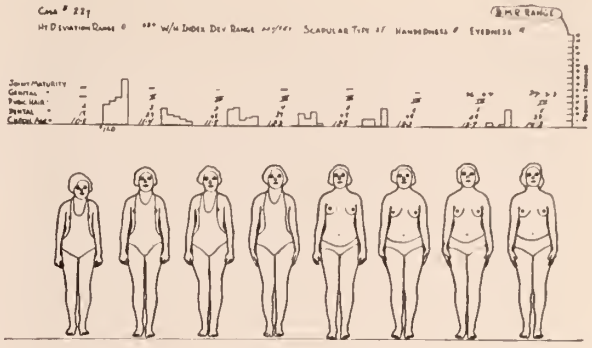

Figure 3.

unlike that of the average person, but entirely normal for the individuals concerned.

INTERRELATIONSHIPS

Figure 1 shows standardized photographs of a linear and a lateral girl, matched for chronological age. The slender-built girl lagged behind the broad-built one in ossification two and one-half years, and in establishment of catamenia four years. These photographs illustrate the sort of developmental difference associated with difference in body build.

Table 4 shows chronological age, assessment of bone development, age equivalent, and age ratio, for all of the very broad and very slender girls in this series, compared with the averages for the whole series. All of the lateral group of girls had accelerated bone development, and all of the linear group had retarded bone development.

Hence, in addition to individual divergencies from average, which might be due to acute diseases, there appears to be a body-build difference in ossification. The x-ray studies of our adolescent group show that ossification proceeded more rapidly in the broad-built than in the slender-built. In the latter group, epiphyseal ossification consistently lagged behind that in the broad-built group. The evidence for the two groups is shown in Table 4; the picture is consistently similar to that of the cases used in the illustrations of Figure 1.

SUMMARY AND CONCLUSIONS

As part of the larger study of adolescence being carried on at the Institute of Child Welfare, a longitudinal study of physical and physiological aspects of growth and development of one hundred girls has been included. Retests at six-month periods over a period of several years have included anthropometric measurements, clinical physical examinations, observations, x-rays, and the taking of serial photographs. The analysis of the cumulative records justifies the following conclusions:

1. Individual differences must be recognized in the assessment of growth. The important thing is the maintenance of an adequate rate of progress, and not the attainment of an absolute stature or size.

2. When body build was classified entirely on the basis of width-length index, study of extreme groups revealed interesting consistencies in other measurements, in relation to body build. In each of fifteen anthropometric measurements, wide differences were observed between broad and slender girls, with no overlapping at any point.

3. Study of the records indicates that physiologic development parallels rather closely anatomic development. Marked differences in rate of maturation were observed, as the broad-built girls matured at an earlier age than did the slender girls.

4. When x-ray methods were used to assess development by estimating anatomic age, a body-build difference in time and rate of ossification was demonstrated. On the wrist assessments of anatomical age from x-rays, broad-built girls had age equivalents greater than their chronological ages, and slender-built girls had age equivalents less than their chronological ages. The age ratios, when averaged, were 109 for the broad-built and 96.1 for the slender-built girls.

5. The data led to the conclusion that the mixture of groups of individuals heterogeneous with respect to body build accounts for some of the great variation in human growth at puberty, when observed in any ordinary unselected sampling.

DISCUSSION

H. Lisser, M. D. (384 Post Street, San Francisco).—This study distinguishes, with great clarity, two widely different types of skeletal growth in *normal* adolescent girls—the "lateral" or broad-built group and the "linear" or

slim-slender group. Merely calling attention to broad and slender skeletal patterns would elicit little interest if it were not for the fairly consistent, associated distinctions involving the degree of osseous development or "bone-age" and the concomitant sexual age. These latter findings are of trenchant significance, for they emphasize, even in *normal* girls, the intimate inter-relationship between sexual maturity and termination of growth. Thus, if the menarche occurs for instance at twelve years of age, the "bone-age" will probably be nearer fifteen years, and longitudinal growth will practically cease when this girl reaches the age of fourteen. This study points out that this combination of events is most frequent in the broad-built type of girl who matures relatively early and, therefore, stops growing comparatively early. Contrariwise, the slender-type girl matures later, at fourteen or fifteen years of age; her "bone-age" is apt to be slightly retarded in comparison to her chronological age, and the onset of menstruation and fruition of secondary sex characteristics will be correspondingly delayed. Yet, both these extremes are fairly common and within reasonable limits may be considered normal.

The recognition of these two divergent types in *normal* girls, with accompanying differences in osseous and sexual development, leads to a consideration of these two types when exaggerated to a degree interpreted as *abnormal* or pathological. In addition to normally inherited, constitutional factors influencing skeletal patterns, attention must be paid to the dominating rôle of the endocrines in controlling growth and sexual development. Thus, a granulosa-cell tumor of an ovary producing precocious sexual maturity, with onset of menstruation during the first few years of life, will stimulate rapid skeletal growth at first, but with advanced ossification and premature closure of the epiphyses resulting in early cessation of growth. Similarly, an adrenal cortical tumor originating in a little girl causes a pseudo-sexual precocity, with early appearance of pubic hair, enlarged clitoris, accelerated skeletal growth and again advanced "bone-age" with eventual shortness. The skeletal set-up of such girls is apt to be "lateral," broad-built, or heavy, a pathological exaggeration of what the authors described in normal adolescent girls. Such girls at a chronological age of five years, may have a "bone-age" of twelve.

On the other hand, the antithesis of such precocious ripening is exemplified in preadolescent eunuchoidism, the clinical picture of which is typified by eunuchoid-tallness (not true gigantism), with disproportionally long extremities, slenderness, severe delay in appearance of secondary sex characteristics, very late onset of menstruation, if at all, and in unison, extreme retardation of ossification. This type of endocrinopathy would be illustrated by a girl of twenty-four years, with no mammary development, with very sparse pubic hair, who has not menstruated, with span greater than height and lower measurement far exceeding the upper, and with an osseous status of twelve years.

In the previous two paragraphs endocrinopathies have been described which illustrate extreme exaggeration of the two normal types defined by Drs. Pryor and Carter. The discussant has studied a considerable number of such patients, but so severe disturbances of endocrine function are uncommon. Manifestly, however, instances of milder deviation, between the extremes of normal and grossly abnormal, are to be expected, and are encountered quite frequently. Proper recognition and appropriate therapy can be extremely helpful.

It is to be emphasized, therefore, that the authors' careful observations in normal adolescent girls corroborate the important corelations, long known to endocrinologists in more outspoken form, between skeletal patterns, "bone-age," and the degree of sexual maturity. Broad-built girls mature early, and grow very little after thirteen years of age, whereas linear slender girls mature relatively late and, therefore, are still growing at sixteen. "Bone-age" estimations should be utilized more frequently in pediatric practice. The thyroid, pituitary, adrenals, and gonads have important influences in accelerating, delaying, or arresting both skeletal growth and sexual maturity.

❦

William Anthony Reilly, M. D. (384 Post Street, San Francisco).—From Doctor Pryor's significant and interesting findings practitioners should recognize several helpful trends. These are: That there are individual differences in body-build (linear, lateral, and mixed); that it is incorrect to consider only a mean or an average for the growth factor of height, weight, epiphyseal age, pulse, blood pressure, basal metabolism rates, etc.—in place of means or averages we should always consider the limits of the range of findings; that there is a difference between chronological age and physiologic or anatomic age—the latter including maturity, bone-age, etc. Such proven facts help the practitioner allay the fears of family, teacher, and school nurse, concerning normal weight and the like. If one takes into consideration skeletal build (and especially the height-width index), the child very often is quite normal in weight.

I believe pediatricians, especially, are making more use of these findings. It will be practically helpful to practitioners when standards for basal metabolism can be computed on body-build better than at present.

Of personal interest to me is the finding that broad-built girls often have the following findings—they are mostly of European stock, with marked acceleration of bone-age, tall and obese, and some years premature physical and gonadal maturity. They have a definite tendency to a lowered basal metabolism. Physical measurements, examination of the genitalia, and glucose tolerance tests were uninformative. Tests for growth and sex hormones gave negative results. I have never been able to ascribe a definite physiological reason for these findings.

❦

H. E. Thelander, M. D. (384 Post Street, San Francisco).—The recent tendency to study intensively the individual and his variation from the mean cannot be too highly commended. Problems arise in individuals and not in masses, and it is usually the extreme deviate who becomes a problem. Adolescence represents an age in which variations are most marked. A study like this will eventually be of great service, not only to the medical man but to the psychiatrist and the educator—in fact, to anyone dealing with children in this age group.

ROENTGEN THERAPY: SOME OF ITS COMPLICATIONS*

By Richard T. Taylor, M.D.
Los Angeles

Discussion *by L. H. Garland, M. D., San Francisco; John D. Lawson, M. D., Sacramento; Wilbur Bailey, M. D., Los Angeles.*

IN this day of large roentgen dosages when the cry is on to more and bigger voltages, to more and more milliamperes and to more and huger roentgens, very little is said regarding the *bad* effects of increasing doses; and yet we all see them and fear them. Believing that a review of what one can see and feel in the patient undergoing treatment is a better exposition of our difficulties, especially if one uses the words of a master therapist, than a discussion of microscopic data, I beg leave to outline some points from Doctor Coutard's talk in Chicago last winter, wherein this subject received the best treatment I have ever heard.

MUCOUS MEMBRANES

If we have an individual who presents a cancer of the pharynx and we apply irradiation every day through two opposing fields, each about sixty square centimeters in size, for a dose of 4000 r in ten days, and if we examine the patient each day, we see on the irradiated mucous membrane a complete destruction of all epithelial cells, leaving the

* Read before the Radiology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

denuded dermis, which is covered immediately by a false membrane composed of fibrin and avirulent microörganisms. This reaction or radio-epithelite reaches its maximum on the thirteenth or fourteenth day and is generally repaired after five, six, or ten days, depending upon the patient. This same irradiation produces also destruction of the epithelium of the skin, but the destruction of the skin reaches its height on the twenty-sixth to the twenty-eighth day, and is generally repaired after ten to fourteen days.

If, instead of irradiating the respective tissues in ten days, the irradiation is extended over a longer period—eighteen days—one observes that the radio-epithelite occurs at the same time, that is on the thirteenth day, but with a weaker intensity, and that the same is true for the skin. If now we perform the irradiation over a still longer time—say, forty-five days—yet, using the same total dose, we see an incomplete or partial radio-epithelite appearing on the mucous membrane every thirteenth day—that is, on the thirteenth, twenty-sixth, thirty-ninth, and fifty-second days. Therefore, these periods constitute the moments of radiosensitivity of the mucous membrane or, in other words, its radiosensitivity is periodic. Coutard was the first to observe this.

If the daily dose be greatly increased, it frequently happens that the radio-epithelite is absent or occurs only partially, or that it is replaced by an intense lesion of the connective and vascular tissues, or that it occurs beyond the normal time of thirteen days; say, on the twenty-first day. Under these circumstances, the radio-epithelite is accompanied by very painful symptoms, and the membranes are thick and not thin and confluent, or they may be necrotic and repair very slowly.

CARCINOMA

Summarizing, we observe that there is an *upper* threshold, above which the radio-epithelite is delayed, painful, abnormal, incomplete, partly replaced by an intense lesion of the chorion and below which the radio-epithelite is total and normal. regarding time and intensity; a *medium* threshold above, which it is normal regarding time and intensity, and below which it is incomplete and periodic, and a *lower* threshold, below which there is no visible radio-epithelite. Since the effects of irradiation on the neoplastic epithelial cells are very similar to the effects on the normal epithelial cells, we see that between these three thresholds the roentgen therapy of cancer has to be applied. The problem is even more complex for depending on whether the mucous membranes have an epithelium, more or less, similar to the skin type—that is, with a tendency to hornification, as on the dorsal part of the tongue, the mucous membranes of the cheek and of the vocal cords, the moments of these radio-epithelites may be found anywhere between the fourteenth and the twenty-eighth days.

CONNECTIVE AND VASCULAR TISSUES

Turning now to the connective and vascular tissues, we come to the subject of edema. This is the chief, clinical reaction to irradiation in these tissues, and it may be early or delayed.

The precocious edemas appear most frequently after the first or second day of irradiation, and they indicate that the daily doses have been somewhat intense. They are usually painful and point to a certain fragility of the connective and vascular tissues. They are seen when the tissues are infected, as in infected lymph nodes. The late edemas appear two months to one year after treatment and may be superficial or deep. The superficial edemas often appear following a common cold or slight infection, and may recur periodically. They usually disappear about the end of the second year. When the edema affects the deep tissues, it generally means profound modification of the blood vessels by irradiation, and points to a daily dose or total dose that was too high or poorly spaced as regards the time factor. If the deep edema persists, it may indicate recurrence. When a persisting edema undergoes periodic regression, the probability is that there is a necrosis of the mucous membrane or cartilage, as in the delayed edema of the epiglottis, terminating in the elimination of a piece of necrotic cartilage. With the elimination of the necrotic part the tissues return to normal. The edemas which appear during the course of treatment constitute an indication which is difficult to interpret. They may be due to excessive or to insufficient doses. For example, in a radiosensitive cancer, edema may appear after the disappearance of a part of the tumor and indicate a too fragile vascular and connective tissue. In the case of a radio-resistant cancer, the edema may be due either to an excessive dose in relation to the connective and vascular tissues or to an insufficient dose in regard to the neoplasm. In the latter case increasing the dose will suffice to clear up the edema by modifying the tumor mass. If this trial is not effective, it is wise to discontinue the treatment and wait until the reaction in the mucous membrane has subsided. Coutard says that he often sees, in the course of daily uninterrupted treatments, the edema diminish during some days, then reappear and diminish again, indicating a periodic tolerance and intolerance of the connective and vascular tissues, and pointing to a faulty chronological distribution of the dose.

Among other symptoms to be classified with edema as warnings are perversion of taste and dryness of the mucous membranes, and, according to whether these three symptoms have been, more or less, marked during the treatments, one finds, eventually, more or less intense late accidents occurring years later, such as loosening of the teeth, elimination of the teeth or decalcification of the same. Successful treatment depends on keeping the connective and vascular tissues in a relatively normal state during the irradiation. Intense infection of these tissues preceding irradiation, of course, alters the outcome, as in tuberculous infection of the larynx. In treating cancer of the larynx under these conditions, the edema and mucous membrane reactions are more precocious and prolonged than in other patients, and great care must be used.

NEOPLASTIC TISSUES

The observations noted above regarding periodicity in the sensitivity of the mucous membranes, and of the vascular and connective tissues, apply also to neoplastic tissues. If one has to deal with a very embryonal, highly radiosensitive tumor, one is apt to see, as soon as the fifth or sixth day, the cancer covered with a pseudomembrane, and in these cases one expects good results with a protracted program of daily doses. If, however, these pseudomembranes do not appear before the eleventh or twelfth day, one should consider the tumor of much lower sensitivity, and in those cases where the neoplastic radio-epithelite does not appear until after the radio-epithelite of the mucous membrane as on the twenty-fifth day, one can assume a high resistance in this neoplasm. In such a case it is necessary to apply very high daily doses in order to reach the threshold of destruction of the neoplasm, but such high doses must be distributed only by series and at certain moments.

According to Coutard's experience, the time to apply these high daily doses is at the times of increased radiosensitivity of the mucous membrane and connective tissues which are, as we saw above, around the thirteenth, twenty-sixth, thirty-ninth, and fifty-second days. Treatments administered in between these periods, as for example, on the ninth to the twelfth days, the seventeenth to the twenty-second, and the thirty-first to the thirty-eighth, are apt to be followed by edemas unless the daily dose is kept low, too low, that is, to affect a highly differentiated, radio-resistant tumor. These periods can only be ignored, then, in cases of very sensitive embryonal types of tumors.

IN CONCLUSION

In conclusion, may I express my humble opinion that it will be by paying more attention to frequent examinations of the irradiated patient, by more consideration of the distribution of our doses in time in relation to sensitivity and resistance of tumors, and by keeping our fields small, our filters high, and our minute r outputs fairly low, that we will be able to minimize the complications inherent in roentgen therapy.

1212 Shatto Street.

DISCUSSION

L. H. Garland, M. D. (450 Sutter Street, San Francisco).—The complications of roentgen therapy are sometimes serious; the complications of cancer are almost always serious. Many cancers—for example, those of the skin—can be cured with almost no hazard from roentgen therapy; other cancers, such as those of the urinary bladder, can only be cured with significant potential hazard. I am in hearty agreement with some of Doctor Taylor's conclusions and with many of the excellent points which he makes in his text. However, I also wish to disagree with him in respect to some of these points.

I do not believe it has been conclusively shown that the radiosensitivity of the mucous membrane varies in a periodic or wave-like manner. Coutard's observations of marked radio-epithelitis at intervals of thirteen days in patients subjected to protracted, fractionated irradiation, have not been substantiated by other observers. This does not necessarily mean that Coutard is wrong, since the exact reproducibility of a given technique is often difficult, and since patients vary materially in their sensitivity to protracted irradiation. However, before adopting the philosophy of periodicity in the handling of well-differentiated tumors, it will be well for physicians to tread cautiously and be relatively pessimistic.

In the treatment of cancers of the tonsil, pharynx, and larynx, edema is sometimes an annoying complication, but is more often an incidental one, evident chiefly in the submental region and not involving an important portion of the pharynx or larynx. I doubt if it ever is due to "insufficient dose." I admire anyone's courage in increasing the roentgen dose in an attempt to clear up edemas which are regarded as due to an insufficient dose. I cannot regard perversion of taste or dryness of the mucous membrane as an unfavorable prognostic sign. It is almost impossible to treat adequately most squamous-cell carcinomas of the epipharynx and oropharynx, without oral dryness of at least six weeks' duration, and without perversion of taste of from one to three months' duration. The word "dryness" is used by the patient to signify scanty, thick secretion. Perversion of taste is, fortunately, of only transitory significance in most cases. However, I remember two patients who had extensive extrinsic carcinomas of the larynx which were completely arrested by external roentgen irradiation, but who were very unhappy for a period of years owing to marked perversion of taste; one of them complained that everything he ate tasted like "codfish balls."

The complications of roentgen therapy in the handling of cancer are analogous to the complications of surgical therapy. Unpleasant episodes occasionally develop, even in the best hands, and neither method can be conducted by those who are not adequately trained and reasonably experienced in their application. A knife has never cured cancer; a surgical physician has. Similarly, x-rays have never cured cancer; a radiological physician has. Extreme caution in the application of either roentgen or surgical therapy is the best method of preventing complication. Doctor Taylor is to be commended on reminding us of the great importance of using reasonably small fields and adequate filters, and of making daily examination of each and every patient to minimize those complications.

John D. Lawson, M.D. (1306 California State Life Building, Sacramento).—The physician treating malignancy by radiotherapeutic means must consider two phases of therapy: one directed against the tumor and the other toward the patient. We have accomplished no good when a tumor is eradicated, if the patient is dead as the result of too energetic therapy, or confined as an invalid for the remainder of his or her life, through overstressing the destruction of malignant tissue.

Primarily one must estimate just what procedures are necessary to properly cope with the tumor. The type of malignancy, its grade of malignancy, the histologic structure, presence or absence of infection and metastatic manifestations are of paramount importance.

Only recently a patient came into the office detailing that eight years ago a radiotherapist had given him a radium treatment for cancer of the face. Following the treatment there was an intense reaction, with loss of tissue and an area of necrosis which has persisted to date. On examination, it was found that there was a slough the size of a half-dollar in the temporal region, with a large skull defect and necrotic bone projecting into the ulcer. Growing from the meninges and the surrounding skin was a squamous cell carcinoma of a low degree of malignancy, microscopically identical with the original tumor.

In this particular case a low-grade squamous-cell tumor had been treated with intensive dosage of beta and soft gamma rays, with destruction of all tissue except that for which it was applied. Repeated doses of highly filtered radiation, over an extended time, has destroyed all of the recurrent new growth, and a plastic repair can be accomplished in a short time.

It is occurrences like this which cause us to regard every new growth as an individual problem. For the radiologist to say, "I give 1,500 roentgens in all cases of carcinoma of the lip," is absolutely wrong. Unless the patient is studied, unless the tumor is studied, and unless these two are associated and treated simultaneously in an intelligent manner, the good name of radiology will be very sadly besmirched, and cancer treatment by this means will not be accorded the place it so rightfully deserves.

Wilbur Bailey, M.D. (2007 Wilshire Boulevard, Los Angeles).—The author's paper has very properly emphasized the danger of complications, with the present trend toward progressively higher dosages of more penetrating x-rays. With the use of very high voltages in treating cancer of the cervix, for instance, the amount of radiation is limited by the reaction of the pelvic structures themselves under these conditions, rather than the skin reaction as formerly. Postradiation sigmoiditis or proctitis may prove to be complications much more serious than skin damage.

Protracted fractional radiation, as recommended by Coutard, undoubtedly has been a definite advance in radiation therapy. However, the fact that a cancer cell is most vulnerable during its actively growing phase (*i. e.*, during mitosis) still holds. In rapidly growing lymphosarcomas of the tonsil, we have found huge doses given in a few days' time not only theoretically better, but practically resulting in disappearance of lesions which had failed to respond satisfactorily to protracted fractional radiation. Conversely, very slow-growing cancers, such as thyroid metastases in bone, may respond most favorably if treatment is given in short periods every few months over a period of a year or more. Under these conditions the blood supply of the tumor is markedly decreased and its growth is checked, because of the vascular sclerosis caused by repeated doses of radiation.

LOS ANGELES COUNTY HOSPITAL COLLECTION BUREAU*

HOW LOS ANGELES COUNTY CHARGES THE INDIGENT SICK FOR HOSPITALIZATION, WHILE ACCEPTING GRATUITOUS MEDICAL SERVICE TO THE VALUE OF ABOUT TWO MILLION DOLLARS ANNUALLY, FROM ATTENDING PHYSICIANS AND SURGEONS

By George H. Kress, M.D.
Los Angeles

Foreword.—The following exhibits merely scratch the surface of matters discussed and the principles involved. They are given place in this issue to substantiate and amplify the editorial comments on page 73. As there stated, it is of greatest importance to both the citizenry of Los Angeles and California, and the medical profession of the State, that a full investigation of the billing and collection procedures of Los Angeles County be made, to the end that any methods not having warrant in California law, or that indicate a leading to deplorable results, to either public or profession, be carefully reconsidered, that needed changes may be made. It would seem that an impartial investigation, apparently much needed in the premises, might well be made by the Grand Jury of Los Angeles County, which body has both legal authority, and the financial and other means to institute a thorough study of the situation. In the past, each year's Grand Jury has made a report on the county's charitable institutions. Since the last Grand Jury was in session, new problems, as herein outlined, have arisen, and, because of the wide and serious ramifications involved in these more recent methods, a painstaking and intensive survey may well be in order.

The correspondence and other data submitted explain themselves, and, when placed together, should make clear the reasons for such editorial comments as appear in this issue of the Journal. Brief explanatory comments are made in the Exhibits, which follow, these being appended as author's "Comments," each keyed by number into the text. For convenience in perusal, some italics, paragraphs, and florets have been inserted in part of the correspondence. Comment items, with brackets, are by the contributor of this paper.

* This paper was contributed by Dr. George H. Kress, Los Angeles, who has been a member of the attending staff of the Los Angeles County Hospital and of the medical board of its attending staff for more than twenty-five years.

EXHIBIT A

Presents:

1. A letter, dated October 22, 1937, from Dr. George H. Kress to Mr. Everett J. Gray, executive superintendent of the Los Angeles County Hospital, dealing with the new system of billing "all" patients of the Los Angeles County Hospital for hospitalization (not medical) care, and the legal and other background therefor.

2. Superintendent Gray's letter, of a month later, in reply to the above.

* * *

(1. Letter from Doctor Kress to Superintendent Gray)

"Los Angeles, October 22, 1937.

Mr. Everett Gray,
Superintendent, Los Angeles County Hospital,
1200 North State Street,
Los Angeles, California

Dear Mr. Gray:

For some time it has been in my mind to ask you to send me information concerning the amount of moneys collected by the County of Los Angeles from patients who receive medical and surgical care at the Los Angeles County Hospital. [Hospitalization, not professional care.]

It is particularly brought to my mind in the case of the boy Robert Espinoza, concerning whom I wrote today to the Collection Division of the County of Los Angeles, as per enclosed letter.†

I take it that in your own Los Angeles County Hospital office you have records that are easily accessible which show the amount of money annually received from citizens who have been in-patients at the Los Angeles County Hospital. Also the number of citizens who are annually accepted as in-patients, and who do not pay any refunder to the County of Los Angeles. . . . I know you will be glad to send to me the information.

If there are any printed or mimeographed reports that cover this matter I shall appreciate the receipt of the same, and will thank you if you can mark or call my attention to the items that pertain to the subject herein discussed.

This entire matter of refunder to the County of Los Angeles for hospitalization care in the Los Angeles County Hospital is one in which the medical profession is naturally interested. I note in the statement rendered to Mr. Antonio Espinoza that the daily rate which is charged is the sum of $4.32. Kindly write and inform me what is the per capita cost in the care of patients that was listed in the three last annual reports for Los Angeles County Hospital. In other words, does this item of $4.32 per day agree for the current year with the figures which have been previously reported by the Los Angeles County Hospital as

† To conserve space, this letter is not printed.—Editor.

the cost of the care for each patient in that institution?

Have you any additional information that you may be able to send me? It has long been in my mind to discuss this subject editorially in the OFFICIAL JOURNAL of the California Medical Association, and I do not wish to take up the matter until I have at hand as complete data on the subject as it is possible to obtain.

Thanking you for your attention and coöperation in this, and with best personal wishes.

Cordially yours,
GEORGE H. KRESS, M.D."

* * *

(2. Reply of Superintendent Gray to Editor)

"Office of the Superintendent,
Los Angeles County General Hospital
Los Angeles, November 3, 1937.

Dear Doctor Kress:

Subject: 'Hospital Costs and Collections.'

Attached report[1] is sent in compliance with your request of October 22, 1937.

Very truly yours,
EVERETT J. GRAY,
Executive Superintendent."

* * *

[1] Comment.—A better understanding of the "attached report" may be had if Item 8 of the Appellate Court opinion in the Kern County Hospital case, as given on page 108, and the informal opinion of Hartley F. Peart, general counsel of the California Medical Association, on page 109, are first read. Such perusal should indicate at once that somewhere, somehow, the Kern County Appellate Court opinion has been tremendously "stretched."

* * *

(3. Enclosure: "Attached Report")

"The Los Angeles County General Hospital
1200 North State Street, Los Angeles, California
Los Angeles, November 3, 1937.

The amount of money received[2] from citizens who have been inmates of the Los Angeles County General Hospital was, for the fiscal year 1936-1937, $319,741.10, and for the first three months of the fiscal year 1937-1938, $87,741.01. [Ed. note.—For the year, the estimated amount would be $350,964.]

* * *

[2] Comment.—In the last fiscal year ending July 1, 1937, the total "hospitalization income" of the County of Los Angeles from patients who were socially serviced before admission is stated as $319,741.10. The estimated present fiscal year income, based on the first three months, is $350,964, or a probable $31,222.90 in excess of last year. Let it be remembered, however, as stated in the succeeding paragraph of Mr. Gray's letter, that since July 1, 1937, the Social Service Department has ceased to keep records of "free" (presumably indigent?) patients. Why?

* * *

The total number of admissions, exclusive of births, for the fiscal year 1936-1937 was 60,741. Of this number, Social Service records indicate that 38,672 were accepted as "free" patients. The remainder were to pay a part or all of the cost of their care.

Since July 1, 1937, no record of the number of so-called "free" patients has been maintained by Social Service or the Hospital.

All patients[3] discharged from the Hospital since July 1, 1937, *have been billed at County cost in accordance with the requirements of the Kern County Decision,* such patients to pay all or a part of the cost of their care, *if and as they become financially able to do so.*

* * *

[3] Comment.—If we understand this term aright, it means that *every patient,* even though he be absolutely indigent, is billed for hospitalization by the County of Los Angeles! More than that, we have been told that he is made to sign papers, in which, we understand, he practically promises to pay the hospitalization charges in the future; and further, if he has any means at the time, or is liable to have in the future, this indigent citizen, who is so unfortunate as to also be sufficiently sick to need hospital care, must then give the County of Los Angeles a lien on such real or personal possessions or prospective income!

* * *

The responsibility for collection of this legal obligation is that of the Charities' Collection Division.

Social Service investigates the eligibility of patients for care in accordance with the State Public Welfare Act, county ordinances and resolutions of the Board of Supervisors,[4] but does not classify them as to "free," "part" or "full" pay.

* * *

[4] Comment.—To secure copies of the "Public Welfare Act, County Ordinances and Resolutions of the Board of Supervisors" is no easy task. In a proper investigation, these should all be brought out into the light, for study and opinion by competent authorities.

* * *

The collection of moneys for all or any part of care rests with the *Charities' Collection Division subject to legislative regulations.*[5]

* * *

[5] Comment.—What has been stated in Comment No. 4 applies also to "legislative regulations." In due time, it is to be hoped that the County of Los Angeles will be prepared to submit all such legal authority.

* * *

A copy of Board Resolution,[6] *effective July 1, 1937, is attached hereto. The rates set up in this resolution include fixed overhead,* such as depreciation on buildings and equipment, interest on bonded indebtedness, workmen's compensation and other insurance. This resolution is subject to

amendment when so indicated by the institutional cost records.

* * *

[6] Comment.—This "Board Resolution of June 29, 1937" is a very interesting addendum. It is only fair to assume that Mr. E. J. Gray, executive superintendent of the Los Angeles County Hospital, and the medical director, Dr. Phoebus Berman, as the executive heads of the Los Angeles County Hospital, must either have prepared this schedule, in whole or in part, or acquiesced therein, before its submittal and recommendation for passage, to the lay Board of Supervisors.

The ward rates to indigent in-patients of the Los Angeles County Hospital seem to be in excess of the average of those charged in private hospitals in Los Angeles, as witness: California Hospital, $4; Methodist Hospital, $3.75; Cedars of Lebanon Hospital, $4.50.

The County Hospital hospitalization rates for "Special Services" vary greatly from those of private hospitals of the city of Los Angeles. One or two examples of such astounding and excessive variations for "use of operating room" will be given under Exhibit C, on page 105.

* * *

The operating room service unit mentioned in the resolution is the basis for computation of operating room cost. It is comparable to the operating room cost of private hospitals in that *it does not include any amount for the service of the surgeon.* However, the services included and method of computation differ somewhat from those of the private institution.

The Kern County Decision[7] *requires that the charges billed to patients* be according to the type of service received and include a pro rata share of such fixed overhead as depreciation, interest and insurance.

* * *

[7] Comment.—What the "Kern County Decision *requires*" is evidently a matter of opinion. It will be interesting to learn how much of the "capital investment" (land, buildings and equipment) of the Los Angeles County Hospital was brought forward to be used in the computation of the rate schedule. And whether, for instance, in including the new seventeen million dollar acute unit of the institution, such a matter as a "call system" for which the county paid in excess of ninety thousand dollars, but which was never used and later salvaged in being sold for a few thousand dollars, is today included in hospitalization charges against the indigent and near-indigent sick of the county?

* * *

The average over-all cost [for a ward bed, per day] *for the three prior fiscal years*[8] was as follows:

Fiscal year 1934-1935	$4.08
Fiscal year 1935-1936	4.39
Fiscal year 1936-1937	4.42

* * *

[8] Comment.—The average daily charge for a ward bed in one of the private hospitals of Los Angeles that have accredited standing from the Council on Hospitals of the American Medical Association, and from the American College of Surgeons, is about four dollars. In making their charges, these private hospitals must take into account and include items such as the capital investments of their plants, taxes, and depreciation. The Los Angeles County Hospital, with a large number of buildings on a thirty-five acre tract, the Acute Unit Building alone costing seventeen million dollars to erect and equip, may have a total capital investment of, say, twenty-five million dollars, on which, if it were a private hospital, it would be mandatory to pay taxes. Query: Are the interest charges on the twenty-five million dollar capital investment, plus the taxes that would be levied thereon, included in the estimation of the $4.08, $4.09, $4.42 daily ward rates of the last three years? If not, what, then, would the true daily ward rate be? These facts must be kept in mind in comparing costs of equivalent hospitalization service of such a public hospital and private institutions.

* * *

The over-all operating cost listed in the annual reports includes such extraneous services as Ambulance and Mortuary, but does not include depreciation, interest and insurance. In billing under the Kern County Decision, extraneous services are excluded from the basic ward service charge and billed only to those patients who receive them.

Eligibility for admission is determined[9] *by Social Service.* If the patient is financially able to pay anything toward the cost of his care, the ascertainment of such financial ability and future follow-up are responsibilities of the Charities' Collection Division, which undertakes the securing of *reimbursement to the county from recipients of county aid whether the aid given was institutional or direct relief.*

Everett J. Gray,
Executive Superintendent."

* * *

[9] Comment.—The Social Service Department evidently decides who are the "no pay" (indigent) or "part pay" (near-indigent and non-indigent?) patients, to be admitted to the Los Angeles County Hospital. If such is the procedure, the Department of Charities of the county must either have written such rules or acquiesced therein.

Copies of such rules, with dates on which promulgated, and by whom drafted and recommended, are of importance to both the great body of citizenry and the thousands in the medical profession, and should be carefully examined and checked.

* * *

(Copy)

Resolution of Los Angeles County Board of Supervisors of June 29, 1937

"Resolution adopted by the Board of Supervisors, June 29, 1937, covering Schedule of Charges for Care in County Institutions:

In the case of aid granted by institutional care, the reasonable charges therefor, which shall be the measure of reimbursement to the county by indigents and their liable kindred, shall, commencing July 1, 1937, be and the same are hereby fixed as follows, to wit:

In Los Angeles County General Hospital

Ward Care	Per patient per day
Pediatrics	$4.11
Orthopedic	4.10
Ear, nose and throat	3.81
Eye	4.32
Skin and malaria	3.54
Surgical	4.15
Gynecology	4.47
Genito-urinary	3.82
Neurological surgery	4.64
Medical	3.81
Obstetrical (adults)	4.46
Obstetrical (infants)	1.00
Malignancy	3.91
Infected obstetrical	4.23
Jail	5.83
Tuberculosis	3.17
Psychopathic	6.39
Communicable disease	8.54
Neurological medical	4.39

In addition to such charges for ward care, there shall be added charges for the cost of any special services, in accordance with the following schedule:

Special Services	
Ambulance (per patient per day [trip?])	$2.50
Mortuary (per death per day)	2.91
Dental treatments (per visit per day)	1.58
Dental x-rays (per film)	.10
Surgery (per operating room service unit*)	.085
Blood for transfusion (per cubic centimeter if not donated)	.05
Orthopedic services (per operating room service unit*)	.04
Birth room (per operating room service unit*)	.12
Infected obstetrical (per operating room service unit*)	.12
X-rays (plus cost of film according to size and number used, at the following rates: Each film, 14x17 in., 66¢; 11x14 in., 44¢; 10x12 in., 34¢; 8x10 in., 22¢; 6½x8½ in., 10¢; 5x7 in., 12¢.)	
Pelvis	1.98
Skull (routine)	2.69
Skull (special)	4.82
Mandible	1.98
Mastoid	2.69
Facial	1.98
Sinus	2.69
Spine (cervical)	3.40
Spine (anterior, posterior and lateral)	1.98
Spine (multiple)	2.69
Extremity (single)	1.27
Extremity (multiple)	3.40
Shoulder	1.27
Hip	1.98
Thorax	1.27
Chest (adult)	1.27
Chest (child)	2.69
Chest (anterior, posterior and lateral)	1.98
Abdomen (plain)	1.27
Gastro-intestinal	3.40
Gall bladder	3.40
Foreign body	3.40
Kidney, ureter, bladder study	4.82
Fluoroscopies	
Gastro-intestinal with meal	3.33
Gastro-intestinal with enema	1.98
Chest	1.98
To locate foreign body	1.98
X-ray therapy (per hundred roentgen r units)	.72
Radium therapy (per milligram hour)	.04

* Explanation of operating room service unit: *The total operating room service units per operation is obtained by multiplying the actual number of minutes spent by the patient in undergoing the operation by the number of county paid persons in attendance.* The term "operating room" is not confined to surgical operations, but is a general term also applicable to orthopedic and obstetrical services."

EXHIBIT B

Presents:

1. A letter dated November 2, 1937, from Doctor Kress to the Director of the Division of Accounts and Statistics of the Los Angeles Department of Charities.

2. A letter, dated November 10, 1937, from Doctor Kress to the Director, asking for specific information on eighteen items.

3. A letter, dated December 2, 1937, from the Director, in reply to Doctor Kress's letter of November 10, 1937.

* * *

(A letter dated November 2, 1937, from Doctor Kress to the Director of the Los Angeles Department of Charities—Division of Accounts and Statistics, asking for copies of county ordinances on the subject)

* * *

"Los Angeles, November 2, 1937.
Mr. J. C. Greer, Director, Accounts and Statistics,
Department of Charities,
County of Los Angeles,
Los Angeles, California

Dear Mr. Greer:

Referring to your letter of November 1, 1937, in the case of the boy, Robert Espinoza (concerning whom my letter has been referred to you by Mr. Ickes), I note that you state 'under the laws that exist, it is impossible to cross the account off the books.'

Kindly send me copy of the laws that apply in this case, or give me the references thereto.

If the county ordinances have been printed or mimeographed, I take it that it will be possible for you to mail me a copy. I enclose a stamped reply envelope.

Thanking you for your courtesy in this,

727 West Seventh Street.

Yours very truly,

GEORGE H. KRESS, M.D."

* * *

(A letter dated November 10, 1937, to the Director of the Los Angeles Department of Charities—Division of Accounts and Statistics, asking replies to eighteen questions pertaining to the subject)

"Los Angeles, November 10, 1937.

Mr. J. C. Greer,
Director, Accounts and Collections,
County Department of Charities,
Los Angeles, California

Dear Mr. Greer:

Acknowledging your reply of November 8 to my own letter of November 2 (in answer to your own of November 1, 1937), regarding the lad, Robert Espinoza, a former patient at the Los Angeles County Hospital, whose father, Antonio Espinoza, is employed by me on part time as a laborer-gardener (see my previous letters to Superintendent Gray of the Hospital and Assistant Superintendent of Charities Sydney F. Ickes), I am writing to again call attention to the fact that the father, Antonio Espinoza, is on a tentative monthly income of, say, eighty dollars, rents a house, and clothes and feeds himself, his wife and three minor children; further, that you suggest this man pay to the County of Los Angeles the sum of one dollar per month until the sum of some thirty-two dollars or so, at a $4 plus rate per day, for his son's stay at the Los Angeles County Hospital, has been paid to the County of Los Angeles.

To date, no one has given me the information I requested concerning the rules of the County of Los Angeles that determine the dividing line between total or part-pay patients, on the one hand, and no-pay patients on the other.

These new rules of the County of Los Angeles, regarding supposedly indigent patients at the Los Angeles County Hospital, are of much interest to the medical profession, especially since the members of the Attending Medical and Surgical Staff of the institution give gratuitous professional services that annually represent a donation having a money value in excess of one million dollars.

It is our purpose to discuss this subject editorially when the time seems proper, and to that end I would appreciate further information thereon. Attached you will find some suggestive questions on which further knowledge is desired.

I shall appreciate your department giving me such information as comes within its province, but am sending copies also to Mr. Rex Thompson, Superintendent of Charities; Mr. Sydney Ickes, Assistant Superintendent, and Mr. Everett Gray, Superintendent of the Los Angeles County Hospital. A copy also goes forward to Supervisor Leland Ford, because the lad, Robert Espinoza, lives in Mr. Ford's supervisorial district.

Looking forward to replies from the county departments having responsibilities in the matter under discussion, I am

727 West Seventh Street.

Very truly,

GEORGE H. KRESS, M.D.,
Editor."

* * *

(Reply, dated December 2, 1937, of the Los Angeles Department of Charities—Division of Accounts and Statistics, to the letter of November 10, 1937, asking for specific information on matters under discussion)

(Copy)

"County of Los Angeles,
Department of Charities
Los Angeles, California

Bureau of Indigent Relief:
Los Angeles County General Hospital;
Olive View Sanatorium;
Rancho Los Amigos [County Farm]

Los Angeles, December 2, 1937.

Dear Doctor Kress:

This will reply to your letter of November 10, requesting information relative to the collection program of the Department of Charities. I am very glad to have the opportunity to clarify the policies and procedures of this department with respect to collection of indigent accounts, and will endeavor to answer your questions in sufficient detail to enable you to present a comprehensive picture of our program to your associates on the attending staff of the Los Angeles County General Hospital.

Permit me to point out that *patients who have received care at the hospital are billed only for the actual cost to the county of providing hospitalization. Services of the attending staff being gratuitous,* the bills do not represent a charge for such medical attendance as is rendered by the attending physician.

Your specific questions relative to the subject of collections are answered seriatim:

1. Question.—Whether every patient who comes into that hospital is sent a bill, either to himself when he is discharged as a living patient or to his estate in case of death?

Answer.—The hospital business office prepares a bill for every in-patient [10] of the Los Angeles County General Hospital (except patients of the contagious diseases and jail wards), and forwards same to Collection Division. This division accumulates any other charges for services rendered by the Department of Charities and forwards the bill to the client or responsible relative. A bill is not sent to the client, however, during such time as he is the recipient of public charity, it

being obvious that he would have no ability to reimburse.

* * *

[10] Comment.—This statement implies that even the proven indigents are billed for "hospitalization." The last portion of Answer 1 is not clear. If the patient is not an indigent, by what legal right does he become the "recipient of public charity"; that is, become the recipient of public moneys? Granted, however, that he is "such a recipient of public charity," and has means to reimburse the county, why should not a statement for hospitalization services be rendered to him in the same manner as bills are submitted to patients in private hospitals, namely, while he is still in the hospital, with payments in advance?

And on what basis was it construed that it is "obvious that he [the patient] would have no ability to reimburse"?

* * *

2. Question.—Where do these papers accumulate, and in whose charge?

Answer.—All bills for services rendered by any unit of the Department of Charities accumulate in the Collection Division.

3. Question.—Who is the chief of the department; who are deputies in the said department?

Answer.—The Collection Division is in charge of the undersigned, responsible to the Superintendent of Charities.

4. Question.—Who has the final decision on stating whether some accounts shall be nullified, and if they can be nullified, what are the State and county ordinances that permit nullification, and in whom is the authority for nullification vested?

Answer.—Sections 2603 and 2576 of the Welfare and Institutions Code reads as follows:

"2603. If a person for the support of whom public moneys have been expended acquires property, the county shall have a claim against him to the amount of a reasonable charge for moneys so expended and such claim shall be enforced by action against him by the district attorney of the county on request of the board of supervisors. . . ."

"2576. The board of supervisors shall, in the case of aid granted by institutional care, fix a reasonable charge therefor, which shall be the measure of reimbursement to the county, and the existence of the order fixing the charge shall constitute *prima facie* evidence of its reasonableness."

Under the above sections a recipient of county aid is liable for reimbursement at any time he becomes possessed of property.[11] There is no authority for the 'nullification of charges.' In certain instances, the Board of Supervisors has adjusted claims against a recipient of aid, accepting in full payment a lesser amount than the total charges.

* * *

[11] Comment.—In view of an action under consideration by the California Supreme Court as announced in the press on January 5, 1938, and others reasons, the question of the constitutionality of certain Welfare Code provisions comes up for consideration. See Exhibit H, on page 112, for the news item concerning the Supreme Court decision.

* * *

5. Question.—What was the date under which this new ordinance or law went into effect, so far as passage by the Board of Supervisors was concerned?

Answer.—The provisions of law authorizing the county to collect reimbursement for aid to indigents are not new, first appearing in the Statutes of 1901 in substantially the same form as the above quoted sections.[12] The responsibility for collection of such claims against indigent clients of the county is placed upon the Superintendent of Charities by Rule 6N, Section 4, of the County Rules Ordinance 929 NS, which also has been in effect for many years. The only recent enactment by the Board of Supervisors relative to reimbursement was the resolution of June 29, 1937, adopting a new schedule of charges for institutional care, whereby the hospital charges were made to conform, in so far as possible, to the actual cost to the county of providing care.

* * *

[12] Comment.—If the laws governing collections were enacted in the year 1901, and, as is here stated, first applied in their present form on July 1, 1937, who were the county officers who were to blame for negligence during these thirty-six years? And who are the present county officials who made the discovery for the institution of the new system, and what were the recommendations made to the Board of Supervisors for adoption through county resolutions or ordinances?

* * *

6. Question.—When did the bureau or division that has charge of the enforcement of the ordinance become operative?

Answer.—As previously stated, the Superintendent of Charities is responsible for securing reimbursement to the county. The Collection Division of the Department of Charities, as it exists today, was created May 20, 1935. Prior to that time collections for the Department of Charities were handled by the Property Section.

7. Question.—What did they do with the accounts of all the patients who were in prior to the ordinance becoming operative?

Answer.—Following the adoption of the revised schedule of charges, a policy of billing all institutional patients at the time of discharge was placed in effect by this department. Prior to July 1, 1937, billing was restricted to those hospital patients for whom bills were recommended by the Hospital Social Service Department. It was felt[13] that it would be more equitable to bill all patients and then arrange payments in accordance with financial ability, rather than bill only a restricted group selected on the basis of immediate financial ability. Under the new system, the client is made aware of his obligation, even though there is no immediate prospect of payment.

* * *

[13] Comment.—Who were the county officials who had this "feeling," and who gave them the legal advice to proceed as here indicated? And

what is the purpose of an elaborate system of bookkeeping, to carry accounts, which are known in advance to be of no value? This same practice was rather caustically criticized not so long ago in the report of a survey instituted by the county's Bureau of Efficiency, in connection with the out-patient service of the Los Angeles County Hospital.

* * *

8. Question.—Has every patient since the ordinance became operative, without exception, either in person or through his estate, been the recipient of a notice to pay up?

Answer.—Since July 1, 1937, every in-patient has been billed, with the exceptions noted in '(1)' above.

9. Question.—What is the total amount of money that has been received in cash since the Bureau of Collection became operative?

Answer.—In the fiscal year 1936-1937, the Collection Division of the Department of Charities secured county reimbursement totaling $581,-299.23, of which $306,974.02[14] was on Los Angeles County General Hospital accounts.

* * *

[14] Comment.—According to this item, the County of Los Angeles, in the fiscal year July 1, 1936-July 1, 1937, was reimbursed by patients to the amount of $306,974.02. The five hundred members of the attending staff of physicians and surgeons who gave professional services, which have been estimated to have a money value of some two millions of dollars, received not one penny for their services! And, unbelievable as it may seem, up to the present time, in spite of repeated efforts, the attending staff has been unable to even secure an annual printed report of its professional work! Physicians are, indeed, strange mortals as regards the extent to which they carry their altruism (not only to the indigent and near-indigent sick, but to the taxpayers at large).

* * *

10.—Question.—What is the total amount of money that is scheduled in pledges?

Answer.—In this question it is uncertain what was meant by the word 'pledges.' Practically all patients of Los Angeles County General Hospital sign an agreement to reimburse the county for the cost of providing care. If the applicant is possessed of property of an assessed valuation in excess of $250, he is required to give a lien thereon as a condition of receiving aid (Rule 6h, Section 4, County Rules Ordinance 929 NS). In this fiscal year [beginning July 1, 1937] to November 1, 1937, bills were prepared by the hospital business office in the total amount of $1,169,921.87. [Ed. note.—A period of four months. On this basis, the total of bills sent out for 'hospitalization' only, to cover the entire year, would be $3,509,765.61!]

11. Question.—What is the maintenance cost of perpetuating this bureau that sends out all these notices?

Answer.—The cost of actual collection effort for the fiscal year 1936-1937 totaled $109,383.09,[15] or 18.7 cents on the dollar collected. The method of computing this figure was the same as that used by the Grand Jury investigators, who reported a cost of approximately 27 cents on the dollar for the fiscal year 1935-1936. You will note that the cost of collections has been sharply reduced in the last fiscal year.

* * *

[15] Comment.—If hospitalization statements to the amount of $3,509,765.61 will be sent out to County Hospital patients for the present fiscal year, and if again, as during last year, the sum of only $306,974.02 is collected, it would appear that about 90 per cent of the statements might be termed "bureaucratic bookkeeping"! And for what purpose? Would such a system be carried on in business circles? (A letter, dated January 24, 1938, received as this copy was in the hands of the printer, stated: "For the period July 1 to December 31, 1937, the amount representing the sum of all bills which have been sent to this division from the General Hospital represents $2,366,779.30. This represents 32,469 bills referred to us by the Los Angeles County General Hospital." The above was for the first six months. For the entire year, on that basis, $4,733,588.60 would represent the total amount of bills sent out!)

* * *

12. Question.—What is the pro rata maintenance cost of any other county departments that do part of the work of notification or of collection from these supposedly indigent patients?

Answer.—No figures are available on the cost to the institutions of preparing bills, this work being an integral part of the respective business offices.

13. Question.—What are the numbers of the ordinances, the dates on which passed, and the exact text of the ordinances that apply to this work?

Answer.—As previously cited: Sections 2603 and 2576 of the Welfare and Institutions Code.

14. Question.—What are the numbers of the ordinances; the dates on which passed; and the exact text of the ordinances that apply to this work?

Answer.—Rule 6, Section 4, County Rules Ordinance 929 NS (adopted October 1, 1923, and frequently amended), prescribes certain eligibility requirements for county aid, including the lien provision and the section making it mandatory upon the Superintendent of Charities to attempt collections.[16]

* * *

[16] Comment.—As previously stated, and especially in view of the recent California Supreme Court action, the question of instituting a test case to determine the constitutional points involved might well become a matter quite worthy of consideration.

The "frequently amended" rule concerning "eligibility requirements for county aid, including the

lien provision," should be carefully studied, from both the legal and social welfare standpoints.

* * *

15. Question.—What other counties and states have this?

Answer.—Unknown.

16. Question.—By whom were these proposed ordinances submitted to the Board of Supervisors, and through what committee of the Board of Supervisors were they presented to the entire Board for enactment?

Answer.—Probably[17] these orders were prepared by County Counsel at the express request of the Board.

* * *

[17] Comment.—The word "probably" seems out of place. It seems curious that the director of a county department division, which department sends out statements each year to the amount of $3,509,765.61, should not have, in the records of his office, the memoranda showing the official actions of the county's Board of Supervisors upon which the legal authority for his procedures must be based!

* * *

17. Question.—What portions of the Kern County Hospital Appellate Court Opinion is being used by the County Hospital as a basis for charging practically all patients a per day residence rate?

Answer.—The basis for claiming reimbursement from a county client is found in the previously cited section of the Welfare and Institutions Code; *not* in the Kern County decision.[18] The Kern County decision was taken into account, however, when the Board of Supervisors was requested to adopt a new schedule of charges for hospital care, based on a cost accounting system, to supersede the old flat charge rate of $4.00 per day. On this subject the Court expressed the following views:

"The defendants estimated the cost of hospitalization in the County Hospital at three dollars per day per patient. In arriving at this figure, no account was taken of a capital investment of several hundred thousand dollars, nor of depreciation. The amount of daily cost was reached by taking the total number at the Hospital, which included the dependent aged, as the divisor, and the total spent for the operation of the Hospital as the dividend, and dividing the result thus obtained by the number of days in the year. It is obvious that the daily cost of caring for an aged poor person who does not require hospitalization would not be as great as that of a strictly hospital patient. It is also obvious that the average daily cost of care and treatment of a patient hospitalized for a simple illness would not be as great as that of a strictly hospital patient. It is also obvious that the average daily cost of care and treatment of a patient hospitalized for a simple illness would not be as great as that of a serious operative case. The method used in reaching the daily cost per patient was so inaccurate and unbusinesslike that the result could not reflect the true daily cost to the county of any one patient. This must have resulted in gifts of county money to at least those patients who paid nothing and to those who paid only three dollars per day and who were serious operative cases."

* * *

[18] Comment.—See also Comment No. 7, previously considered, in re: Kern County Hospital opinion. It is suggested that a careful study of the Kern County Appellate Court decision be made by competent legal advisors of the county, and written opinions recorded, before bureau or other chiefs be given authority to make interpretations thereon that may be in error.

* * *

18. Question.—Any other pertinent information on the subject?

Answer.—Therefore, to conform with latest legal precedent on subject, the Department of Charities initiated the policy of billing clients on the basis of the actual cost of services rendered. The ultimate amount paid by the client is determined by his future resources, if any, and payments are adjusted according to financial ability. As the so-called Kern County decision runs counter to the acceptance of full-pay patients[19] by the county hospitals (with certain exceptions) this department has attempted to reconcile the views of the court to the provisions of law regarding reimbursement in a manner permitting the practical appliance without running contrary to legal interpretation.

* * *

I trust that the answers to your questions are sufficiently clear, and will be glad to give you any further information on the subject that you may desire.

Yours very truly,

Rex Thomson,
Superintendent of Charities.

By J. C. Greer,
Director, Accounts and Statistics.

* * *

[19] Comment.—The phraseology of this sentence leaves one in doubt as to whether this new system of collection was instituted independently, or with the written consent of the county's legal department.

Equally strange is the reference to "full pay patients." Up to now, it has been generally thought that the county hospitals of California were intended, by constitutional and legislative provisions, to provide hospitalization and medical care only for indigent or near-indigent persons who were sick or injured. As we read it, the Appellate Court decision in the Kern County Hospital case would so indicate. This view is also confirmed by the informal opinion, written on short notice, by Mr. Hartley Peart, general counsel of the California Medical Association. (See Exhibits D and E for these, pages 108 and 109.)

Occasionally, it has been stated that county employees not suffering from emergency illnesses or injuries have received treatment. If such cases are on record, investigation should be made to determine whether statements were sent to such patients, and also whether reimbursement was made. Another item for investigation would be amount of reimbursement made by insurance carriers for care to industrially injured citizens (Industrial Act of California).

EXHIBIT C

Presents:

1. The "form letter" which is sent to every inpatient after his dismissal from the Los Angeles County Hospital.

2. "Sample" of an actual statement rendered to a patient on the obstetrical service.

"County of Los Angeles
Department of Charities
Los Angeles, California

September 27, 1937.

Address reply to: Collection Division, Room 210, 434 S. San Pedro Street.
Re: ————
File No.————
Mr. ————
———— Street
Los Angeles, California
Dear Mr. ————

The account for aid advanced by the Department of Charities—County of Los Angeles, as shown above, has been referred to this office for collection.[20]

Remittance for the full amount should be made by return mail. If this is not possible because of financial conditions, *it will be necessary for you to call at this office on or before* (date) to arrange a definite plan of settlement consistent with your ability to pay.

Remittances are to be made payable to Department of Charities—County of Los Angeles, and mailed to this office. Kindly keep us informed of any change of address.

Your prompt attention is anticipated.

Yours very truly,
DEPARTMENT OF CHARITIES
Collection Division
By ————

Notice: Please bring or return this letter with remittance. All aid advanced by the Department of Charities is collectible from the party receiving such aid, or from legally responsible relatives, as provided by State Law and County Ordinance. If care is given in any County Institutions, collection at the full legal rate established by the Board of Supervisors is at all times enforceable."

* * *

[20] Comment.—Attention is called to the language used in this letter, in which reimbursement to the County of Los Angeles is practically demanded of indigent and near-indigent patients, no mention being made of the fact that attending physicians have given the medical and surgical services without cost to patients or taxpayers. As a matter of fact, to the untutored, and to those who are not such, the phrase, "aid advanced by the Department of Charities," would seem to imply not only hospitalization (board, ward bed and nursing), but also professional services! Probably nine out of ten of the unfortunate citizens receiving such statements so construe the meaning of the letter. It is not difficult to imagine the consternation which must many times come to a poor wage earner, or indigent citizen, on receiving, of a sudden, such a letter, with the statement of his indebtedness for a large sum, to cover the cost of board, room and nursing given by the County of Los Angeles, which, in many cases, the patient and relatives thought were being supplied without cost.

Oct. 9, 1937	X-ray of chest	1.93	$215.41

* * *

[21] Comment.—The item in the statement sent to this particular patient for the use of the operating room and the services of its nursing personnel (for that is what is meant by the euphonious and misleading words, "Operative—Cesarean Section.....$136.80") is little less than appalling! For comparison, in the California Hospital, of Los Angeles, the use of the operating room for a cesarean section would be $10, and at the Cedars of Lebanon Hospital, $12.50. But the County of Los Angeles charged this supposedly indigent patient, for the same hospitalization not one whit better, the extraordinary sum of $136.80! Because of such extortionate charges, included in statements sent out by the County of Los Angeles, complaints are beginning to come in from all parts of the county—to the Public Health Committee of the Los Angeles Chamber of Commerce, to physicians and others. If a circular letter were to be sent to all patients who have been billed in the last six months, some most astounding and heart-rending revelations would, no doubt, be forth-

coming! Will such an investigation be made by the constituted public authorities who have responsibility in this?

The charge of $136.80 was evidently based on the illuminating footnote, "Explanation of Operating Room Service Unit," attached to Superintendent Gray's fee table, as given in Exhibit A, on page 100, with estimate *charges of so much per minute!* It will be interesting to learn what party or parties will now assume the responsibility for having promulgated the aforesaid fee table of hospitalization charges.

In the above excerpts from the statement under discussion, the words "Operative—Cesarean Section" certainly indicate "professional service" rather than "hospitalization." If such be the case, is not then a statement so rendered an example of frank misrepresentation? And if so, should such a practice be countenanced or continued?

EXHIBIT D

Presents:

1. The full opinion of the California Appellate Court (Fourth District) handed down on January 30, 1936, and presumably used as a partial or complete justification for the institution of a new system for securing reimbursement for hospitalization services from former county hospital patients. The court's rulings are practically all included under Item 8 of the opinion, and a careful perusal of that item is suggested, especially since its substance is referred to in several of the exhibits here presented. (See page 108 for Item 8.)

* * *

PUBLIC HOSPITALS IN CALIFORNIA CANNOT HOSPITALIZE NON-INDIGENT PATIENTS*

OPINION OF THE APPELLATE COURT (FOURTH DISTRICT) AFFIRMING DECREE OF INJUNCTION RENDERED BY SUPERIOR COURT JUDGE K. VAN ZANTE

Because of its medical and legal importance and interest to the citizens and medical profession of the State of California, the opinion of the Appellate Court rendered on January 30, 1936, affirming, as modified, the decree of judgment rendered on December 4, 1933, in the Superior Court of Kern County, California, by Judge K. Van Zante is reprinted. Since this decision was handed down on January 30, 1936, it has been frequently referred to, especially in connection with county hospitals in California, whose administrators were extending the scope of such public institutions, into fields beyond their original scope.

The Appellate Court opinion follows.

* * *

Civil No. 1761. Fourth Appellate District

January 30, 1936

O. P. Goodall, T. M. McNamara, P. J. Cuneo, S. C. Long, H. N. Brown, F. J. Gundry, C. S. Compton, W. H. Moore, L. H. Fox, and L. C. McLain, Plaintiffs and Respondents, vs. Perry Brite, Stanley Abel, W. R. Woollomes, J. O. Hart, and Charles W. Wimmer, individually and as members of the Board of Supervisors of Kern County, and Kern County, a legal subdivision of the State of California, Defendants and Appellants.

[1] *Constitutional Law—Public Money—Gifts.*—Section 31 of Article IV of the Constitution prohibits cities and counties from making any gifts of public funds and from using public funds for private purposes, and the legislature cannot authorize the use of county funds for any such purpose.

[2] *Id.—Counties—Hospitals.*—While the board of supervisors of a county has the general power to adopt rules and regulations for the operation of a county hospital, that power must be exercised within the limits of their constitutional powers.

[3] *Id.—Public Health—Police Power.*—The promotion of the public health and general welfare of the citizens of a county falls within the powers granted to counties by Section 11 of Article XI of the Constitution.

[4] *Id.—Counties—Hospitals—Public Health—Police Power—Public Money—Gifts.*—The admission and treatment of patients in a county hospital who, either themselves or through legally responsible relatives, can provide themselves with equally efficient care and treatment in private institutions in the county does not promote the health and general welfare of the citizens of the county and is not a proper exercise of the police power of that county, but results in the use of public money for private purposes in violation of Section 31 of Article IV of the Constitution.

[5] *Id.—Indigents—Hospitals—Public Health—Police Power.*—A patient in need of hospitalization, who cannot himself, or through legally liable relatives, pay the charges of a private institution, but who can pay something toward his care and treatment in the county hospital, should be admitted to the county hospital because the care of such sick and injured promotes the public health and general welfare of the community in which he lives.

[6] *Id.—Counties—Hospitals—Statutory Construction.*—In this action to enjoin defendant board of supervisors from admitting certain classes of patients to the county hospital, there was no merit in the contention that as the legislature has provided that certain classes of patients in the county hospitals may pay for their care, under the maxim, "Expressio unis est exclusio alterius," the members of no other class who can contribute to their care can be admitted, and that as it is provided that those belonging to certain classes shall be admitted, no others can be received.

[7] *Id.—Hospitals—Emergency.*—In such action, the injunction issued by the trial court should have provided that in cases of accident or sudden illness, or of public disaster, such as fire, earthquake, floods, storms or epidemics, people injured or rendered suddenly ill, and for whom immediate hospitalization is made necessary, should be admitted promptly; but in such cases investigation should be made of their abilities to pay for the services rendered, and the Board of Supervisors should not hesitate to collect the full cost of hospitalization from those able to pay, and from others not able to pay in full, a fair amount, to be determined after an investigation of their resources.

[8] *Id.—Injunction—Statutes.*—In such action, the injunction issued by the trial court was not sufficiently elastic, in that it failed to provide for any contingency arising from changes in state legislation relating to the classes to be admitted and the conditions of admissions to county hospitals.

Appeal by defendants from a judgment of the Superior Court of Kern County, K. Van Zante, Judge, in an action for an injunction. Affirmed as modified.

For Appellants—Thomas Scott, District Attorney; W. A. McGinn, Assistant District Attorney; Borton & Petrini, Special Counsel.

Amici Curiæ for Appellants — Nutter & Rutherford, Stephen Dietrich.

For Respondents—Siemon, Claflin & Maas; Hartley F. Peart; Finlayson, Bennett & Morrow.

Amici Curiæ for Respondents—Elvon Musick, Howard Burrell, E. Perry Churchill.

* * *

*The plaintiffs are citizens and taxpayers of the County of Kern. The individual defendants are the members of the Board of Supervisors of the county.**

Kern County maintains a hospital for the hospitalization of the sick and injured as well as for the care of the indigent poor and indigent aged of the county. The hospital is a well-equipped institution. With the tacit, if not the express, consent of the supervisors, it is the practice to admit as patients persons well able to pay for hospitalization in private institutions, either themselves or through relatives legally liable for their support and, also, persons who can pay only part of the cost of their hospitalization in the county institution and who obviously cannot pay the higher costs of private hospitalization. *The plaintiffs challenged the right of defendants to use county funds to provide hospital care for these two classes of patients except in certain instances where such practice is permitted by statute.*

It is freely conceded by counsel for defendants that they have provided hospitalization in the county hospital for these two classes of patients and that they will continue to do so if not enjoined by order of court. It is also ad-

* This caption and its subhead, with introductory paragraph, are reprinted from CALIFORNIA AND WESTERN MEDICINE, March, 1936, on page 189.

* Editor's Note.—Italics our own.

mitted that in the past both these classes of patients have been asked to make "donations" toward the cost of their hospitalization; that no charges have been made against them and that no effort has been made to collect from any of them where the donations had not been made. It is also apparent from the evidence that some citizens of Kern County who were financially able to pay for hospitalization and treatment in private institutions had been hospitalized for considerable periods of time in the county hospital without making any payments therefor. The trial court, on ample evidence, found there were sufficient private hospitals in Kern County to satisfactorily care for all cases hospitalized in the county hospital where the patients, or relatives legally liable for their support, could have paid for private hospitalization. Therefore, we do not have presented here any question of the right of a county hospital to receive a patient possessing substantial means where there was no other hospital within a reasonable distance which could afford him proper care and treatment.

Boards of supervisors are given the express power to establish and maintain county hospitals and to provide rules for their government and management. (Sec. 4223, Political Code.) A like power is given them to establish and maintain almshouses and county farms. (Sec. 4224, Political Code.) In Kern County the poor are cared for at the county hospital. Therefore, it is a combination county hospital and almshouse.

Defendants maintain that as the Board of Supervisors of Kern County is given the power to "establish" and "maintain" a county hospital and provide rules for its "government" and "management," the question of who shall be admitted and upon what terms is within the sound discretion of the board and cannot be controlled by injunction. They also urge that Section 11 of Article XI of the Constitution vests in counties police powers which are as broad as those possessed by the state, except where prohibited by statute. From this they argue that as the promotion of the health of the residents of Kern County, as well as the promotion of their general welfare, is one of the principal police powers given under this section they may admit to the hospital any resident of Kern County possessing the necessary qualifications of residence regardless of his ability to pay and without making any charge against him.

We will first consider these questions from the point of view of the admission to the hospital of those patients who either themselves, or through legally liable relatives, are able to secure and pay for hospitalization and treatment in private institutions.

Section 31 of Article IV of the Constitution "took from the legislature the power to give, lend, or authorize the giving or lending of the state's credit, or that of any county, city and county, city or township, or other political corporation or subdivision of the state, in aid of or to any person, association, or corporation, municipal or otherwise, or to pledge the credit thereof in any manner whatever, for the payment of the liabilities of any individual, association, municipal or other corporation, whatever; or to make or authorize the making of any gift of any public money or thing of value to any individual, municipal or other corporation whatever.

"These limitations divested the legislature of all power to make appropriations of money to any private or quasi-public corporation or to make any gift to any municipal or public corporation not under the exclusive control and management of the state. It also deprived the legislature of the power to authorize counties to make donations or gifts or pledges of credit to such associations. *The Constitution does not give to any department of the state government any power whatever to engage in private business or enterprise, or to manage and control private corporations or quasi-public corporations for private profit, although such corporations may be carrying on enterprises or performing functions which are for general public benefit and which tend to promote the general welfare. Our state government has no such powers." (People* vs. *San Joaquin Valley etc. Assn.*, 151 Cal. 797.)

[1] *It has been held that this same section of the Constitution prohibits cities and counties from making any gifts of public funds and of using public funds for private purposes. (Pacific Mutual Life Ins. Co.* vs. *County of San Diego*, 112 Cal. 314; *City of Oakland* vs. *Garrison*, 194 Cal. 298; *Chapman* vs. *City of Fullerton*, 90 Cal. App. 463.) The legislature cannot authorize the use of county funds for any such purposes. (*Conlin* vs. *Board of Supervisors*, 99 Cal. 17; *Conlin* vs. *Board of Supervisors*, 114 Cal. 404; *Johnston* vs. *County of Sacramento*, 137 Cal. 204.)

[2] *It must be conceded that while the board of supervisors has the general power to adopt rules and regulations for the operation of the Kern County hospital, that power must be exercised within the limits of their constitutional powers. It must be further conceded that if their acceptance for hospitalization of patients who, themselves, or through legally liable relatives can provide efficient hospitalization elsewhere, amounts to a gift of public funds to private persons which is prohibited by Section 31 of Article IV of the Constitution, its continuance may be enjoined by the courts.*

In discussing the extent of the grant of police powers to municipalities by Section 11 of Article IV of the Constitution the Supreme Court in the case of *Miller* vs. *Board of Public Works*, 195 Cal. 477, said: "The police power of a state is an indispensable prerogative of sovereignty and one that is not to be lightly limited. Indeed, even though at times its operation may seem harsh, the imperative necessity for its existence precludes any limitation upon its exercise save that it be not unreasonably and arbitrarily invoked and applied. (*Hadacheck* vs. *Sebastian*, 239 U. S. 394, Ann. Cas. 1917B, 927, 60 L. Ed. 348, 36 Sup. Ct. Rep. 143; *District of Columbia* vs. *Brooke*, 214 U. S. 138, 149, 53 L. Ed. 941, 29 Sup. Ct. Rep. 560; see, also, Rose's U. S. Notes.) It is not, however, illimitable, and the marking and measuring of the extent of its exercise and application is determined by a consideration of the question of whether or not any invocation of that power, in any given case, and as applied to existing conditions, is reasonably necessary to promote the public health, safety, morals (*Hannibal etc. R. R. Co.* vs. *Husen*, 95 U. S. 465, 470, 471, 24 L. Ed. 527; *Boston Beer Co.* vs. *Massachusetts*, 97 U. S. 25, 24 L. Ed. 989), or general welfare of the people of a community. (*Chicago, B. & Q. Ry. Co.* vs. *Illinois*, 200 U. S. 561, 592, 4 Ann. Cas. 1175, 50 L. Ed. 596, 26 Sup. Ct. Rep. 341; see, also, Rose's U. S. Notes.) . . .

"In its inception the police power was closely concerned with the preservation of the public peace, safety, morals, and health without specific regard for 'the general welfare.' The increasing complexity of our civilization and institutions later gave rise to cases wherein the promotion of the public welfare was held by the courts to be a legitimate object for the exercise of the police power. As our civic life has developed so has the definition of 'public welfare' until it has been held to embrace regulations 'to promote the economic welfare, public convenience and general prosperity of the community.' (*Chicago, B. & Q. R. R. Co.* vs. *Illinois, supra.*) Thus, it is apparent that the police power is not a circumscribed prerogative, but is elastic and, in keeping with the growth of knowledge and the belief in the popular mind of the need for its application, capable of expansion to meet existing conditions of modern life and thereby keep pace with the social, economic, moral, and intellectual evolution of the human race. In brief, 'there is nothing known to the law that keeps more in step with human progress than does the exercise of this power.' (*Streich* vs. *Board of Education, supra*), and that power 'may be put forth in aid of what is sanctioned by usage, or held by the prevailing mortality or strong and preponderant opinion to be greatly and immediately necessary to the public welfare.' (*Noble State Bank* vs. *Haskell*, 219 U. S. 104, Ann. Cas. 1912A, 487, 32 L. R. A. [N. S.] 1062, 55 L. Ed. 112, 31 Sup. Ct. Rep. 186; see, also, Rose's U. S. Notes.)" See, also, *Coelho* vs. *Truckell*, 82 Cal. App. Dec. 639.

In *Jardine* vs. *City of Pasadena*, 199 Cal. 64, it is said: "The selection of the hospital site was a matter within the legislative discretion of the board of directors of the city, and unless in the exercise of that discretion the board acted arbitrarily and unreasonably, its action ought not to be enjoined.

" 'The location, establishment and maintenance of such an institution is clearly within the scope of the police power of the city. General police authority to protect the public health is conferred upon the city by Section 11 of Article XI of the State Constitution, which provides that "any county, city, town, or township may make and enforce within its limits all such local, police, sanitary and other regulations as are not in conflict with general laws." ' "

[3] It follows as an inescapable conclusion from what has been said in the cases from which we have quoted that the promotion of the public health and general welfare of the citizens of Kern County falls within the powers granted to the county by Section 11 of Article XI of the Constitution. *Does the hospitalization in the county hospital of those able to secure efficient hospitalization in other institutions promote the health and general welfare of the citizens of Kern County? The answer to this question will determine whether that policy falls within the protection of the provisions of Section 11, and also whether the expenditure of public funds for that purpose amounts to a use of them for a public purpose or gifts to private persons.* This last follows, because, if the use of the money for the purposes specified promotes the health or general welfare of the people of Kern County, that in itself should be held to be expenditures for a public purpose and not gifts to private persons.

[4] In approaching this question it should be borne in mind that the record establishes the fact that there are excellent privately owned hospitals in Kern County with sufficient facilities to care for those who can pay for their care and treatment. It seems, therefore, that the question is not so much the preservation of the health and general welfare of the financially able citizens of the county as it

is one of the preservation of their private resources. If a patient can be given the same and equally efficient care and treatment in a private hospital that he can receive in the county institution, his choice of a hospital does not determine his chances of recovery but merely the amount he must pay to be healed, and whether he will pay the established charge of a private institution, or nothing or the small donation hoped for by the county hospital. The preservation of the health and general welfare of the citizens of the county is a question of the prevention and cure of disease generally, and not the accomplishment of these ends by any particular means or in any particular institution. *We, therefore, conclude that the admission and treatment of patients in the county hospital who, either themselves or through legally responsible relatives, can provide themselves with equally efficient care and treatment in private institutions does not promote the health and general welfare of the citizens of Kern County and is not a proper exercise of the police power of that county and results in the use of public money for private purposes.*

We have further facts in the record bearing upon the question of the use of public money for private purposes. The defendants estimated the cost of hospitalization in the county hospital at three dollars per day per patient. In arriving at this figure no account was taken of a capital investment of several hundred thousand dollars, nor of depreciation. The amount of daily cost was reached by taking the total number at the hospital, which included the dependent aged, as the divisor, and the total spent for the operation of the hospital as the dividend, and dividing the result thus obtained by the number of days in the year. It is obvious that the daily cost of caring for an aged poor person who does not require hospitalization would not be as great as that of a strictly hospital patient. It is also obvious that the average daily cost of care and treatment of a patient hospitalized for a simple illness would not be as great as that of a serious operative case. *The method used in reaching the daily cost per patient was so inaccurate and unbusinesslike that the result could not reflect the true daily cost to the county of any one patient.* Thus must have resulted in gifts of county money to at least those patients who paid nothing and to those who paid only three dollars per day and who were serious operative cases.

[5] When we approach the question of those patients who are admitted to the county hospital and who cannot pay for hospitalization in private institutions but who can pay something toward their care and treatment, we have an entirely different situation from the one we have been considering. We must bear in mind that providing hospital facilities to those legally entitled thereto is a proper exercise of the police power of the county (*Jardine* vs. *City of Pasadena, supra*) as it tends to promote the public health and general welfare of the citizens of the county. (*Miller* vs. *Board of Public Works, supra.*) In the second phase of the case we have the problem of the care of the health and the promotion of the general welfare of what we may term the deserving needy but not the pauper class of the county. This class must be hospitalized at the county hospital or permitted to suffer without proper care. It is common knowledge that this class composes a considerable proportion of the body of the citizenship of any county. As a rule those composing it are honest, industrious, and often thrifty people whose welfare should be of first concern to any governmental agency. *It is admitted that a resident pauper must be hospitalized at public expense.* This is a matter of pure humanity and no one, solely because of poverty, should be permitted to suffer because of lack of funds. The same reasons apply with greater force to the class we are considering. We can visualize the head of a family who has employment and can keep it—an honest worker, frugal and thrifty, who supports his family, educates his children, and has perhaps acquired an equity in a modest home. If he is injured, not in the course of his employment, the family income stops and he may require hospitalization and may lack the funds with which to enter a private institution. Must it be said that he should be refused admission to the county hospital because he is not a pauper when if he were a pauper he would be admitted without question? This would amount to the penalizing of honest industry, thrift and independence, and would place a premium on indolence and shiftlessness. *Under the principles of humanitarianism, and in the interest of a sound policy, we are compelled to hold that a patient in need of hospitalization, who cannot himself, or through legally liable relatives, pay the charges of a private institution, should be admitted to the county hospital because the care of such sick or injured promotes the public health and general welfare of the community in which he lives.*

If it were necessary we could find another satisfactory reason for the admission of this class of patients to the county hospital. *It is admitted that indigent persons are to be admitted when in need of hospitalization. As far as we know the term "indigent" has not been defined in California in so far as its use in connection with admissions to county hospitals is concerned.* It has been defined in other states chiefly in connection with the admission of the indigent insane to hospitals. *The term when thus used has been held to include persons with insufficient means to pay for hospitalization after providing for those who legally claim their support. (Depue* vs. *District of Columbia,* 45 App. D. C. 54; *In re Hybart,* 119 N. C. 359, 25 S. E. 963; *Mass. Gen. Hospital* vs. *Inhabitants of Belmont,* 233 Mass. 190, 124 N. E. 21; *People* vs. *Board of Supervisors,* 121 N. Y. 345, 24 N. E. 830). *Applying this definition to the instant case, we hold that the word "indigent," when used in connection with admissions to county hospitals, includes an inhabitant of a county who possesses the required qualifications of residence, and who has insufficient means to pay for his maintenance in a private hospital after providing for those who legally claim his support.*

[6] Under the maxim, "Expressio unis est exclusio alterius," it is urged that as the legislature has provided that certain classes of patients in the county hospitals may pay for their care, the members of no other class who can contribute to their care can be admitted, and, further, that as it is provided that those belonging to certain classes shall be admitted, no others can be received.

We cannot agree with this argument. Boards of supervisors are given broad powers in providing for the establishment and maintenance of county hospitals and in prescribing rules for their government and management. (Sec. 4223, Political Code.) *The word "management" has been frequently defined when used in legal phraseology.* When used in a statute giving the husband management and control over his wife's property it has been held to mean that it gave him the power to invest her money. (*Sencerbox* vs. *First National Bank,* 14 Idaho 95, 93 Pac. 369.) When used in the title of an act relating to reform schools, it was held to include provisions in the act providing for the committing of certain juveniles to the schools. (*In re Sanders,* 53 Kan. 191, 36 Pac. 348.) See, also, *Watson* vs. *Cleveland,* 21 Conn. 538; *Commissioners of the Sinking Fund* vs. *Walker,* 7 Miss. [6 How.] 143; *In re Brennan's Will,* 251 N. Y. 39, 166 N. E. 797; *City of Topeka* vs. *Independance Ind. Co.,* 130 Kan. 650, 287 Pac. 708; *Stagway* vs. *Riker,* 84 N. J. Law 201, 86 Atl. 440. *When a board of supervisors is given management of a county hospital, that body is given the power to adopt rules for the admission of patients, provided, of course, that they must admit those entitled by law to enter and cannot admit those whose reception is prohibited by law of the Constitution.* In their rules of admission they should have the power to provide for the payment for care by those not financially able to secure hospitalization in a private institution, the amount to be paid to be determined to its maximum by the cost to the county of hospitalization of each individual patient and charged to the patient on his ability to pay. In the administration of public funds the supervisors are acting as trustees and they should so administer those funds as to lighten the taxpayers' burden as much as possible.

[7] *Another class of patients which should be admitted to county hospitals deserves our consideration.* In cases of public disaster, such as fire, earthquake, floods, storms, or epidemics, people may be injured or rendered suddenly ill and immediate hospitalization may be necessary to save life. The same is true in cases of accident or sudden illness. In such cases, delays in admissions to permit investigations of the financial conditions of the patients might cause loss of life. Such patients should be admitted promptly, investigation of their abilities to pay should follow. Ordinary humanity could dictate no other course. In such cases boards of supervisors should not hesitate to collect the full cost of hospitalization from those able to pay, and from others not able to pay in full, a fair amount, to be determined after an investigation of their resources. We have stricken clause "i" from the decree of the trial court and have added another under the same letter to provide for such cases.

* * *

[8] The decree in this case is not elastic. Over a period of years the legislature has changed and increased the classes to be admitted to county hospitals. That body may continue with such legislation and many provide for the admission of new classes, or restrict those now admitted, or place new conditions upon admissions. To take care of this contingency we have added clause "j" to the decree.

Defendants complain that the decree as rendered is uncertain in several particulars. Plaintiffs in effect admit the charge by proposing amendments to it. We have studied the decree as amended by them and have concluded that it substantially meets the objections of defendants. On our own motion we have stricken one paragraph which plaintiffs proposed to retain as we regard it as surplusage.

It is ordered that the decree of injunction rendered by the trial court on December 4, 1933, be modified by striking therefrom the words, letters and figures not appearing in the decree of injunction hereinafter set forth and adding the words, letters and figures appearing in the decree of injunction hereinafter set forth which do not appear in the said decree signed by the trial judge *so that the decree of*

injunction in this case shall read as follows: (Following the title of the court and cause.)

"The above-entitled matter having been heretofore heard and determined by the undersigned Judge of the Superior Court of the State of California, written findings of fact and conclusions of law having been heretofore duly and regularly signed and filed herein ordering judgment in favor of the above-named plaintiffs and against the above-named defendants as hereinafter given and made, and the case being in all respects ready for final judgment and decree:

"It is therefore ordered, adjudged, and decreed that the defendants Perry Brite, Stanley Abel, W. R. Woollomes, J. C. Hart, Charles W. Wimmer, individually, and as members of the Board of Supervisors of Kern County, and Kern County, a legal subdivision of the State of California, and each of them, and every officer, deputy, agent, appointee, subordinate, servant or employee of the above-named defendants, or either or any of them, and particularly and especially the officers, deputies, agents, employees, appointees, servants, doctors, superintendents, heads of departments, internes, nurses, and assistants, and all other persons acting under defendants or any of them in any matter relating to the operation, maintenance, administration, or conduct of that certain County Hospital of the County of Kern known as the Kern General Hospital, be, and each of such persons *is, and all of them are hereby forever permanently restrained, enjoined, and commanded to desist from admitting to and receiving as patients of, caring for, curing, treating, boarding, nursing, furnishing food or supplies or lodging to, or hospitalizing in, said Kern General Hospital, or at or in any out-patient clinic thereof, any person:**

Who, after due injury and investigation is not found to be an indigent person as herein defined,

or a dependent or partially dependent person in case of emergency,

or who is found, after due inquiry and investigation, to be a person who is himself, or has a relative or relatives legally liable for his support, able to pay for and obtain proper and necessary medical or surgical or hospital care or treatment or services for himself elsewhere than in the county hospital except as hereinafter specified.

The following should be admitted:

(*a*) An indigent sick or dependent poor person.

(*b*) A needy sick and dependent or partially-dependent citizen in case of emergency.

(*c*) A psychopath, narcotic addict or habitual inebriate temporarily in custody.

(*d*) A physically defective and physically handicapped person under the age of eighteen years when the parents or guardians of such person are not financially able to secure proper care or treatment and when such person's admission and treatment has been duly authorized in the manner provided by law.

(*e*) A person in the active stages of tuberculosis, in wards established for the treatment of such persons, who is able to pay for such treatment and who, when able to pay, is required to pay for such treatment.

(*f*) A person to be quarantined or isolated in the county hospital with a contagious, communicable or infectious disease.

(*g*) A prisoner confined to any city or county jail who requires medical or surgical treatment necessitating hospitalization where such treatment cannot be furnished or supplied at such jail when the Superior Court of the county shall have ordered the removal of such prisoner to the county hospital and said prisoner elects not to furnish such treatment at his own expense.

(*h*) A county employee injured in the course of his employment by the county when hospitalization is reasonably required to cure and relieve the effects of such injury.

(*i*) A person in need of immediate hospitalization on account of accident or sudden sickness or injury or by reason of sickness or injury caused by or arising in a sudden public emergency or calamity or disaster. Provided,

(*j*) Nothing in this decree shall be construed as restraining defendants from obeying or carrying out or giving effect to any law that may be passed hereafter relating to the hospitalization of patients in county hospitals which may affect the hospital in Kern County.

"It is further ordered that plaintiffs have their costs herein expended taxed at $306.62.

"Done in open court this fourth day of December, 1933.

"K. Van Zante, Judge of the Superior Court."

As so modified the judgment is affirmed. Each party will pay their own costs on appeal.

Marks, J.

We concur:
Barnard, P. J.
Jennings, J.

(A letter dated January 17, 1938, from Doctor Kress to Mr. Hartley F. Peart, General Counsel of the California Medical Association, requesting informal comment to some questions concerning the Kern County Appellate Court decision)

"Los Angeles, January 17, 1938.

Mr. Hartley Peart,
1800 Hunter Dulin Building,
111 Sutter Street, San Francisco, California

Dear Hartley:

I dislike to bother you with new queries, but, as stated at the California Medical Association Council meeting on January 15, the admission of patients to county hospitals, who are neither 'pauper indigents' nor 'medical indigents' is a matter of pressing importance.

In the March, 1936, California and Western Medicine, page 189, you will find the Appellate Court decision in the Kern County Case, and I am asking you for an informal legal opinion on certain of its provisions. . . .

Try to send me some informal notes, but promptly, because they may be of help in editorial and other comment.

Cordially yours,
George H. Kress, M.D."

* * *

(Letter dated January 19, 1938, from General Counsel Peart giving some informal opinions on questions contained in Doctor Kress's letter of January 17, 1937. Italics, etc., by the Editor)

"Re Goodall *v.* Brite—County Hospitals
San Francisco, January 19, 1938.

Dear Doctor Kress:

Upon receipt of your letter of January 17 in regard to the above case, we have reëxamined the portions of the court's opinion to which you called our attention, and have reached the following conclusions:

* * *

In regard to the determination of indigency or non-indigency, it appears to us clear, from the opinion of the District Court of Appeal in Goodall *v.* Brite, that boards of supervisors are obliged by law to determine whether or not a prospective

patient is an indigent *prior to admission* in the county hospital *unless* the case is an emergency, as defined in clause (i) of the injunction, viz.:

'A person in need of immediate hospitalization on account of accident or sudden sickness or injury or by reason of sickness or injury caused by or arising in a sudden public emergency or calamity or disaster.'

* * *

With respect to your second question, namely:

'Has a county hospital a legal right to admit an emergency patient as an indigent without first determining that point through social service investigation?'

It is my opinion that the decision in Goodall *v.* Brite conclusively determines the law to be that *boards of supervisors have no legal right to admit a non-indigent patient as an indigent without first determining the fact of indigency by 'due inquiry and investigation.'*

Whether or not due inquiry and investigation requires social service investigation is not determined by Goodall *v.* Brite, although it can be said, without hesitation, that due inquiry and investigation involves a bona fide factual inquiry by competent persons.

The reason that I have answered your inquiry in the above manner is that the injunction of the Superior Court, approved by the District Court of Appeal, specifically enjoins the supervisors of Kern County from

'Admitting to and receiving as patients of, caring for, curing or treating, boarding, nursing, furnishing food or supplies or lodging to or hospitalizing in said Kern General Hospital or at or in any out-patient clinic thereof, *any person who, after due inquiry and investigation,* is not found to be an indigent person as herein defined, or a dependent or partially independent person in case of emergency, or who is found, *after due inquiry and investigation,* to be a person who is himself, or has a relative or relatives legally liable for his support, able to pay for and obtain proper and necessary medical or surgical or hospital care. . . .'

The phrase 'after due inquiry and investigation,' which appears twice in the portion of the injunction above quoted, necessarily implies that boards of supervisors are under a duty to determine the fact of indigency or non-indigency prior to admission in the county hospital, except in those cases coming within clause (i) of the injunction, which I have previously quoted.

* * *

With respect to your next inquiry, namely:

'If a patient is entered as an indigent, by what right do they make the patient sign a note for repayment for hospitalization service later on?' it appears to me that this is a point which has not arisen in the past and, therefore, requires careful examination of all of the statutory and constitutional provisions relating to powers and duties of the several boards of supervisors.

The injunction in Goodall *v.* Brite, which was very carefully prepared and which was approved by the District Court of Appeal after a lengthy and exhaustive hearing, *leads one to believe that the District Court of Appeal assumed that persons admitted to county hospitals as indigent sick or dependent poor persons, after due inquiry and investigation had established such to be the fact, would never be called upon to pay the cost of hospitalization if they should, in the future, acquire resources, but that, on the other hand, the court definitely felt that partially indigent persons should be admitted and that such persons should be required to pay that portion of the cost of hospitalization which their available financial resources would allow.*

Of course, the *court held that persons wholly able to pay* for private hospitalization and for medical or surgical services could not, under any circumstances, be admitted to county hospitals.

* * *

It occurs to us that the situation which you mention in your inquiry could not arise if the court's decision in Goodall v. Brite is followed by the several boards of supervisors, because, if it is followed, due inquiry and investigation are made before admission. Hence, the facts are known, and only those who are partially able to pay need be required to make any payment. *If the court's decision is not followed, and no inquiry and investigation is made, the answer is, of course, that the board of supervisors must be considered to be acting in excess of its statutory authority.*

* * *

The foregoing comments are the result of a hasty reëxamination of the decision in Goodall *v.* Brite, and I am sending this to you without further research because you state in your letter that you are in a great hurry for my comment.

111 Sutter Street.

Very truly yours,

HARTLEY F. PEART."

EXHIBIT F

Presents:

1. A newspaper item of January 6, 1938, stating that the California Supreme Court had evidently found merit in the contention concerning the question, "Do county boards of supervisors have a legal right to demand liens on the property of citizens who had received county aid?"

The court's decision will be awaited with interest, because it may have an important bearing on the action of county authorities in taking liens on the property of former county hospital patients, intended to reimburse a county to cover costs of board, lodging and nursing (the usual hospitalization charges). Should not an indigent sick citizen

be as worthy of consideration as an old age pensioner, who may be in good health?

* * *

COUNTY FACES $960,000 LOSS IN LIEN CASE

State Supreme Court Rules 1937 Law Cancels Hold on Properties of Pensioners

Los Angeles County faces the prospect of losing $960,000 in liens on the property of 4,000 state-aid pensioners as a result of a ruling of the California Supreme Court yesterday.

The Supreme Court issued an alternative writ returnable on January 12 [1938] when Roger Jessup, chairman of the Board of Supervisors, must show cause why he should not release title to the property of eight pensioners. These pensioners accepted liens on their property in favor of the state under the 1935 law in order to obtain state aid.

Test Case

The 1937 law wiped out the necessity for such liens and was designed to cancel all former liens. The county holds 4,000 of them at a face value of $960,000. If the 1937 law is sustained, all of these must be released.

Eight recent cases of deceased pensioners were put into one suit to establish a test case, which by its action the Supreme Court agreed to hear.—*Los Angeles Examiner,* January 6, 1938.

Presents:

1. A letter dated December 23, 1937, from the Superintendent of the Los Angeles County Hospital to the Los Angeles County Auditor, in which attention is called to faulty methods of estimating hospitalization costs, in so far as the same relate to operating rooms and personnel charges.

2. A letter dated December 27, 1937, from the Superintendent of the Los Angeles County Hospital to the Director of Accounts, Budgets and Records of Los Angeles County, calling attention to faults in the system of estimating hospitalization charges, especially as regards the use of operating rooms and personnel.

* * *

(Letter from County Hospital Superintendent to the County Auditor[22]*)*

"The Los Angeles County General Hospital,
Los Angeles, California
December 23, 1937.

Mr. H. A. Payne,
County Auditor,
Room 302, Hall of Records,
County of Los Angeles
Dear Mr. Payne:

When the cost accounting survey at the hospital was undertaken by your office and figures were finally developed as a basis for the making of charges for hospital care to patients of this institution, we were instructed as follows in connection with operating room service:

'Explanation of operating room service units: The total operating room service units per operation is obtained by multiplying the actual number of minutes spent by the patient in undergoing the operation by the number of county paid persons in attendance. The term "operating room" does not apply to surgical operations but is a general term also applicable to orthopedic and obstetrical services.'

Because this hospital is a teaching institution both for internes studying medicine and surgery and for student nurses, there are frequently in attendance in operating rooms persons in excess of the number who would ordinarily be required as a minimum necessary for the performance of the operation procedures. It might be suggested that in the determining of charges that will be entered against the patient, only those persons considered essential should be included in the cost figures maintained. In attempting to accomplish this, however, I am certain we would encounter many difficulties, for our surgeries are scheduled to be in constant use and surgical crews are changing even while the patient just operated is being removed from the table and the next patient, already under anesthesia, is being brought into the operating room. Difficulties would undoubtedly arise should we attempt to have some one individual decide just who in the operating room were essential, as so frequently the assistants considered essential could be determined only by the surgeon. At the moment that such determination should be made, there is no time allowed for 'time out' to permit the designation of certain individuals who should be present, as you will appreciate the patient is even then partially anesthetized, and as soon as he is placed on the table further anesthesia is administered and the attendants immediately busy themselves with preparing the patient for the operating procedure which is to be undertaken immediately. It is of prime importance that no delay be imposed upon or allowed the surgical staff from this moment on. Considering again that 'essential assistants' are so frequently a matter of opinion of the surgeon, it may be readily realized that two identical operations would bear different costs.

The result of following the procedure as outlined has been that charges have been made to patients who have received surgery at the hospital which are ridiculous in their amounts; in fact, it is not uncommon that charges are indicated that are considerably above those that the patient would be required to pay in a private institution. This situation is bringing a great deal of criticism to the hospital and the Department of Charities, and we must agree that in many instances the criticism is entirely justified.

To correct this situation, we strongly urge that the county charge patients for operations depending upon the average cost of performing the type of operation to be undergone by the patient to be charged. These average costs are available, and, if used, would be developed in a manner similar to the development of the costs for routine ward care. For instance, we charge a patient $4.11 per day for care in the pediatric service; $4.10 per day on the orthopedic service; $3.81 on the ear, nose and throat service, and so on through the several services. The care for which these charges are made represents the average cost to the county of providing care for patients on the respective services. It is acknowledged that between two patients on the same service, one may require and receive considerably more nursing attention than the other,

yet the charge made to these two patients is the same inasmuch as the charge is based upon the average cost of care of patients generally upon the ward in question. Could we not then consider it feasible and proper to base our charges for surgery on the average cost of performing an operation of any given character? If this could be allowed, we believe that we would be making our charges on an equitable and defensible basis and we are therefore requesting that every effort be made to authorize the hospital to prepare charges for surgical procedures on the basis suggested.

We feel that it is very important that such changes be instituted as soon as possible in order that the hospital and the county will be relieved at once of the many criticisms that have arisen from the procedures now in practice, of which we do not approve.

Very truly yours,
(Signed) Everett J. Gray,
Executive Superintendent.

cc: Supt. of Charities
Mr. Sydney Ickes
Medical Director, LACH
Medical Director, LACGH
Director, Accounts,
Budgets and Records."

* * *

[22] Comment.—At the end of six months, with an increasing number of complaints being brought to their attention, the Los Angeles County Hospital authorities finally wrote to the County Auditor and County Director of Accounts. Hospital Superintendent Gray's comment, "that charges have been made to patients who have received surgery at the hospital which are ridiculous in their amounts," does not fully tell the story. The word "ridiculous," when applied to the use of an operating room and its nursing and orderly personnel (surgical operation not included) for a cesarean section operation, and for which a charge of $136.80 was made by the County of Los Angeles, with bill sent to a supposedly indigent citizen, surely warrants words and language stronger than the benign term, "ridiculous." How can this six months' delay in rectifying what, from the outset, was nothing less than a patent error, he explained? Would the letters of December 23, 1937, and December 28, 1937, have been written had there been no complaints?

* * *

(Letter from County Hospital Superintendent to County Director of Accounts)

"The Los Angeles County General Hospital
Los Angeles, California
December 27, 1937.

Director, Accounts, Budgets and Records:

Subject: 'Billing Patients for Surgical Operations.'

Will you please arrange at once to instruct those responsible for reporting the names of employees concerned with any surgical operation that to be included in the list of those employees to be charged the patient are those individuals only who are considered essential to the operation to be undertaken. This means specifically that individuals present in surgery for the purpose of instruction, even though they may be taking part in the work to be performed, are not to be charged against the patient UNLESS they are participating in a major way.

It is essential that we correct charges immediately, for I am convinced that the rates charged to patients for certain surgical operations are unreasonable and not justifiable.

I have written a letter to the County Auditor requesting his authority to charge the patients the average cost of given types of operations, but, even before any such authorization which may be undertaken, I am directing you on my own responsibility to follow the above instructions having to do with the elimination from the list of persons whose time is to be charged patients those who are not essential to the operation.

Everett J. Gray,
Executive Superintendent.

cc: Supt. of Charities
Med. Dir., LACH
Med. Dir., LACGH."

EXHIBIT H

Presents:

A recent newspaper item of January 10, 1938, in which are given the total amounts received from former county hospital patients. Whoever gave this "publicity" to the press erred in using the words "medical care," when only room, board and nursing (hospitalization charges) could rightfully be included. The query arises as to the number of taxpayers who would be proud of sums so received by the County of Los Angeles from its indigent citizens if they knew the real story as outlined in skeleton form in these comments.

* * *

$343,489 County Hospital Fees

Reimbursements made by former patients at the General Hospital during 1937 totaled $343,498, it was announced yesterday by Rex Thomson, County Superintendent of Charities.

A record high for one month was reached last month, when former patients paid in $33,561, the report disclosed.

State laws governing county hospitals provide that each patient treated at the hospital be sent a statement of the exact cost of the medical care administered. The patient is required to pay the hospital when financially able.

County hospitals cannot accept for medical care any person able to pay for such care at a private hospital, unless an emergency exists, according to the statute, Thomson said.—*Los Angeles Times,* January 10, 1938.

EXHIBIT I

Presents:

1. A somewhat pertinent item from a San Luis Obispo County newspaper of December 16, 1937, on an action taken by the attending staff of that county's public hospital.

2. A copy of the letter sent to the Board of Supervisors of San Luis Obispo County, stating why the attending staff took the action noted.

* * *

(Copy)

POLITICAL MANAGEMENT INTOLERABLE, IS CHARGE

All physicians, surgeons, and dentists in San Luis Obispo have withdrawn from any connection with the General Hospital, until changes in the administration are made by the board of supervisors.

The doctors and dentists, in a letter signed by every member of the county medical and the dental associations, and delivered to the county clerk on Thursday morning, resigned from the visiting staff of the hospital.

Complete lack of coöperation between the supervisors and the visiting staff was given as the reason for the resignation. The county board is charged with refusing to act on the suggestions and recommendations of the staff.

The staff is composed of all the doctors and dentists residing in the county, and the work of supervising and assisting in the hospital activities is rotated among them.

Give Reason

Discussing the reasons behind the resignation, the physicians said:

"We have a county hospital which represents an investment of approximately $350,000, and a fine institution. The county medical association organized a visiting staff and tried to operate it as a high-class institution. We have had a rotating staff, changing each three months and working with the county and resident physicians at the hospital, with the hospital doctors under our supervision. All this work has been given gratis by the doctors and dentists of the county.

"In six years of constant effort we have tried to get the hospital as approved and we secured this approval only a few months ago, putting the hospital on a par with the best in the country.

No Coöperation

"But we have been having increasing difficulty in getting coöperation from the board of supervisors, especially in the past few months. We have been trying to get the supervisors to let the doctors of the county assume complete control of the institution, including supervision, and the direction of the county and resident physicians.

"We also are asking for a separate welfare department for the hospital. We believe the people know that there are many patients admitted to the hospital who have no business there, no matter what their income or what might be their ability to pay for hospitalization or medical and treatment costs. This is unfair to the taxpayers who have to pay for the cost of taking care of these people.

"The board of supervisors has completely ignored this situation, and the doctors feel that the hospital has become a political football, with anyone securing an order from a supervisor entering the institution, without regard to the right or need of the patient, to have such free service.

"Twice in the past three months the supervisors, without asking the advice or opinion of the visiting staff, have appointed doctors who have not been admitted to the practice of medicine in California. It was necessary for the State Board of Health to send down representatives to tell the doctors to stop practicing or go to jail, which stopped their continued duties at the hospital.

Work Harmoniously

"Between the doctors of the county, the county and resident physicians and the nursing staff and employees of the hospital, there always has been close coöperation, and patients have been properly cared for.

"It is the unanimous opinion of the medical and dental societies of the county that they can no longer work with the hospital so long as the supervisors continue their present attitude.

"The situation has been growing worse for the past year and a half, and the doctors and dentists of the county want no part in the hospital as it now is being conducted by the board of supervisors."

It was explained that the request for a separate welfare department for hospital cases was needed so that investigation of the ability to pay of patients might be established, so that only really indigent cases, for which the hospital is operated, and the only type of patients admissible under a Supreme Court ruling, would become patients, while those who can pay should go to private hospitals.—*San Luis Obispo Press*, December 16, 1938.

* * *

TEXT OF DOCTORS' LETTER

(Copy)

San Luis Obispo, California
December 14, 1937

Board of Supervisors
County of San Luis Obispo
San Luis Obispo, California

Gentlemen:

Since the establishment of the San Luis Obispo County General Hospital the physicians and surgeons and dentists of the county have organized and maintained an active visiting staff at the hospital. Through their efforts and with the kind coöperation of the nursing staff, the professional standards of the institution have been raised to the point where indigent patients have been receiving professional and nursing care favorably comparable to that received in any public or private hospital. This fact is attested by the recent recognition given our hospital by the American College of Surgeons when they placed it on their approved list of hospitals. This means that the hospital has successfully met the high standards required by that organization throughout the country.

Several months ago we called your attention to the fact that certain methods of operation in connection with the San Luis Obispo County Hospitals were unsatisfactory. We suggested a possible remedy. Nothing has been done to correct the situation. We feel that under the present political management of the hospital, conditions are intolerable. Therefore, the visiting staff of the hospital, in regular meeting assembled, December 7, 1937, unanimously resigned from active service at the hospital, effective immediately.

We wish to remind you that since the establishment of the hospital we have given freely of our services without remuneration—and we might add without the slightest token of thanks or appreciation from your body. We wish also to remind you that throughout the history of the institution there has been a complete absence of friction between all members of the working staff of the hospital. We still stand ready to give our services to the County Hospital, provided that institution is operated for genuinely indigent patients and free from political influence. It is our feeling that this can be accomplished only by giving the visiting staff full control of the scientific operation of the hospital and by the establishment of a social service department at the hospital responsible to us, and to nobody else.

Yours very truly,
(Signed): E. D. ANDERSON,
Secretary, Visiting Staff, San Luis Obispo General Hospital.

* * *

[Comment.]—This concludes the series of exhibits, presented in connection with editorial comment, in this February issue of the OFFICIAL JOURNAL of the California Medical Association. What has been given above presumably only deals with the surface of the principles and facts involved. Every county medical society, through its committee on hospitals, and constituted authorities, should know what is going on in its own county hospital; and any procedures and methods seemingly at variance with the law of the State should be promptly reported to the central office of the Association. The members of the Los Angeles County Medical Association certainly should take an interest in the unusual innovations recently instituted in their own county hospital.

727 Roosevelt Building.

THE LURE OF MEDICAL HISTORY†

ROBERT ARMISTEAD McLEAN*

CALIFORNIA'S FIRST MASTER SURGEON

IV

By Robert T. Legge, M.D.
Berkeley

THE world was startled when, in 1849, gold was discovered in California; and many adventurous gold seekers rounded the Horn that year. Among these were Dr. Samuel Merryweather McLean and his wife, Ellen Grey Jeter McLean, both natives of Virginia. This pioneer physician was attracted to the Mother Lode Country, and was finally located in Stockton, where he built the first hospital and the second frame house. Doctor McLean was a busy worker in the hospital. As early as 1852 it was crowded with smallpox patients, victims of a raging epidemic then in progress. The Odd Fellows, of which the doctor was a member, have chronicled that he was one of the most sympathetic and generous of men. In the frame house on January 6, 1851, was born Robert Armistead McLean, the first white child of Stockton, destined to become California's first master surgeon.

DAYS OF YOUTH

Young Robert received his early education at the family fireside and at the little school of the small town. In 1860 his mother took him on a visit to her brother's plantation at Point Coopée, Mississippi. At the outbreak of the Civil War she was, fortunately, able to get through the lines by way of Nashville, and so to reach Bethlehem, Pennsylvania. There she remained with another brother, John Tinsley, until 1863, when she and her daughter, Mary, returned to California, leaving Robert at Doctor Schwartz's Bethlehem Academy. While at Bethlehem he taught a Sunday-school class at the Church of the Nativity. In 1866 he returned to the family home, then at Copperopolis, California. At the age of eighteen he became an apprentice in the study of medicine under his father.

In a letter to Uncle Jeter, dated from Tuolumne City, July 27, 1870, he relates that he was teaching in the district school, though apparently disliking it. His ambition was to go to the California University as soon as circumstances would permit. Discouraged because of the failure of crops and the meagerness of his father's practice, Robert was, nevertheless, hopeful that, by saving $50 of his $75 a month salary as teacher, he would be able to accumulate sufficient money to support himself for one year.

AN INTERESTING STORY

There is a story to the effect that the celebrated Dr. Hugh Huger Toland of San Francisco, founder, in 1866, of Toland Medical College which, in 1872, became the medical department of the University of California, had some difficulties with a fellow who menaced his life. Through the efforts of Dr. Samuel M. McLean, who befriended Doctor Toland and who succeeded in getting him out of these embarrassing difficulties, was developed a mutual friendship which made it possible for the elder McLean to request a great favor of Doctor Toland, namely, that he should become the preceptor of his son, Robert. He was thus accepted, and began to take lectures at the college.

TOLAND MEDICAL COLLEGE

Doctor Toland was professor of surgery and taught in the college he founded, which was described in an announcement of the time as "a massive brick and stone edifice, one of the most complete and stately medical colleges in the country." The college had a museum that contained an extensive collection of specimens and preparations, a dissecting room fitted with all the modern improvements, and a laboratory replete with all the chemicals and apparatus necessary for practical teaching.

MEDICAL STUDENT DAYS

It was here that the talented Robert A. McLean labored as a student in medicine. His early student days were those of a continuous struggle for existence: he acted as janitor and even slept in the college building; later he lived in the office of Doctor Toland, who occasionally gave him a few dollars for food. He said that he was often actually hungry. As a student he became keenly interested in the study of human anatomy, and mastered it. While at college he acted as preceptor and later as demonstrator of anatomy.

At the commencement exercises in 1874 he was graduated—the first native son to receive the degree of Doctor of Medicine.

TEACHER AND DEAN

It followed that the graduate became a member of the faculty as lecturer in anatomy and as secretary to the dean, Dr. R. Beverly Cole. During this period, he also continued his association with Doctor Toland, whom he assisted in his private practice and in his duties as professor of surgery at the county hospital. This afforded the young doctor the opportunity of his life to become a surgeon. In the meantime he was elevated to the position of professor of anatomy. Then he succeeded to the chair of clinical and operative surgery when Doctor Toland died in 1880. He held this professorship until his retirement. Doctor Toland, in his will, bequeathed "to the most competent man to succeed me, my office, furniture, instruments, library, and practice." The office, located at 603 Merchant Street, corner of Montgomery Street, was where Doctor McLean commanded the largest surgical practice in California until 1897 when, at the height of his activity, he was stricken with hemiplegia. From 1881 until

†A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of California and Western Medicine. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

* One of the papers given in Toland Hall, University of California Medical School, San Francisco, in the series on the history of the institution, arranged by the Division of the History of Medicine.

This is Paper IV of the series. For other articles in the symposium, see California and Western Medicine, November, 1937, page 321; December, page 405; January, page 27.

1899 he was also dean of the college, finally being succeeded by Dr. A. A. D'Ancona. What an abundant life was crowded into these eighteen successful years!

MC LEAN FAMILY

Doctor McLean's sister, Bessie, was married to one of his honor students, Dr. C. W. Evans of Modesto, of the class of 1881. They became the parents of Dr. Herbert McLean Evans, the distinguished scientist of our University of California. About this same time, in June, 1881, Miss Alice May Thompson, a native daughter from Benicia, became the wife of Dr. Robert A. McLean. She bore him three sons, Robert A. Jr., Tinsley, and Arthur T. McLean. A cherished ambition of Doctor McLean was to have one of his sons follow his footsteps in the study of medicine; the failure of one or the other of them to do so was a great disappointment to him.

MEDICAL CATALOGUE ANNOUNCEMENTS OF 1880

A review of some of the printed announcements of the time, concerning Doctor McLean's professorship in surgery in 1880, will give an idea of the high quality of practical and scientific instruction that he instituted for the medical students in the "Far West" of three score years ago:

"Surgery.—Instruction in this department will embrace: First, a regular course of lectures on the principles and practice of surgery; second, demonstrative surgery upon the cadaver; and third, a thoroughly clinical course, including diseases of the genito-urinary apparatus, at the City and County Hospital and College Building."

"Didactic Teaching in Surgery.—Professor McLean delivers three lectures each week on the art and science of surgery. The most recent views of the management of surgical conditions and the appliances devised for their relief are particularly dwelt upon, and illustrated with drawings and models, when necessary. This course will include a series of lectures upon operative surgery, with demonstrations on the cadaver. The student will be drilled in the manipulation of instruments used in the various operations."

"Minor Surgery.—Professor McLean conducts a course of minor surgery during the preliminary term. Instruction in this branch includes the application of bandages and various dressings used in treating wounds, fractures, dislocations, etc."

MASTER SURGEON

Some years ago, in a personal conversation, Dr. Emmet Rixford, then professor of surgery at Cooper College, speaking of Doctor McLean, remarked that he was truly California's master surgeon, an ethical man whose professional advice was sought by his colleagues. He had great native ability, acquired only through his own studious endeavors, never through observations or experience gained in the great hospitals and schools abroad. He was never able to take time off for any foreign travel. Dr. Emma Sutro Merritt, one of his students graduating with the class of 1881, San Francisco's first woman surgeon, who also received a medical degree from the University of Paris after five years of study in Europe, commenting on Doctor McLean, stated that he was a greater surgeon than any of the reputed surgeons she had seen abroad. "He lived," she said, "in the wrong part of the country; his place should have been in the world's largest metropolis."

ROBERT A. McLEAN, M.D.
1851–1914

AN IN MEMORIAM TRIBUTE

Dr. Rawlins Cadwallader of San Francisco published an article entitled, "In Memoriam," in the *Compend of Medicine and Surgery* for November, 1928. In this article he paid tribute to his old chief. I quote a paragraph which speaks of the period subsequent to his stroke:

McLean was of the old school of surgery. He had his training in pre-aseptic days and was one of the few such men who grasped the significance of, and consistently followed, asepsis. His operative dexterity was a marvel. I have seen Murphy, Bull, Senn, Halstead, Keen, Horsley, Kocher—the world's most celebrated operators—and I assert positively that none of them even approximated McLean as an operator. He was by all odds the most rapid and dexterous operative surgeon the world has ever seen. To see him work did not impress one with the fact that he was fast, but it was an exhibition of precision. Not a movement lost, not a motion but had its place. He never snapped but once for an artery, never hesitated over anatomy, never changed sides until half-done, and tied his knots almost faster than the eye could follow his hands.

He was an absolute master of anatomy, and once remarked that it was like letters to one who could read. When one was a surgeon, he did not need to think of his anatomy."

AUTHOR'S RECOLLECTIONS OF DOCTOR MC LEAN

To reminisce: My own student days as an upper classman were near the end of Doctor McLean's clinical teaching career at the old surgical amphitheater of the City and County Hospital in the years 1897-1898 and 1898-1899. In my memory, like a picture, still lingers the impression of the time when I was first introduced to operative surgery and to Doctor McLean—impressions of a tall, lanky, dark-complexioned man, with black hair and a close-trimmed beard. He reminded me of a great

genius of the Lincoln type and character as he stood in the arena, dressed in his immaculate street trousers and polished shoes, a short white coat over his vest, his long ungloved hands and fingers washed and treated with bichlorid, and calling out to the senior who was assigned to the chloroformed patient on the table, "Whose case is this?"

He expected a complete history, a diagnosis, method of surgical treatment, and a knowledge of applied anatomy. He would demand reasons for the students' diagnoses, present arguments, ask for proofs, challenge their validity, all with the purpose of clarifying and crystallizing the picture in their minds, training their interpretive and diagnostic judgment. These quizzes in differential clinical diagnosis and surgical anatomy were an experience in inspired teaching. As professor of clinical surgery, perfect anatomist, remarkable diagnostician, endowed with marvelous judgment and precision, this great genius possessed all the attributes of perfection in his field. Remember, too, that those were the days of antisepsis, before the advent of modern asepsis and the roentgen ray. Laboratory procedures were comparatively primitive and chloroform was the main anesthetic.

With a few master strokes of the scalpel, with unparalleled speed in a field that was practically bloodless, with a superb technique original in many of his operations, he exhibited the work of a great master. To witness a complete hip-joint amputation; the femoral artery severed and caught instantly with a forceps, stitched, dressed and completed in twenty-eight minutes, was an experience never to be forgotten. He regarded it as unpardonable if a drop of blood stained his coat or appeared above the knuckles. His surgical nurse at the County Hospital, Miss Kane, who could read his mind, and who knew always and instinctively what instrument or ligature was required—for when he thrust his right hand backward toward her table, the desired article was at hand—must be remembered with respect and admiration.

HOSPITAL ROUNDS

What a treat it was to make the rounds with him and to watch him examine a patient and notice his careful and watchful survey of the field where pathology was present. It seemed that the very ends of his fingers possessed eyes, so acute was the tactile sense and his ability to interpret what he felt and observed.

In the wards, where there were always many fracture cases, the present-day orthopedist would marvel at the dexterity of this great and skillful surgeon in diagnosing and reducing a fracture and achieving such astonishing results. In his male surgical ward, consisting of thirty-two beds, was a male nurse named O'Connor, who was trained by the chief as a dresser, and whose knowledge of traumatic surgery was unusual. It was really unbelievable to see this remarkable man reduce complicated fractures and dislocations. Doctor McLean seldom disturbed, after examining, O'Connor's "cases." Woe to the intern or poor senior student, however, who, upon being questioned as to the diagnosis of such a case, should reply that O'Connor had made the diagnosis!

I believe that it was during the time that the American Medical Association met in San Francisco that a surgical clinic was held to demonstrate a new operation for vaginal hysterectomy. Three cases were to be operated upon: one by a celebrated New York gynecologist, the second by the great Philadelphia surgeon, Dr. W. W. Keen, and the third by the apparently unknown Robert A. McLean. Doctor McLean surprised everyone present by performing the operation in half of the record time.

We students remember his dry humor during the clinic hours at the County Hospital. A usual remark to a patient who had some minor abscess that did not warrant a general anesthetic was, "What nationality are you?" If the answer were "Irish," Doctor McLean would play up the bravery of this race; the patient would respond, and before he had time to think the abscess would be incised.

He employed another ruse in respect to malingerers occupying "political" free beds who claimed, for instance, that they had sciatica or backache. After Doctor McLean had examined the patient, with pseudoseriousness he would turn to the intern and say, "Doctor, this poor man can be cured by singeing along the spine with a red-hot iron. Have it ready tomorrow morning." If the patient were a genuine malingerer, the bed would be empty at the appointed hour.

DOCTOR MCLEAN AS DEAN

In his position as dean of the college, Doctor McLean gave the impression of austere unemotionalism, which belied his true nature. Perhaps this was due to the great responsibilities he carried both in his private and in his public practice. But those really acquainted with him knew that he would do anything within his power for his poor patients, especially for the members of his beloved profession. Many practicing physicians owe their starts to Dean McLean. Many a promising young student, unable to continue his medical training because of financial inability, was aided by this kind man, who advanced the funds and charged them to his own private account. His whole interest was in higher medical education and in the welfare of medical students.

His duties as dean of the college, professor of clinical surgery, and his lucrative practice demanded much of his time and effort. Nevertheless, he never missed his classes or County Hospital clinics; he was punctual to the minute. Those were the horse-and-buggy days, when he kept two teams always in readiness to enable him to attend to his large practice and hospital work.

Doctor McLean's real respect for members of the regular profession was characteristic. He was punctiliously ethical in all his relationships, particularly in the education of medical students, and to his patients. Notwithstanding his busy professional life, he spent many hours in reading the classics and great books. He was familiar with the current medical literature, enjoyed the drama, and

was a patron of grand opera. It was his especial joy to read aloud to his wife and boys. His priceless collection of books was lost in the great fire of 1906.

MACLEAN CLAN

At his home on Pacific Heights he was fond of receiving his colleagues in the medical profession, distinguished visiting notables and faculty members from Berkeley. He enjoyed displaying the McLean plaid to visitors, and was proud of the fact that, while attending the Columbian Exposition at Chicago in 1893, he had met Sir Le Roy Donald Maclean, chief of his clan of the Isle of Mull.

Doctor McLean held memberships in the medical societies of California, but seldom, if ever, attended the meetings. In the line of social organizations he was affiliated with the Sons of the American Revolution, the University of California Club, and Family and Caledonian clubs of San Francisco. He was a man of deep religious convictions, by faith an Episcopalian. A student of the Bible, he was able to repeat whole chapters from memory. During the last years of his life, he attended St. Mark's Episcopal Church in Berkeley, where Bishop Parsons was rector.

EARLY MEDICAL JOURNALS OF CALIFORNIA

Among the early medical journals published in San Francisco was the *Western Lancet,* which appeared in 1872. This periodical, before its merger with the *Pacific Medical and Surgical Journal* in 1884, was practically the official organ of the Toland College faculty. Doctor Toland published therein many of his case reports and accounts of his surgical operations and procedures. Many of these Doctor McLean collected and edited. However, it was this editing that discouraged McLean as to the value of publishing papers; he wrote very few during his life. At Doctor Toland's demise, his brilliant associate succeeded him, to become the foremost surgical practitioner on the Coast. In spite of the many daring and original surgical operations that he performed, he left few published contributions for posterity.

In the *Western Lancet,* December, 1880, there appeared, under "Original Communications," a valedictory address by Doctor McLean, delivered on behalf of the faculty at the annual commencement, November 10, 1880. After the usual advice given to the young graduate—as to his relations to patients and to the profession—he admonished quacks and nostrums of the day. He exalted the regular profession and the health officers in checking a plague that was at that moment prevailing. Then he made a plea for a general State Hospital for all indigent sick—to be located in the commercial capital and largest city, San Francisco. Concluding his address was a eulogy paid to Professor Toland, whose perfect character he held up as a lofty model for the contemplation of the young doctor.

CONTRIBUTIONS TO THE LITERATURE

His special interests apparently were centered in malignancy and tuberculosis. Upon these subjects three papers were published:

"The necessity of Early Surgical Interference in Malignant Growths," *Journal of the American Medical Association,* 1894.

"Cancer of the Rectum," *Transactions of the Medical Society of California,* 1895.

"The Superiority of Amputation Over So-Called Conservative Methods of Treatment of Tubercular Disease, Injury and Malformation of the Lower Extremities, *Pacific Medical Journal,* 1895.

He also wrote a manuscript for the *Cyclopedia of American Surgeons* on Hugh H. Toland, a copy of which is now preserved in the Crummer Library of the University of California Medical School, the gift of Professor Howard Naffziger.

It is said that McLean devised an original operation for cleft palate, for which a special instrument was invented. His interest in young men's leading clean and industrious lives caused him to publish, in 1908, a small monograph, *Letters of Advice to a Young Man.*

RETIREMENT FROM CLINICAL TEACHING

In 1898 Doctor McLean found himself so broken in health that he finally gave up his clinical teaching at the County Hospital. He was succeeded by Dr. Charles Brigham of San Francisco and later by Dr. Thomas Huntington of Sacramento. He became emeritus professor of clinical surgery in 1903, an honor which he held until his death. On May 10, 1899, the secretary of the faculty wrote Doctor McLean:

"At the last regular meeting of the faculty, your resignation as dean of the department was with much regret accepted. It was resolved that the thanks of the Faculty be extended to you for your long and valuable services, with profound esteem and respect felt for you personally, and their appreciation of your efforts in building up the College."

HIS FAMILY LIFE

During the next twenty years of his life, his professional activities curtailed and his beloved teaching finished, Doctor McLean felt deserted and saddened. His loneliness was augmented by the loss of his wife, in 1897. He has written of her: "When Alice was alive she went to the market herself every morning; and brought home such articles as she could conveniently carry in a basket. She had a keen sense of humor, a rare quality in feminine nature, and the sweetest, most amiable disposition of any human being I ever knew. She would act out the drama that she had seen performed, for the benefit of me, when the pressure of a large practice had prevented my attendance at the theater." The sweetest romance of Doctor McLean's life is the charming and lovely story of his meeting with Alice, in 1880, when he was on a professional visit in the town of Benicia, California. This distinguished young San Francisco surgeon was dining in one of the restaurants of the town. At another table there was a young lady, a student in attendance at St. Mary's Hall. Doctor McLean was so attracted to the demure, quiet, small and lovely young woman of nineteen that he

pressed one of the attendants to arrange for an introduction. It was love at first sight; and a short while afterward "Sweet Alice" was to be Mrs. Robert A. McLean.

TOLAND MEDICAL CLUB

Responsive to the invitation of R. A. McLean, an interesting meeting of the University of California Club took place on November 20, 1914. Those present were E. D. Martineaut, '73; William H. Mays, '73; J. R. Davidson and R. A. McLean, '74. The purpose of this gathering was to organize a club, consisting of the earlier members of his college associates. Doctor Martineaut was elected president and Doctor McLean, secretary. The club was for social purposes only. In order to discourage all scientific discussion and to foster good fellowship and a spirit of fraternity, the chairman, always the oldest graduate, was to condemn anyone starting a like discussion to the execution of such penalties as singing a song or making a speech. This Toland Medical Club was to be modelled after the immortal "Pickwick Club" of Dickens. The minutes of this first meeting are to be presented to the Crummer Library archives.

RETIREMENT DAYS

During Doctor McLean's retirement period he took his first voyage to Europe. While visiting Glasgow he consulted the then famous surgeon, Sir William McEwen, who diagnosed his case as a gliomatous tumor and advised an operation, declined by McLean. (Doctor McLean's early retirement was due to unilateral ataxia, due to the old hemiplegia). His surviving sister, Mary Ellen McLean, during his absence supervised his home and cared for his three growing sons. This pioneer woman died at Berkeley on April 1, 1937, at the age of eighty-five.

SUBSEQUENT YEARS

After the earthquake in 1906 and until 1915, McLean occupied an office with one of his old colleagues, Dr. George H. Powers. At this office, at the corner of Ellis and Powell streets, he enjoyed quite a little practice among old friends and charity patients. His good friend and office nurse, Miss Ann Sullivan, assisted him in his work. She relates that the number of types of minor office surgery he performed was surprising.

In the last days of his retirement he resided at Cloyne Court, in Berkeley. On December 4, 1918, he succumbed at Alta Bates Hospital as a result of influenza and pneumonia. The funeral took place at the home of his nephew, Dr. Herbert McLean Evans. After an Episcopal service, he was laid to rest in the Iona Churchyard at Cypress Lawn Cemetery in San Mateo County. Two of his former students, Dr. Wallace Terry and the writer, acted as pall bearers. On his gravestone is the Crest of the Clan McLean with its motto, "Altera Merces." How beautiful and appropriate were the translated words, "Another Reward," as the curtain was finally drawn in the passing of the foremost pioneer master surgeon of California.

University of California Medical School.

THE PASSING OF PROFESSOR GEORGE H. F. NUTTALL

By Douglass W. Montgomery, M.D.
San Francisco

A SHORT notice in the daily papers has notified us of the demise of Dr. George Henry Falkiner Nuttall, professor of biology, Cambridge, England. Doctor Nuttall was a remarkable man in his own right, but he had a special interest for us in San Francisco, for he was of our city; and in 1886, when I came here, he was slated for the chair of pathology in the Toland Medical College, then loosely connected with the University of California. His notable work on the blood, however, secured for him such recognition that he was called to Cambridge.

Doctor Nuttall's father practiced medicine for many years in San Francisco, in association with Doctor Mackintosh, in offices on Post Street, just west of where now is the Mechanic's Library. Their chief work was obstetrics and, as Dr. David Cohn once told me, they delivered almost every woman in this city in their day, or rather night, and if anyone wishes to learn how dexterous Mackintosh was in handling the forceps, let him consult Dr. George F. Shiels. They say that Nuttall was equally expert. When Robert Kennedy Nuttall and Dr. Robert Mackintosh were in full practice, obstetrics was, as Cohn also informed me, very lucrative. Consequently Nuttall, who had married into the Parrott family, became quite comfortably situated.

Mackintosh was not so fortunate. He was incorrigibly careless in his financial habits, and by the time I came here his practice had dwindled, as practices have the habit of doing. He lived as a bachelor, and had a modest office far out on Mission Street. There was, however, no doubt of the grandeur of the man with his noble features and flowing white beard, sitting erect while driving his horse and buggy. "A man's a man for a' that," was written in his every lineament.

Because he was supposed to have Bright's disease, Nuttall retired from practice in 1865—a grave resolution. In that day albuminuria and a few hyalin casts portended early death, whereas albuminuria occurs to many a man in good health, and a few hyalin casts carry with them, as Osler once said, a guarantee of a long life. I had a brother-in-law who, in his youth, was condemned to a year in bed on the same evidence, and he lived to be past seventy.

Doctor Nuttall's father traveled about Europe for eight years. As Victor Hugo once said, there are two kinds of hell: one in which you are tormented, and one in which you are bored, and the latter is the worse. After walking through picture galleries, and conversing mostly in monosyllables with waiters and cab drivers, Nuttall returned to San Francisco and resumed connection with his old friend, Mackintosh. He terminated this life in 1881, sixteen years after the above-mentioned grave diagnosis, and then only through inadvertence, for he went fishing with his friend, Mackintosh.

As I understand it, it was the grandfather of our Dr. George H. F. Nuttall who was the Nuttall of Kew Gardens, after whom so many plants are designated as "Nuttallii." His sister was the late Azalea Nuttall, the well-known antiquarian, so learned in the history of Old Mexico.

With such a family history, that George H. F. Nuttall should have attained prominence in the development of modern medicine was, therefore, no accident.

CLINICAL NOTES AND CASE REPORTS

THE PROCTOVACUATOR

By Chelsea Eaton, M.D.
Oakland

THE successful proctoscopic examination, like the successful surgical procedure, depends upon good exposure. Many of the attempts to perform a satisfactory proctoscopic examination are frustrated by feces which block the advance of the instrument. Unfortunately, the "careful preparation" of the lower bowel by enemata is frequently inadequate, and the attempts to remove the detritus by suction tube and swabs are of little avail.

Obviously, the purpose of the proctoscopy is defeated by any method which is not concerned with obtaining a clean bowel as a preliminary to examination.

For example, the use of the 15-centimeter proctoscope, instead of the 25-centimeter instrument, provides increased facility of instrumentation and may partially obviate the necessity of obtaining a clean bowel. However, there is proportionate devaluation of the findings because of shorter tube employed. Again, the practice of passing the proctoscope, with obturator inserted, through masses of feces which confront the advancing tube can afford little satisfaction to the examiner because of fields which have not been visualized.

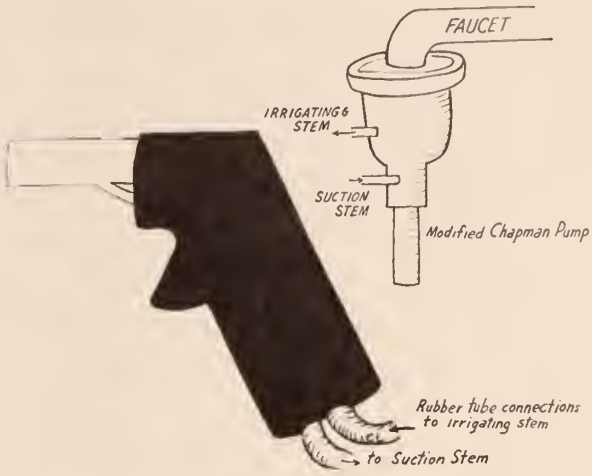

Fig. 3.—Showing tube connections of proctovacuator and pump.

The desideratum is a clean bowel. A suction apparatus is patently insufficient because of fecal blocking. A device that will provide alternate irrigation and suction through a single tube will not only keep the lumen free, but will provide a hydraulic stream which will disintegrate fecal masses and facilitate their removal by the suction apparatus.

The instrument described herein combines the factors of suction and irrigation in reciprocal relationship. Thus, while the trigger is at rest, a stream of water is sent through the barrel and the fecal masses are disintegrated. Conversely, when the trigger is pressed, the irrigating stream is interrupted and the bowel contents are evacuated. A rapid, alternating process of irrigation and evacuation enables the operator to obtain a clean field for inspection, and permits him to advance the proctoscope to its full extent. Barrels of various lengths may be interchanged according to the length of the proctoscope used. The instrument is readily cleaned by operating it while the barrel is inserted into a cleaning solution. A Chapman pump, which

Fig. 1.—Showing proctovacuator assembled. A, detachable barrel. B, bakelite pistol grip. C, suction tube. D, irrigation tube. E, trigger control.

Fig. 2.—Proctovacuator mechanism. The right half (B) of the bakelite pistol grip has been removed to illustrate the trigger mechanism (F). While trigger (E) is at rest as shown, the irrigating tube (D) is compressed by strips of tempered metal which surround it. In this position, also, the suction tube (C) is open. However, when the trigger is pressed the action is reversed in each tube because the strips surrounding the irrigation tube (D) are forced apart and the strips surrounding the suction tube (C) are forced together. (G) metal chamber which connects rubber tubes to barrel.

contains an outlet stem above the suction stem, is used as a combined source of suction and irrigation.

SUMMARY

Some common obstacles to the performance of proctoscopy have been pointed out, and an instrument described by which these may be overcome.

SQUAMOUS EPITHELIAL BONE CYST OF THE TERMINAL PHALANX*

By William W. Reich, M.D.
Berkeley

THIS report is prompted by the recent article by Bissell and Brunschwig.[1] These authors, after presenting a short review of the literature, add two new cases. They also call attention to the probable rôle of trauma in the genesis of the pathologic lesion.

REPORT OF CASE

A German female, aet. forty-three, complained of a tense, painful and tender spot near the tip of her right first finger. She stated that this "sore spot" had been noted for about six months, but that she had absolutely no recollection of having injured the finger in any way. About two weeks previously, a doctor had incised the tip of the finger and she stated that this eased the tension. Her past and family histories presented no relevant data. Examination revealed a very tense, slightly reddened, moderately tender finger. A small zone on the inner border appeared fluctuant. The base of the nail seemed slightly raised. X-ray examination, April 7, 1937, presented the rather striking findings shown in Figure 1. The radiologic diagnosis was chronic osteomyelitis; however, bone cyst, chondroma or other neoplastic process were suggested as possibilities. On April 18, 1937, under local anesthesia, the overlying soft tissues were incised and the underlying bone thoroughly curetted. A fairly well-defined, whitish, membranous shell measuring about 2 by 3 millimeters was scooped out in the process. A small wick was placed in the wound and moist dressings applied. The wound healed rapidly by first intention. No suppuration was encountered either at the time of operation or subsequently. X-rays, taken on May 25, 1937, are shown in Figure 2. It is apparent that very little filling in had taken place, except for the small deposit about the cyst edges. Histological examination of the small shred obtained at operation revealed the wall of a bone cyst lined by typical stratified squamous epithelium. Figures 3 and 4 show, respectively, low- and high-power magnifications.

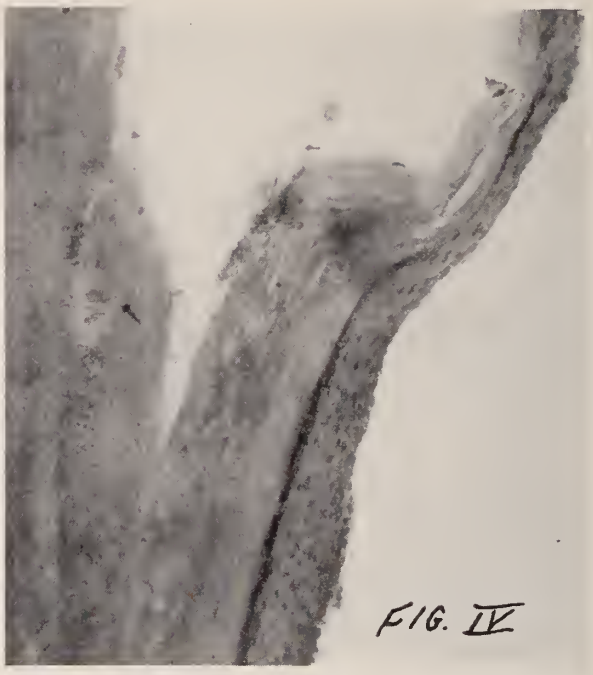

Fig. 4.—Stratified squamous epithelium lining cyst as seen under high powers of the microscope.

In the article quoted above, a discussion of the theories of the origin of these interesting structures is presented. The trauma theory probably explains most cases; however, in some instances, as in the present case, no history of injury could be obtained. It appears that diagnosis must rest upon pathologic examination of curettings, since confusion with other lesions cannot be eliminated by gross examination or radiologic studies.

2236 Durant Avenue.

* I wish to thank Dr. R. D. Joldersma for the opportunity of seeing this patient.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

INSOMNIA

I. ETIOLOGY

Lovell Langstroth, M.D. (516 Sutter Street, San Francisco).—If one questions a patient with insomnia as to why he or she cannot sleep, the answer invariably will be, "Because I cannot stop thinking." And this seems to be the fact. These patients cannot sleep because they have a compulsion to thought. This state may be brought about in a perfectly normal person by some unusual event; a disappointment in love, the death of some member of his immediate family, business reversals, or physical disease. But these normal persons recover from their physical disease or adjust to the new conditions in a reasonable time, and soon sleep as well as before, while the persons under discussion present no physical disease, have nothing serious to worry about, and still are permanently unable to sleep satisfactorily. In them the disturbance of function is traceable to an inner, rather than to an outer cause, and must be treated along psychological lines if it is to be permanently overcome. For drug therapy is not only unsatisfactory to the patient himself, but finally fails to give him the rest he craves. Discussing the etiology of insomnia, then, really means discussing the etiology of this compulsion to thought; and what I shall attempt here is to sketch in briefest outline the psychological processes which force these persons against their will to awake nights and "think."

An analysis of this process shows that the conscious will of the patient to sleep is opposed by this compulsion to thought, or by an opposing will, so that we find here two opposing will forces. The greatest light has been thrown on these will forces by Otto Rank,[1] who speaks of them as the positive and negative will. But to understand what is meant by these terms it will be necessary to review briefly the development of the will as he has sketched it in the individual.

We must remember, in this connection, that the individual was once a part of the mother from whom he sprang, and that in infancy at least, he always yearns for her and resents separation from her.[2] This state of affairs forms the basis for the development of two elemental forces in the individual, one of which we may call positive and the other negative. At or about puberty these more primitive urges become partly differentiated into the positive and negative will, that is to say they become more conscious and subject to control. The average person, then, takes on the pattern he is to follow during the remainder of his life: he projects his opposing will onto some outer authority (parent, social will, government), and, now that he has delegated the job of restraining him to someone else, feels free to accept and express his positive will, and with it the racial sexual compulsion, or the positive primitive urge.

But there are certain strong-willed persons who differ fundamentally from the average in their inheritance and development. From birth on they have a stronger desire for union with the mother, and when separation from her is forced, resent it more: they hate the mother for causing them this pain. They also react in an exaggerated way to the pain of this separation, that is to say, instead of accepting it they deny the desire and its object altogether so as to save themselves pain. This is as much as to say: "I do not care, I did not want it anyway." The average person denies desire, too, but only until the intensity of the pain of separation has diminished, while these strong-willed persons continue the denial indefinitely. This does not change the true state of affairs, of course: the strong desire and hatred are still there below the surface. Later on these more primitive forces differentiate into will forces, but the denial is carried over into the realm of the will, prevents the individual from coming into positive affective relation with the object, *i. e.*, prevents his psychological growth, and so the will retains its primitive negative form. Any expression of this negative will is condemned by the parents as badness, and this parental attitude gives the individual another reason for denying his will, *i. e.*, for saying in effect: "I am not bad, I have no will at all." Since the will represents the person's individuality, and his happiness depends on his acceptance of his individuality, this denial becomes of great psychological significance. Thus we see that in certain strong-willed persons the will remains predominantly negative and is denied, that is, cannot reach consciousness. But the will continually strives to break down this barrier and appear in consciousness. Here, then, are two opposing forces, consciousness and the negative will, each striving to overcome the other. Of course, the situation is not quite as simple as this; the oversimplification is for the purpose of giving the general idea. I have used the word "predominantly" negative to signify that the will was not completely negative. In many of these strong-willed persons the aberration is too slight to make a major disturbance in their life. But their feeling tone is poor and they do not really enjoy life. Their will tends to oppose their own normal functions (life), as it opposes everything in the outer world, not enough perhaps to make life impossible, but enough to make it unhappy.

1 Rank, Otto: Wahrheit und Wirklichkeit. Leipzig und Wien: Franz Deuticke, 1929.

2 Rank, Otto: Grundzüge einer Genetischen Psychologie. Leipzig und Wien: Franz Deuticke, 1927.

In others the aberration is sufficient to cause a psychoneurosis. Some psychoneurotics, the hysterical type, succeed in keeping all knowledge of the real state of affairs out of consciousness, but transform their suffering into physical symptoms. Others, the compulsion neurotic type, allow the will to reach consciousness as thought.

Let us now return to our discussion of the patient with insomnia. We see that his desire to sleep is an expression of his positive will to live, and his compulsion to thought an expression of his negative will. Since this compulsion to thought preponderates, we must infer that this person's will is predominantly negative and that, whether he admits it or not, he is a borderline psychoneurotic, or actually a psychoneurotic.

This is not the place to discuss the psychological treatment of these individuals. Suffice it to say that proper understanding of the strong-willed person, and of the principles laid down by Rank for therapy of the neuroses, makes it possible to permanently cure the larger part of these patients.

* * *

II. PATHOLOGY

Thomas G. Inman, M. D. (2000 Van Ness Avenue, San Francisco).—Any discussion of the pathology of insomnia must include those conditions responsible for the inability to secure normal sleep, since it is extremely doubtful if insomnia exists as a separate clinical entity. Inactive states are common to all living things, animal or vegetable, simple or complex, and serve to allow, after the expenditure of stored-up energy, a return to a state of stable equilibrium. Sleep, as we know it, in complex organisms, is a provision of nature devised to produce a more or less inactive state of the whole body in order that wasted tissues may repair themselves. The accompanying phenomenon, which we know as unconsciousness exhibited by higher forms, is due to the same inactive state of the upper nerve cell groups, chiefly, in man, the cerebral cortex.

The existence of a sleep center within the brain has been the subject of much discussion, especially since the encephalitis epidemic of 1917-1920. The concentration of the effects of the virus of this disease in the neighborhood of the midbrain and basal ganglia, with the almost constant somnolence, suggested the possibility that there might be located in this region some group of cells which controlled the sleep mechanism. It would seem to be in keeping with nature's efforts in the conservation of energy that some such control should develop in complex organisms in order that all structural units might be brought under control at the same time. However, it cannot be stated positively that such a center actually exists.

Pathological Anatomy.—Disease processes within the cranium may cause insomnia, but usually only in the beginning stages. In tuberculous meningitis, sleeplessness or restless and troubled sleep may be the first noticable symptom. On such a basis sometimes rest the "night terrors" of children. Septic meningitis and lethargic encephalitis frequently cause a few sleepless nights at the beginning of the illness. Cortical parenchymatous syphilis, cortical atrophy due to arteriosclerosis and decortication from any cause notoriously disturb the sleep cycle.

Tumors developing within the cortical sensory projection centers may, by stimulation, arouse the respective images common to that region and make sleep impossible. With the increase in intracranial pressure, however, or when tumors or inflammatory disease invades the region of the third ventricle, somnolence is the rule.

Pathological Physiology.—Increase in the rate of blood flow through the brain, brought about by various causes such as hyperthyroidism or an increase in the activity of other glands of internal secretion, may be the cause of obstinate sleeplessness. Some of these hormones act upon the cortical cells directly lowering the threshold of irritability.

There is a class of individuals who, in the absence of any special disease, are poor sleepers. They usually possess a more or less unstable vasomotor system to which may be added a volatile emotional nature. With them may be grouped the so-called visceroptotic type. The long body, small, central heart, low-lying abdominal viscera and poorly developed musculature lend themselves to a poorly sustained systolic pressure when standing. On assuming the horizontal position the blood is more evenly distributed, and the cerebral circulation takes on the character belonging to the waking period. Thus, tired and sleepy before retiring, once they are in bed they become wide awake and, like Achilles, bemoaning the death of Patroclus, lie first on one side, then on the other, now on the back, now on the face. Only when circulatory readjustment takes place do they fall asleep.

Pathological Psychology.—Under this heading most of our patients whose chief complaint is the inability to secure sufficient sleep may be placed. There are two main groups, the neuropathic and the psychopathic. In the former, mental conflicts cause psychovisceral reactions which, activating circulatory and glandular modalities, stimulate cortical cellular interplay within the sensory centers. Thus, phantasy formation, anxiety, real and imaginary fears and feelings of resentment prevent that relaxation without which sleep is impossible.

The various psychoses are frequently marked by obstinate sleeplessness, but the associated mental state soon makes itself known. There is one group, however, in which the underlying cause is not so readily apparent. It comprises those mild, sometimes recurrent, depressive states in which insomnia is frequently the only complaint. Observation will detect the gloomy aspect, and questioning elicit the fact that the mood is sad and pessimistic; that they are emotionally depressed, have no appetite and are unable to obtain any pleasurable feeling from the pursuit of those occupations and hobbies which they formerly enjoyed. These symptoms, which mark the underlying psychosis, are often overlooked because of the reiterated statements of the patient that he would be all

right if he could only sleep. Aside from pointing the way to suitable treatment, early recognition of the true state of affairs is necessary, for any sudden deepening of the psychosis may usher in that most important symptom—the impulse to suicide.

It cannot be stated positively that loss of sleep *per se* leads to any pathological alteration in the tissues of the human body. Chromotolysis has been observed within important cellular groups in the central nervous system in animal experiments. The findings, however, may not depend wholly upon a disturbance of the sleep mechanism, but upon associated phenomena.

* * *

III. TREATMENT

H. Douglas Eaton, M.D. (1136 West Sixth Street, Los Angeles).—Sleep, nature's preventive for excessive fatigue, is an involuntary habit. Insomnia is a disturbance of the sleep habit, and may occur in varying degrees in a multitude of diseases or simply as a result of bad sleep habits. Insomnia is a symptom, not a disease; and its adequate treatment is dependent on ascertaining the cause for its existence with elimination of this underlying condition. When the fundamental cause cannot be removed, or while it is being corrected, symptomatic treatment of the insomnia is often of great benefit to the patient. In a certain percentage of cases, relief of insomnia may be the determining factor in the patient's recovery.

In organic disorders, when the lack of sleep is directly due to severe and continuous pain, analgesics may be combined with hypnotics to give the patients the periods of relief from pain and the mental oblivion so essential to their recovery. The milder, less depressing, drugs should be tried at first. The combination of salicylic acid with moderate doses of some of the barbiturates is often sufficient. In more severe cases the opium derivatives, alone or combined with hypnotics, are justifiable. Codein or morphin combined with a barbiturate suffices in a large percentage of cases. Hyocin and morphin, in the familiar HMC combination, is a still more potent preparation. The intramuscular route of administration is most efficient when quick results are desired. Intravenous medication is, in the writer's experience, neither desirable nor necessary. Physiotherapy, especially hydrotherapy, may be considered, but is usually impractical in this group of cases. Its detailed discussion will be reserved until later.

Toxic causes are prime offenders in the production of insomnia. Coffee in excess, or even very moderate amounts of coffee in susceptible individuals, is a well-recognized sleep disturber. Alcohol or the excessive use of tobacco; tea, dietary indiscretions, the lack or overabundance of physical exercise, may cause insomnia. Some drugs, of which a notable example is benzedrin sulphate, easily upset the sleep habit. Insomnia is a frequent symptom in infectious diseases, acute or chronic. Obviously, the successful treatment of insomnia so produced depends on elimination of its toxic cause. While this is being accomplished, symptomatic treatment of the insomnia is often indicated. In this group of cases hydrotherapy holds a definite therapeutic place. The warm bath, starting the first night at 98 degrees and reducing a degree nightly to 90 degrees, is often very satisfactory. As the bath exerts its sedative and hypnotic effect through redistribution of the blood supply, it is essential that the patient be transferred from the bath to a warmed bed, and not allowed to become chilled in transit if good results are to be obtained. If a tub bath is not practicable, the bed pack may be given. Here, when the mattress is protected by rubber sheeting, the patient is wrapped in a sheet, wrung out in tap water, then in two layers of blankets. With the use of the tub or pack, cold compresses or an ice-bag to the head, may be used. Either tub or pack may be continued under supervision from thirty minutes to an hour or longer, depending on the patient's reaction.

Aside from hydrotherapy, the use of the milder hypnotics may be necessary. Many patients will sleep with the aid of bromid alone. The accumulative effect of this drug, as well as the marked individual variations in susceptibility to it, must always be borne in mind. Of the older drugs, chloral hydrate is of value. Paraldehyd is a relatively safe hypnotic and of special value in insomnia due to alcoholism. Its use is limited by its disagreeable taste and odor. There are at the present time a large number of barbiturate preparations on the market which, when used in moderation and under medical supervision, are satisfactory hypnotics for short periods. The possibility of a barbiturate habit must be guarded against. The scope of this discussion does not permit a detailed résumé of these preparations.

In the psychoses, insomnia is often an intractable and serious symptom. In this group, hydrotherapy is an extremely valuable therapeutic procedure. As most of these cases are under treatment, where the continuous bath is available, this should be first choice. The continuous bath is best given at body temperature, and it should never be given at more than one or two degrees above this. It should always be given under constant expert supervision, and any form of mechanical heat control of the water should be checked frequently by other means. The bed pack, given as previously described, is also of great value. Either continuous bath or pack may be continued for hours in suitable cases under strict observation. In severe excitements, hydrotherapy must often be combined with the use of sedatives and hypnotics. Here the barbiturate group alone, or combined with regular daily bromid administration, is of great value. Chloral alone, or combined with a barbiturate, is often satisfactory. Paraldehyd is especially valuable in the alcoholic psychoses. Finally, recourse may be had to hyoscin alone or combined with morphin in HMC's. The mode of administration depends on the patient's accessibility. Mouth and rectal administration may be tried. Recourse to the nasal tube or intramuscular injection is frequently necessary. Intravenous introduction need not be considered.

Insomnia is such a common symptom in functional nervous disorders that one rarely sees a

psychoneurotic who has not suffered from some degree of sleep disturbance at some time during illness. Here psychic causes are in the ascendancy, and successful therapy is dependent upon their elimination. Nervous insomnia is not simply a disturbance in sleeping, but a mental state colored colored by fear and anxiety in regard to not sleeping. Therapy should be primarily reëducational in type. Rationalization of the situation, combined with the correction of faulty habits of living, and especially of rest and relaxation, often suffices without medicinal aid. Hydrotherapy, especially the moderately warm bath previously described, is of definite value. Massage, preferably given shortly before bedtime, is helpful in a definite percentage of cases. The milder hypnotics are permissible only as an aid to psychotherapy and must be rigidly supervised and controlled. The habit of dependence on drugs is exceedingly easy for the psychoneurotic to acquire and frequently results in more harm than the sleep disturbance.

Principles in Procedures in Treating Syphilis:

1. Treatment of early syphilis should be continuous.

2. Spinal fluid examinations should be made routinely at the end of the first year of treatment and as indicated at any time.

3. Complete physical examinations with special attention to the cardiovascular and nervous systems, and including suitable laboratory tests, should be routinely made at least at the beginning of treatment.

4. Patients having suspicious lesions which are found to be darkfield negative, should be followed up by a series of serological tests at suitable intervals, and no local or constitutional treatment should be administered until the diagnosis has been established.

5. Minimum treatment required:

(*a*) To render patient noninfectious, twenty standard doses of an arsphenamin and twenty doses of bismuth administered by the continuous method of treatment.

(*b*) To "cure" the patient: One year of treatment after the patient has become and remained clinically and serologically negative (including spinal fluid).

6. All patients having syphilis should be examined for gonorrhea. All patients having gonorrhea should be examined for syphilis.

7. Epidemiological service by trained personnel should be adequately provided to supplement the efforts of the doctors in:

(*a*) Seeking to trace the sources of infection.

(*b*) Bringing in the contracts of patients for examination.

(*c*) Holding patients long enough under continuous and adequate treatment.

(*d*) Thorough personal instruction of patients to assure coöperation.

Management of Syphilis in Pregnancy and Congenital Syphilis

1. Every pregnant woman should have a medical examination as early as possible in pregnancy, this examination to include adequate history, clinical and serological examinations fo rsyphilis.

2. Every pregnant woman should have at least one complement-fixation test and one precipitation test for syphilis, and these tests should be reported when negative or doubtful, if there is any reason in the history or clinical findings to suspect syphilis.

3. Treatment of syphilis as a complication of pregnancy should start as soon as a diagnosis is made, should continue through pregnancy to delivery. Treatment should begin and end with the arsenical; if pushed for time, use combined treatment—bismuth with the arsenical.

4. A syphilitic woman should be treated in every pregnancy regardless of previous treatment, and regardless of negative serological findings. Even a few doses of arsphenamin late in pregnancy are better than no treatment at all.

5. Treatment should be continued after delivery for the benefit of the mother.

6. Every child of a syphilitic woman, and the woman's husband, should be examined for syphilis and treated, if indicated.

7. The child born of a syphilitic woman should not be treated "on suspicion," but only after a definite diagnosis has been made, and treatment should be started as soon as a diagnosis is made. The earlier a congenital syphilitic child is treated for syphilis the better, and the treatment must be prolonged.

8. The new-born child of a syphilitic woman, even though the mother has been treated, should be followed with frequent serological, clinical and x-ray examinations. This periodical supervision should extend, if possible, until the seventh year.

9. The stigmata of congenital syphilis should be kept in mind by all who examine children. When a suspicious defect is seen, a careful study, including blood, x-ray examination, and spinal fluid serology, should be made.

10. Even late congenital syphilis benefits by treatment in the vast majority of cases.

"The conception is sometimes held that when the signs of meningeal irritation are demonstrable, one can conclude that the patient is suffering from a meningococcus infection. Such deductions are often incorrectly drawn. Merely on the basis of probabilities, one would be more apt to be correct in diagnosing tuberculous meningitis than any other type of meningitis in a given case, since this is the most common cause of meningeal irritation, except in epidemics of meningococcus infections.

"Meningeal irritations may be caused by (*a*) bacteria of any kind, no matter how rare, but most often by staphylococci, streptococci, meningococci, tuberculosis or influenza bacilli, and mixed organisms, including the colon bacilli; (*b*) toxins produced by such organisms as B. tetanus, influenza, probably pneumococcus and B. tuberculosis; (*c*) viruses causing encephalitis, poliomyelitis, aseptic meningitis, idiopathic encephalitis, postvaccinal encephalitis, encephalitis associated with measles, chickenpox encephalitis and others of similar type; (*d*) occasionally, as the result of mechanical condition such as blocks and vessel thromboses, inflammation of adjacent cranial bones, subdural and spontaneous subarachnoid hemorrhages, more rarely as the result of edema, tumor, etc.; (*e*) occasionally, as a result of changes in the brain associated with lead poisoning, etc."—*Ohio Health News.*

Mechanism of Emotion.—Papez attempts to point out various anatomic structures and correlated physiologic symptoms which, taken as a whole, deal with the various phases of emotional dynamics, consciousness and related functions. It is proposed that the hypothalamus, the anterior thalamic nuclei, the gyrus cinguli, the hippocampus and their interconnections constitute a harmonious mechanism which may elaborate the functions of central emotion as well as participate in emotional expression. It is an attempt to allocate specific organic units to a larger organization dealing with a complex regulatory process. The evidence presented is mostly concordant and suggestive of such a mechanism as a unit within the larger architectural mosaic of the brain. The structures described here are usually represented as dealing with some phase of the olfactory function. There is no clinical or other evidence to support this view. Emotion is such an important function that its mechanism, whatever it is, should be placed on a structural basis. The organization presented here meets adequately the physiologic requirements proposed by Cannon and Bard with respect to the theory of emotion based on diencephalic-cortical processes. It is also in agreement with the observations of Dandy that the seat of consciousness is located somewhere near the midline, between the limits set by the corpus callosum and the basal structures of the brain.—*Archives of Neurology and Psychiatry.*

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section on pages 2, 4 and 6.

OFFICIAL BUSINESS

1. *Council Minutes, Two Hundred Fifty-ninth Meeting, January 15, 1938.*

COUNCIL MINUTES

Minutes of the Two Hundred and Fifty-Ninth Meeting of the Council of the California Medical Association*

Held in the auditorium of the Los Angeles County Medical Association Building, 1925 Wilshire Boulevard, Los Angeles, Saturday, January 15, 1938, at 9 a. m.

1. **Call to Order.**—The meeting was called to order by the chairman, Morton R. Gibbons, with the following members present: President Howard Morrow, President-Elect William W. Roblee, Past President Edward M. Pallette, Speaker Lowell S. Goin, Chairman of the Council Morton R. Gibbons, Chairman of the Auditing Committee Karl L. Schaupp; Councilors Calvert L. Emmons, Carl R. Howson, Louis A. Packard, Axcel E. Anderson, Alfred L. Phillips, O. D. Hamlin, F. N. Scatena, Henry S. Rogers, Harry H. Wilson, C. O. Tanner, W. H. Kiger, J. B. Harris; Chairman of Public Relations Committee Charles A. Dukes, Secretary F. C. Warnshuis, Editor George H. Kress, General Counsel Hartley F. Peart and his associate, Mr. Howard Hassard. Present by invitation at the afternoon session: George G. Reinle, William Molony, Dewey Barnard, A. A. Morrison, and C. A. Smolt.

2. **Charters.**—It was moved by Henry Rogers, seconded by Alfred Phillips, that the Secretary be authorized to issue duplicate charters to those county societies who do not hold original charters in their possession; such charters to be labeled "duplicate" and to be dated as of the date of the organization of the county society if available, or as of the date of reorganization of the California Medical Association, 1902. Carried.

3. **Membership.**—The relation of members who have been granted special types of membership in county societies, *i. e.*, associate, retired, honorary, to the California Medical Association and the American Medical Association and the advisability of providing for a type of membership which would permit these members to retain their state and national affiliation was discussed.

It was moved by Alfred Phillips, seconded by William Kiger, that a committee of three be appointed by the Chairman to investigate the matter of membership and report with recommendations to the Executive Committee. Carried.

The Chairman appointed Doctors Goin, Howson, and Scatena as members of the committee.

4. **Delegates.**—The Secretary submitted a report on the delegates and alternates regularly elected to represent the California Medical Association at the American Medical Association meeting in San Francisco.

5. **Postgraduate Conferences.**—It was moved by Howard Morrow, seconded by Edward Pallette, that the chairman of the Committee on Postgraduate Instruction be allowed the necessary expense entailed by attendance at the Chicago Conference on Postgraduate Instruction, in the event of his attendance. Carried.

6. **Advertising.**—In accordance with action of the Executive Committee, the Secretary reported that he had conferred with the Los Angeles County Medical Association's executive secretary and it was agreed that he should ask the authority of the Council to make a combination rate for advertising in the JOURNAL and the Los Angeles County Medical Association Bulletin.

It was moved by Howard Morrow, seconded by Karl Schaupp, that a plan of a combination rate for advertising in the JOURNAL and the Los Angeles Bulletin under the conditions outlined by the Secretary be approved. Carried.

7. **Medical Licensure.**—In view of the pending meeting of the Council on Medical Education and Hospitals of the American Medical Association, the discussion of medical licensure was referred to the next meeting of the Council, when more information would be available.

8. **Reporting Service.**—It was moved by Charles Dukes, seconded by Junius Harris, that the services of Yates Reporting Service be secured for reporting the five meetings of the Pasadena session, in accordance with their proposal of December 30, 1937. Carried.

9. **Minutes.**—On motion of Alfred Phillips, seconded by Edward Pallette, the minutes of the two hundred and fifty-third meeting of the Executive Committee were approved.

On motion of Alfred Phillips, seconded by Edward Pallette, the minutes of the two hundred and fifty-seventh and two hundred and fifty-eighth meetings of the Council were approved.

10. **Insurance.**—It was moved by George Kress, seconded by Charles Dukes, that a committee, consisting of the Chairman of the Council, the Secretary, and the General Counsel, be instructed to investigate the status of a certain insurance company operating in California and report to the Executive Committee, which shall have the power to act. Carried.

11. **Financial Report.**—The Secretary presented, for the information of the Council, the annual report of the finances of the Association as compiled by Ernst & Ernst, certified public accountants. This will be published in the Pre-Convention Bulletin.

12. **Legal Counsel.**—It was moved by Edward Pallette, seconded by Karl L. Schaupp, that the Legal Counsel be authorized to render an opinion upon certain matters pertaining to medical education. Carried.

13. **Councilor Expense.**—It was moved by Charles Dukes, seconded by Howard Morrow, that the expense incurred by Lowell Goin, referee at the hearing of the San Diego County Society, be approved for payment by the California Medical Association. Carried.

14. **Cancer Studies.**—In accordance with the suggestion of the Cancer Commission, on motion of Charles Dukes, seconded by George Kress, the Council approved the donation of one copy of the Cancer Studies to all members of the graduating classes of the four medical schools in California and to the house staff members in the San Francisco, Alameda, and Los Angeles County Hospitals. Carried.

15. **Lay Speakers.**—It was moved by Charles Dukes, seconded by Axcel Anderson, that in lay talks on cancer by speakers of the Association, the educational campaign as carried on by the Women's Field Army in coöperation with the American Society for the Control of Cancer, be called to the attention of audiences. Carried.

* The minutes of the two hundred and fifty-eighth meeting of the Council of the California Medical Association were printed in the November, 1937, issue of CALIFORNIA AND WESTERN MEDICINE, page 336. Minutes in this series now printed are for the two hundred and fifty-ninth meeting.

16. **Department of Public Health.**—The attention of the Council was called to the work of the Department of Public Health as outlined in a report by Director of Public Health Walter M. Dickie, and on motion of George Kress, seconded by Howard Morrow, the report was ordered published. Carried.

17. **Legal Department.** — The General Counsel submitted progress reports on the case of the *People* vs. *Pacific Health Association,* stating that further arguments would be heard in June, and a case in Santa Clara County.

18. **Loans to County Societies.**—The Secretary read the following report of the Special Committee on Loans to County Societies:

Your Committee recommends that the loan be not granted for the following reasons:

1. It would be setting a precedent that might lead the Association into future difficulties. Our monetary assets are only sufficient for a reserve to be used as needed for special purposes. Examples are the recent medical-economic survey, the Basic Science Initiative, and the possibility that the malpractice insurance situation may become so unsatisfactory that the Association may find it necessary to organize a mutual company for the protection of its members. The reserve funds of the Association are now invested in securities bearing a moderate rate of interest that can be readily turned into cash if it is needed.

2. If a loan is granted to one county unit, similar requests from other county units would probably be received. Adequate security, ease of conversion, and other factors essential in a loan placed on a business basis would be difficult to obtain.

Respectfully submitted,

LOWELL S. GOIN, M.D. (Signed)
CHARLES A. DUKES, M.D. (Signed)
W. W. ROBLEE, M.D. (Signed)

On motion of William Roblee, seconded by Howard Morrow, the report was approved and the recommendations contained therein were declared to be the policy of the Association in regard to loans to county societies. Carried.

19. **Medical Licensure.**—Full discussion was had of the practice of certain county hospitals in allowing unlicensed individuals to serve as residents and in some cases accept patients outside of the hospitals.

It was moved by Harry Wilson, seconded by Charles Dukes, that the Secretary be instructed to write to Charles B. Pinkham, Secretary of the Board of Medical Examiners, and William R. Molony, President of the Board, and call their attention to the facts that have been presented to the Council wherein practitioners that are unlicensed are practicing in county hospitals.

A vote was taken on the motion. Ayes, 11; Noes, 4. Motion carried.

20. **County Hospitals.**—Henry Rogers presented the resolution of the Board of Supervisors for the government of the Sonoma County Hospital. Full discussion was had of the general question of county hospital government and the desirability of a nonpolitical institutions commission.

It was moved by Louis Packard, seconded by Axcel Anderson, that the Chairman appoint a committee to assemble facts concerning this county hospital situation, especially in regard to an Initiative regulating government of county hospitals, said committee to report to the Executive Committee at its meeting in February. Carried. (Committee—Doctors Packard, Anderson, and Emmons.)

21. **Orange County Hospital.**—It was moved by Junius B. Harris, seconded by Chester Tanner, that the resolution of the Orange County Society relating to sex crimes be referred to the California Crime Commission. Carried.

22. **Recess.**—At this point a recess of the Council was called for luncheon, to reconvene at 2 p. m.

23. **Call to Order.**—The meeting was called to order after the recess by Chairman Gibbons.

24. **Basic Science Act.**—George H. Kress, General Chairman of the Committee on the Basic Science Act, submitted a report for his committee together with tentative drafts of several basic science acts and legal points involved as set forth by the General Counsel.

It was moved by Charles Dukes, seconded by William Roblee, that the report be received and that the Association postpone the sponsoring of the Basic Science Initiative until the 1940 General Election, and that the committee be instructed to continue its studies.

A vote was taken on the motion. Ayes, 14; Noes, 4. Doctors Pallette, Kiger, Goin, and Wilson voted in the negative. Motion carried.

25. **Birth of a Baby.**—After viewing a portion of the picture "Birth of a Baby," and taking cognizance of the present sponsors of the film, on motion of Karl Schaupp, seconded by O. D. Hamlin, it was moved that the film be approved for presentation to lay audiences.

A vote was taken on the motion. Ayes, 11; Noes, 5. Motion carried.

26. **Medical Service.**—Doctor Smolt of Ventura presented plans being offered for medical service in Ventura County and stated that the county society also wished to offer a plan.

It was moved by Harry Wilson, seconded by Charles Dukes, that the Ventura County Medical Society plan for medical service be submitted to the Committee on Public Relations, which will hear representatives of the Ventura Society and report to the Executive Committee. Carried.

27. **Budget.**—The budget for Association income and expense for the year 1938-1939 was submitted by the Chairman of the Auditing Committee and on motion of Karl L. Schaupp, seconded by Lowell Goin, was approved for submission to the House of Delegates. Carried.

28. **Committee on Arrangements.**—It was moved by O. D. Hamlin, seconded by Karl Schaupp, that the nominees for the local Committee on Arrangements as submitted by the Los Angeles County Medical Association, be approved. Carried.

29. **Annual Session.**—The Secretary reported that the Committee on Scientific Work recommended that a general public meeting be held on Tuesday evening during the annual session at Pasadena and that the coöperation of the Los Angeles County Medical Association was being secured.

It was moved by Lowell Goin, seconded by Henry Rogers, that the following nonmembers of the Association be invited to participate in the annual session program in accordance with the request of section officers: Nina Simmonds, Ph.D., Mr. Cheney, chemist; Mr. Leonard, and Mr. Warner, radiological technician.

It was moved by Edward Pallette, seconded by O. D. Hamlin, that the Secretary be instructed to investigate the matter of purchase of new stereopticon lanterns and screens for use by scientific sections and report to the Executive Committee. Carried.

On motion of William Roblee, seconded by Howard Morrow, the invitation to Frank Hartman, M. D., of St. Louis, to be one of the guest speakers of the Association at Pasadena, was approved.

30. **Memberships.**—After presentation of requests from county societies and submission of full membership data, on motion of Edward Pallette, seconded by O. D. Hamlin, and carried, the following members were granted retired membership in the California Medical Association: Thomas Orbison, Los Angeles; Ernest W. Fleming, Los Angeles; Frank S. Dillingham, Los Angeles; E. L. Bennett, Fresno; Francis P. Elliott, San Diego; Ernest B. Porter, San Diego; Alfred Baker Spalding, San Francisco; and Caroline B. Palmer, San Francisco.

31. **Associated Hospital Service of Southern California.** — The Secretary reported that the plan of the Associated Hospital Service of Southern California had received the approval of the Los Angeles County Society and the Committee on Public Relations.

After discussion, it was moved by Edward Pallette, seconded by William Kiger, that the plan of organization of the Associated Hospital Service of Southern California be approved. Carried.

32. **Vote of Appreciation.**—A standing vote of thanks was tendered Dr. George H. Kress for the work he had done in connection with the publication of the "Report on Factual Data" of the California Medical-Economic Survey.

33. **Trustees Of The California Medical Association.** It was moved by Karl Schaupp, seconded by Edward Pallette, that the California Medical Association repay the $31,000 loan to the Trustees Of The California Medical Association. Carried.

34. **Malpractice Insurance.**—George G. Reinle, Chairman of the Committee on Medical Defense, outlined the changed status of medical defense which has developed during the past few years and through the decision of the

American Bar Association on corporate practice of law. The amendments to the by-laws and defense rules of the Medical Society of the State of California were brought to the attention of the Council. After briefly referring to the various types of liability insurance, Doctor Reinle requested Mr. Peart to present the question to the Council. Mr. Peart then read an extended report on malpractice insurance and made certain recommendations as to policy.

It was moved by George Kress, seconded by William Roblee, that the Committee on Medical Defense, in cooperation with the General Counsel, prepare basic policies for medical defense with such other recommendations as in their judgment are deemed advisable and present the report to the Executive Committee for transmission to the Council. Carried.

35. **Death of Emmet Rixford.** — It was moved by Charles Dukes, seconded by William Roblee, that a committee be appointed by the Chairman to draw up suitable resolutions on the death of Emmet Rixford and that the resolutions be spread on the minutes of this Association. Carried. (Committee—Doctors Hamlin, Toland, Dukes.)

36. **Woman's Auxiliary.**—It was moved by George Kress, seconded by Chester Tanner, that the Editor be authorized, when suitable material is presented, to publish a supplement to the JOURNAL for the Woman's Auxiliary of the California Medical Association. Carried.

37. **Disciplinary Procedure.**—After discussion, Lowell S. Goin was appointed to bring in amendments to the present by-laws covering disciplinary procedure.

38. **Intercoast Hospitalization Insurance Association.** On motion duly made, seconded and carried, the minutes of the two hundred and fifty-third meeting of the Executive Committee were reconsidered.

On motion duly made, seconded and carried, the action of the Executive Committee in regard to the Intercoast Hospitalization Insurance Association was ordered deleted from the minutes of the committee.

It was moved by Fred Scatena, seconded by Lowell Goin, that the present form of policy of the Intercoast Hospitalization Insurance Association be approved by the California Medical Association. Carried.

39. **Executive Minutes.**—On motion duly made, seconded and carried, the minutes of the two hundred and fifty-third meeting of the Executive Committee were approved as amended.

40. **Adjournment.**—There being no further business, the meeting adjourned at 4:45 p. m.

AMERICAN MEDICAL ASSOCIATION LOCAL COMMITTEE ON ARRANGEMENTS FOR SAN FRANCISCO SESSION JUNE 13–17, 1938

The Board of Trustees of the American Medical Association has appointed Dr. Howard Morrow of San Francisco as General Chairman of the Local Committee on Arrangements for the annual American Medical Association session that is to convene in San Francisco the week of June 13, 1938.

Doctor Morrow, under authority conferred, was empowered to appoint the necessary local committees. Attached is a list of Doctor Morrow's appointments.

Executive Board—Howard Morrow, chairman; Alanson Weeks, treasurer; Junius B. Harris, Sacramento; George A. Reinle, Oakland; J. C. Geiger; L. R. Chandler; F. C. Warnshuis, secretary.

Finance—Alanson Weeks (chairman), Langley Porter, W. P. Shepard, Charles A. Dukes, Chauncey D. Leake.

Hotel and Housing—F. C. Warnshuis.

Publicity—J. C. Geiger (chairman), E. M. Pallette, Karl S. Schaupp.

Entertainment—W. D. Horner (chairman), W. W. Washburn, Garnett Cheney, Everett Carlson, Stacy Mettier, Edwin Bruck, Philip Arnot.

Alumni and Fraternity Banquets—Rea Ashley (chairman), John Cline, William Donald of Berkeley, Joseph Crawford.

Women's Entertainment Committee—Mesdames George Becker, Chauncey Leake, Edward Morrissey, Lewis Morrison, Jesse Carr, Howard Fleming.

Opening General Session—William J. Kerr (chairman), LeRoy Briggs, Arthur H. Bloomfield, Morton Gibbons, H. C. Moffitt.

President's Reception and Ball—H. C. Shepardson (chairman), Hans Barkan, D. K. Pischel, Fred Reichert, Edmund Butler, George Rhodes, Philip Arnot, Robertson Ward, W. D. Horner, Howard Fleming, Wilbur F. Swett, Francis Smyth, Stacy Mettier, Edwin Bruck.

Printing and Badges—F. C. Warnshuis.

Women Physicians—Alice Maxwell (chairman), Dorothy W. Atkinson, Mary Mathes, Lois Broek Watson, Huldah Thelander, Alice Bepler.

Golf Committee—James Morgan (chairman), George McClure, Ernest Chipman, George Gray, W. G. Moore, Joseph McCool.

Hospitals and Clinics—W. E. Carter (chairman), C. A. Walker, Howard Johnson.

Transportation, Taxis, and Tours—Laurence R. Taussig (chairman), Carl Hoag, Harold Fletcher, George Becker.

Opening General Meeting Clergyman—Reverend Dutton, Unitarian.

Registrations and Information—S. P. Lucia (chairman), Richard Friedlander, Edgar Munter, L. H. Garland, N. N. Epstein, G. Dan Delprat.

Woman's Auxiliary.—Mrs. J. C. Geiger (chairman), Mrs. John Humber, Mrs. Hobart Rogers of Oakland.

Invited Guests Entertainment—Clarence Toland (chairman), George H. Kress, E. M. Pallette, Junius B. Harris, W. W. Roblee, John H. Graves.

Sections and Section Work—

(a) *Medicine*—Thomas Lennon (chairman), H. G. MacLean of Oakland, De Witt K. Burnham, Kenneth D. Gardner, Clayton Mote.

(b) *Surgery—General and Abdominal* — A. R. Kilgore (chairman), Edmund Butler, Robertson Ward, G. D. Delprat, H. Brody Stephens, Henry H. Searles, W. W. Washburn.

(c) *Obstetrics*—P. H. Arnot (chairman), A. M. Vollmer, C. A. De Puy, Karl Schaupp, T. Henshaw Kelly.

(d) *Ophthalmology* — Otto Barkan (chairman), F. C. Cordes, A. E. Edgerton, Wilbur Swett.

(e) *Laryngology, Otology, Rhinology* — R. C. Martin (chairman), Rea Ashley, Lewis Morrison, George McClure.

(f) *Pediatrics*—E. B. Shaw (chairman), George D. Lyman, Francis Scott Smyth.

(g) *Pharmacology and Therapeutics* — Chauncey D. Leake (chairman), P. J. Hanzlik, Maurice Tainter.

(h) *Pathology and Physiology*—A. M. Moody (chairman), J. L. Carr, J. F. Rinehart, William Doek, P. Michael of Oakland.

(i) *Nervous and Mental Diseases*—Edward W. Twitchell (chairman), George Johnson, P. A. Gliebe.

(j) *Dermatology and Syphilology* — John M. Graves (chairman), C. J. Lunsford, F. G. Novy.

(k) *Preventive and Industrial Medicine and Public Health*—J. C. Geiger, Walter Dickie, Robert Legge.

(l) *Urology* — Clark M. Johnson (chairman), Sidney Olsen, Lloyd R. Reynolds.

(m) *Orthopedic Surgery*—H. H. Hitchcock (chairman), F. C. Bost, W. J. Cox, John Loutzenheiser.

(n) *Gastro-Enterology and Proctology* — Fred Kruse (chairman), Dudley Smith, Montague Woolf, Walter Boardman, M. F. Cunha, Edward Hanlon, J. W. Morgan.

(o) *Radiology*—H. E. Ruggles (chairman), R. R. Newell, I. S. Ingber, Carl Benson Bowen, Lloyd Bryan.

(p) *Technical Exhibits*—T. L. Althausen (chairman).

(q) *Scientific Exhibits* — Stanley Mentzer (chairman), Howard B. Dixon, C. Latimer Callander, Willard Kay, Ernest Gehrels.

*All articles listed under the caption, "This Month's Topics," have been written and sent to the Editor by the Association Secretary, Dr. Frederick C. Warnshuis.

ASSOCIATION NIGHTS

On January 4 President-Elect Roblee, Councilor Emmons, and the State Secretary attended a joint dinner meeting of the members of the San Bernardino-Riverside County Societies in San Bernardino. A splendid large and representative attendance of the members of these two fine, active societies was recorded. Commendable unity exists and wholesome influence is exerted in these two counties.

On the 5th, Speaker Goin joined these officers for a meeting of the members of Orange County in Santa Ana. Here, too, a fine turnout of members participated in the program. Orange County also reflects an alert, achieving membership.

On the 6th the party journeyed to El Centro, where that evening the members of the Imperial County Society turned out in goodly numbers for a dinner meeting. This is a 100 per cent county society and, while distant from larger metropolitan centers, these members are keenly alert and reflect commendable activity.

On the 7th the circuit ride was extended to San Diego, where at a dinner meeting that evening a large, gratifying number of the members in San Diego County were present.

At all of these "Association nights" the visiting officers present and discuss problems and questions that concern our Association, its members, and the public. Policies are outlined and relations are clarified. Each session is terminated by conducting a round-table of questions and answers.

These Association nights afford an opportunity for members to gain a clearer insight of our Association affairs and functionings, thereby making for better understanding. A better grasp is obtained upon questions that are vital to individual and organizational welfare. They are conducive to greater unity of purpose and support. The visiting officers also become informed upon local conditions and needs, which information is made available to our administrative bodies and committees.

The first councilor district is well organized, active, and composed of a splendid group of medical men.

MEDICAL SOCIETY OF THE STATE OF CALIFORNIA*

The Medical Society of the State of California is an *independent* organization composed of *members* of the California Medical Association.

Purpose

The purpose of the Society is to indemnify or reimburse its members for expenses incurred for the legal services of a *personal* or *private* attorney whenever a member is threatened or sued for alleged malpractice.

Membership Qualifications

A member in good standing in his county medical society may become a member of this *Society* by complying with the following conditions:

(*a*) Filing membership application with the Society's secretary.

(*b*) Holding a policy with an insurer authorized by law to issue physician's defense and indemnity policies and with coverage of at least $5,000.

(*c*) Payment of annual dues of $10.

Why You Should Be a Member

1. Membership means that you have the privilege of indemnification for the cost of your *personal* attorney in any claim or suit for malpractice brought against you.

2. In the event of a dispute with your insurance company (which in the past has not been an uncommon experience) your *personal* attorney will protect your interests and cause your insurance company to fulfill the terms of your policy.

3. Although your liability insurance policy provides you with the services of an attorney, that attorney, under the ethics and principles of his profession, *must represent your insurance carrier first* and hence his defense of you is directed to the fulfillment of his client's conception of its contract with you, and it is the company's interests which he must at all times protect.

4. A *personal* attorney provides for you a personalized supervision of and participation in, all legal problems and trial conduct, thus assuring full protection of your *personal* and professional interests.

5. This Society reimburses you or indemnifies you for expenses for the services of an attorney who will coöperate with your insurance company's attorney, thereby providing you with competent *personal* legal counsel.

6. Insurance companies operating in this field welcome the assistance your personal attorney can give them.

How to Join

1. Write to the Secretary, Medical Society of the State of California, Room 2004, 450 Sutter Street, San Francisco, California, for membership application blank.

2. Complete the application blank and send it to the Secretary with your check for $10 for your annual dues.

3. If your application is approved, a membership card will be sent to you.

You will then have adequate and necessary legal protection.

Board of Trustees

Morton R. Gibbons, San Francisco; George G. Reinle, Oakland; O. D. Hamlin, Oakland, Chairman; J. B. Harris, Sacramento, Vice-Chairman; Edward M. Pallette, Los Angeles; George H. Kress, Los Angeles; T. Henshaw Kelly, San Francisco.

Executive Committee

O. D. Hamlin, Chairman; F. C. Warnshuis, Secretary; J. B. Harris, Vice-Chairman; M. R. Gibbons.

PASSING COMMENTS

"The Editor's Easy Chair." Such is the heading of a section of some journals wherein editorial comment is recorded. Such a chair should be placed in the Smithsonian Institute for its rarity value. Many years of travel and inquiry have failed to produce such a piece of furniture for inspection, let alone use. The "Editor's Chair" is never an easy one, for if that officer is alert to his responsibilities and duties, it well-nigh becomes a seat of torture.

* * *

Are you joining with your fellow members in obtaining the personal benefits from the postgraduate conferences in your district? This opportunity should not be neglected.

* * *

Four months and then our annual session will convene in Pasadena. Decide to attend and write today for your hotel reservation to the manager of the Hotel Huntington.

* * *

The Society for the Protection of Medical Research is approved by our Association. Its purpose is to direct scientific research and to defeat the quests of those who seek to prevent animal experimentation by legislation.

* * *

The scientific program for our annual session in Pasadena May 9–12, has been completed and was approved at a meeting of all section officers in Santa Barbara on January 9. This program should prove to be of interest and value, and cause the Pasadena meeting to be most profitable to all who attend. The program will be announced in all details in the April issue.

* * *

Be sure to read the item on the Medical Society of the State of California published in this department. You do well to become affiliated.

* * *

The headquarters office of the Association belongs to all the members to which they can apply for information and assistance. It has no magic forces that can immediately solve all the problems of a member. However, material assistance is at your disposal whenever you feel the need of assistance. Be free to command it. Your inquiries are welcomed and will be accorded prompt answers.

* For the information of new members, the former name of the California Medical Association was "Medical Society of the State of California." With the consent of the Council, the organization here commented upon was permitted to use the former name of the State Association.—Ed.

COUNCIL, CALIFORNIA MEDICAL ASSOCIATION*

Front row (below): Morton R. Gibbons, San Francisco; William W. Roblee, Riverside; Howard Morrow, San Francisco; Oliver D. Hamlin, Oakland; Henry S. Rogers, Petaluma; Calvert L. Emmons, Ontario. *Second row:* Edward M. Pallette, Los Angeles; C. O. Tanner, San Diego; William H. Kiger, Los Angeles; Louis A. Packard, Bakersfield; Karl L. Schaupp, San Francisco. *Third row:* Frederick C. Warnshuis, San Francisco; Harry H. Wilson, Los Angeles; George H. Kress, Los Angeles; William R. Molony, Los Angeles; Clarence G. Toland, Los Angeles. *Fourth row:* Axcel E. Anderson, Fresno; Lowell S. Goin, Los Angeles; Alfred L. Phillips, Santa Cruz; George Reinle, Oakland; Carl R. Howson, Los Angeles; Charles A. Dukes, Oakland. *Fifth row (top):* Junius B. Harris, Sacramento; Hartley F. Peart, San Francisco; Mr. Hap. Hassard, San Francisco; Frederick N. Scatena, Sacramento.

When approached by agents to agree to render services at reduced fees, it is suggested that you pause and reflect before signing. In this connection read the resolution adopted by the San Mateo County Society and published in the Department of Public Relations in this issue.

Should you have signed such an agreement—shall we say inadvertently—you do well to cancel it at once. Never agree to be an underpaid, cut-rate employee of any corporation or company.

* * *

Applications for booth space for scientific exhibits at the Pasadena annual session will be reviewed and approved by the committee on February 23. Members desiring to present exhibits are requested to file their application with the State Secretary, accompanied by a brief description.

* * *

When engaging laboratory services, be sure that your consultant is a licensed physician specializing in radiology, pathology or bacteriology. "Licensed Physician," and not a "technician," for should you be involved in any action, your licensed physician becomes a competent expert, whereas the technician is extremely limited in his qualifications. You cannot afford to take the risk of referring patients to technicians for laboratory examinations.

* * *

Hospital insurance protection is now widely obtainable in California from organizations of approved standing. Urge your friends and employed groups to secure this protection. Hospital insurance at low premium rates will enable them to hurdle unpredictable hospital expenses. These policies are obtainable from three representative insurance organizations that confine their business to the writing of hospital insurance.

* Photograph was taken at the Council meeting held in Los Angeles on January 15, 1938, members standing on the steps of the west front of the Los Angeles County Medical Association Building. In addition to the councilors, others in the photograph are Doctors William R. Molony, Sr., George Reinle and Clarence Toland, and General Counsel Peart and Mr. H. Hassard.

The Council has deemed it inexpedient to attempt the passage of a Basic Science Law at the general election this November. This will be discussed at length in a future issue.

* * *

The following is taken from the January 15 issue of the *Journal of the American Medical Association.*

Don't Gamble with Gamble

Recently several physicians have paid $15 each for a listing of their names in an insurance medical directory; apparently they understood that they would be selected as medical examiners for certain insurance companies. This proposition was presented by one Mr. C. H. Gamble, representing the National Claims Statistical Bureau with offices in New York City and Atlanta, Georgia. In the event that one does not like the name of this organization, Mr. Gamble also represents the INsurOR INternationAL Association and the INsurOR Statistical Bureau, with offices reported to be in Washington, D. C., Chicago, Memphis, Oakland, California, and Dallas, Texas. Letters mailed to several of these addresses were returned marked "Name not in city directory." Inquiries sent to the Better Business Bureaus in these cities also failed to locate any such organizations. Although Mr. Gamble uses a number of addresses in a great many cities, evidently his office is "under his hat." Physicians throughout the length and breadth of the United States have been visited by Mr. Gamble. From South Carolina to California, from Illinois to Louisiana, from Florida, Texas and Arizona, have come complaints by physicians that the $15 paid out resulted in absolutely nothing—not even a press proof of their names. Apparently, Mr. Gamble has been too busy traveling to work up the rest of his business. Twice during 1937 THE JOURNAL published articles on insurance medical directories,1 pointing out the inadvisability of paying a fee for a listing in such directories. A resolution approved by the Judicial Council and adopted by the House of Delegates has condemned the listing of physicians in directories published by commercial concerns as unethical solicitation of patients. Officials of insurance companies have indicated clearly that commercial insurance medical directories are not used in the selection or appointment of physicians as examiners. Maybe some doctors have to pay for experiences of this kind, but reading THE JOURNAL is cheaper—and you get scientific articles also!

C. M. A. DEPARTMENT OF PUBLIC RELATIONS†

The Social Aspects of Heart Disease

In the past six months 275,000 United States citizens have succumbed to heart disease.

In order to live comfortably and happily with your heart it is necessary to know what it can do, and how you can keep it in a healthy condition. Also, to be on good terms with it you should know something of its language so you will know when it is time to give it a rest. The heart takes up its burden many months before birth and continues its rhythmic contractions for many years, more or less, depending upon how well it is treated.

The heart beats 60 to 80 times a minute, 100,000 times a day, 3,000,000 times per month, 36,500,000 times a year. During a life span of sixty years the average contracts 2,000,000,000 times, and the only rest it gets is between contractions; the faster it beats, the less time it has to rest and restore energy.

In general, it rests about nine hours out of the twenty-four. Perhaps we should take that as a clue to follow in providing rest for the whole body. Every twenty-four hours the heart performs work equivalent to lifting a one-ton elevator to the height of eight stories. If the capillaries in the body were laid end to end they would extend four times around the earth and would fall only a few thousand miles short of reaching half the distance to the moon.

Yet, through this amazingly complex and elastic system of pipe-lines the heart pumps blood continuously against a pressure sufficient to raise a column of mercury to the height of 120 millimeters. The heart forces approximately five quarts of the body's blood through this system about once a minute, but it has a capacity to speed up and is able to pump up to sixteen quarts a minute during violent physical exertion.

A drop of blood can make its round trip through the circulatory system in twenty-two seconds. Each hour the heart swishes a barrel of blood through the body, seven and a half tons of blood a day. This appalling unceasing assignment of the human heart to work from long before birth to the instant of death is performed uncomplainingly and few of us are aware of its burden until we run upstairs too fast or until our physician wags his stethoscope at a mitral murmur.

San Mateo County Medical Society: Credit Bureau

If you fail to read this letter do not come to us in a few weeks with the remark, "I didn't know anything about it."

At the last meeting of the county medical society, a Medical Credit Bureau was established to operate through the office of the secretary. The object of this Credit Bureau is to obtain the names of chronic "dead-beats" who change from doctor to doctor, month in and month out, with the sole purpose of avoiding payment to anyone for the medical services variously rendered. A letter will be sent to you each month containing a list of names and addresses of such credit risks so that you may protect yourself and conduct business with these individuals either on a strictly cash basis or not at all. In order to make this possible, I am requesting each member of the Society to have their secretaries go through their files and make a notation of those patients, past or present, who are known "dead-beats." The success of this Credit Bureau depends entirely upon your coöperation. It can be of real service to you if you wish to make it so.

† The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. Charles A. Dukes of Oakland is the chairman, and Dr. F. C. Warnshuis is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. F. C. Warnshuis, Room 2004, Four Fifty Sutter Street, San Francisco.

The following motion was passed at the December, 1937, meeting:

"That the San Mateo County Medical Society be placed on record as unalterably opposed to fee splitting or reduction of fees or rebating of fees to the Industrial Accident Insurance Company, that a copy of this resolution be mailed to all members of the San Mateo County Medical Society and the National Automobile Insurance Company, and that any member accepting work from any insurance company entailing reductions of fees, splitting of fees or rebating of fees, be referred to the Committee on Ethics and Professional Conduct for such disciplinary action as the committee sees fit."

The necessity for this action grew out of the fact that certain members of this society and other societies have been approached by the National Automobile Insurance Company and asked to do work on a fee schedule less than the standard industrial fee schedule. In return a certain guarantee was supposed to be given. Please take note of the fact that any physician entering into such a contract with this or any other company is subject to disciplinary action (censure, suspension or expulsion from the Society).

Very sincerely yours,

(Signed): J. Garwood Bridgman, M.D.

Secretary.

Important

The antivivisectionist group is now waging a campaign to obtain the passage of an Initiative known as the "Dog Pound Initiative" at the November general election.

Should this Initiative pass, animal experimentation would be prohibited in this State and scientific research terminated.

Fortunately, there are those possessed of informed intelligence who recognize the value and need of scientific research through the means of controlled humane animal experimentation. They recognize the value of animal's contributions for the safeguarding of human lives and the prevention and treatment of disease.

This informed group opposes the campaign of the antivivisectionists. To make opposition effective for the defeat of this Initiative, they have organized the Society for the Protection of Medical Research. This society is endorsed by the California Medical Association, and its representations merit the support of everyone.

San Francisco, December 14, 1937.

Porter versus King County Medical Society Court Decision (58 Pac. (2nd) 367)

To the Secretary:—In reply to your inquiry of December 9, in regard to the above case, the essential facts are as follows:

It is a Washington case cited by the Supreme Court of that state. The decision was to the effect that the King County Medical Society acted within its powers in adopting a by-law calling for the expulsion of any member engaging in contract practice. The Washington court said that the constitution and by-laws of a medical society constitute a contract between the members of the society enforceable in the courts, if not immoral or contrary to public policy or the law of the land. All physicians who were members of the King County Medical Society were required to obey the by-laws of the society or subject themselves to the penalty of expulsion. The court stated that it was not material how selfish or unselfish the objects of the medical society may be. Whether the by-law relating to contract practice was just or reasonable or wise, was a question of policy which concerned only the medical society and its members.

The foregoing case is discussed in the *Journal of the American Medical Association* for April 3, 1937, at page 1211.

111 Sutter Street.

Very truly yours,

Hartley F. Peart.

COMPONENT COUNTY MEDICAL SOCIETIES

RIVERSIDE AND SAN BERNARDINO COUNTIES

A joint meeting of the Riverside and San Bernardino County Medical Societies was held at the California Hotel in San Bernardino on Tuesday, January 4. Dinner was served at 7 p. m.

The meeting was called to order by President Delbert B. Williams at eight o'clock. About seventy-five members and guests were present.

The applications for membership of Dr. Mildren Van Cleve of Redlands and Dr. Lowell L. Emmons of San Bernardino were favorably voted upon.

The speakers were then introduced in the following order: Calvert L. Emmons, District Councilor; W. W. Roblee, President-Elect of the California Medical Association; Frederick C. Warnshuis, Secretary-Treasurer of the California Medical Association.

Each speaker brought an important message to the societies.

Following a round-table discussion the meeting adjourned at ten o'clock. ARTHUR E. VARDEN, *Secretary.*

SACRAMENTO COUNTY

The following officers have been elected to serve the Sacramento Society for Medical Improvement for the year 1938: Dave Dozier, president; W. J. Van Den Berg, vice-president; G. E. Millar, secretary. Board of Directors, Dave Dozier, W. J. Van Den Berg, M. Azevedo, Frank Lee, H. Schluter, Max Isoard, H. M. Kanner, Cordes Ankele, and E. S. Babcock. Delegates, F. MacDonald, Raymond Wallerius, and H. M. Kanner. Alternates, W. Pollock, Paul Guttman, and Ralph Teall.

The following committees were appointed:

Public Relations—W. J. Van Den Berg (chairman), Paul Christman, J. T. Vance, Hugh Carmichael, and J. Mullen.

Banquet Committee—E. S. Babcock (chairman), Wayne Pollock, and H. Saverien.

Program—Cordes Ankele, D. Saeltzer, and L. Ruddy.

Legislative Committee—F. N. Scatena (chairman), Max Isoard, and R. Soutar. G. E. MILLAR, *Secretary.*

SAN JOAQUIN COUNTY

The regular meeting of the San Joaquin County Medical Society was held in the Medico-Dental clubrooms, Stockton, on January 6, President John Blinn presiding. After the reading of the minutes Doctor Blinn installed the new officers for the year 1938 and turned the gavel over to the president-elect, Dr. A. C. Boehmer.

The petition of Doctor Schwing of Standard was acted on favorably and Doctor Schwing was declared a member. Petitions for affiliation to the San Joaquin County Medical Society were received from Doctors Julius Schreiber and Charles Martin, and these were referred to the Admissions Committee for investigation.

A letter from Doctor Anderson, Councilor for this district, was read and Doctor Van Meter made a motion, seconded by Dr. Dewey Powell, that the San Joaquin County Medical Society go on record as not at this time favoring the use of California Medical Association funds for attempting to secure signatures and pass the Basic Science Law, but that all the energies of the California Medical Association be directed against initiative measures which are threatened to be placed on the ballot against organized medicine. This motion was carried.

Dr. Dewey Powell read the following eulogy to the memory of Doctor Rixford of San Francisco.

"Last week-end the daily press brought us the sad news of the death of a great man, an outstanding member of the medical profession. Dr. Emmet Rixford of San Francisco had passed away in Peter Brent Brigham Hospital in the city of Boston. To all of us this news brought a keen sense of the great loss suffered by the medical profession, and to many of us it brought a keener sense of a personal loss of a revered teacher and a valued friend.

"Few men have been endowed with the great capacity and tremendous physique of Doctor Rixford. His seventy-three years were full of a great service rendered to the profession and to his fellow citizens. A remarkable surgeon, gifted with a sound sense of balance and good judgment together with unusual technical skill, he took great satisfaction in sharing his knowledge and tremendous experience with his many students, whom he loved to teach. He never ceased being a student himself, and his interest in and sponsorship of the Lane Medical Library is one of the most important reasons for the outstanding position of that library today.

"On numerous occasions throughout the years, Doctor Rixford has been the guest of this San Joaquin Medical Society, and the occasion of those visits stand out as important landmarks in our scientific programs. It seems, therefore, Mr. President, in view of the facts just recited, as well as the most important fact of all, that we are honored in having as one of our fellow members Doctor Rixford's son, Dr. Henry Rixford, that we should on this occasion pay a sincere and humble tribute to the memory of this great surgeon and teacher who has passed to his eternal reward.

"I would, therefore, move, Mr. President, that the secretary of this society convey to our fellow member, Dr. Henry Rixford, our sincere sympathy in the passing of his father, and that when this meeting adjourns that we do so by standing in silence, facing the west, for one minute in honor of our departed friend."

This motion was seconded by Doctor McGurk, and the motion was carried.

Dr. C. A. Broaddus announced that the final meeting of the Postgraduate Committee would be held on January 17 and that a dinner would be held at the Yosemite Club at 7 p. m.; and that there would be a clinic at the Medico-Dental Building, beginning at 5 p. m. on that same day. Dr. C. V. Thompson made a motion that the supper meetings be continued for the year 1938, these meetings to be on the same day and to precede the regular meetings. This motion was seconded by Doctor Blinn, and the motion was carried.

The paper of the evening was presented by Doctor Emge, professor of obstetrics and gynecology of Stanford University. The subject of his paper was *Cancer of the Female Genital Tract with Treatment.* This was illustrated with lantern slides and was very instructive.

There being no further business to come before the Society the meeting was adjourned at 10:30 p. m. in honor of Dr. E. Rixford. G. H. ROHRBACHER, *Secretary.*

SAN MATEO COUNTY

The meeting of the San Mateo County Medical Society was held in the banquet room of the Benjamin Franklin Hotel on Wednesday, December 22, 1937, and was called to order by President Frank Gregory.

A letter from the California Medical Association, concerning proposed revisions to the Federal Food and Drug Laws, was read and a petition, which had been prepared by order of the Board of Directors, was presented, approved, and signed by all members present. A copy of the petition is attached to the minutes.

The Secretary then read a letter from the San Joaquin County Medical Society, concerning fee splitting and fee reduction with industrial accident insurance companies. The following motion was made by the Secretary:

"That the San Mateo County Medical Society be placed on record as unalterably opposed to fee splitting or reduction of fees or rebating of fees to the Industrial Accident Insurance Company; that a copy of this resolution be mailed to all members of the San Mateo County Medical Society and the National Automobile Insurance Company; and that any member accepting work from any insurance company entailing reduction of fees, splitting of fees, or rebating of fees, be referred to the Committee on Ethics and Professional Conduct for such disciplinary action as the committee sees fit."

The above motion is a verbatim copy of that passed by the San Joaquin County Medical Society. The motion was seconded and unanimously passed.

The Secretary read a letter he had received from the California Medical Association, concerning the United Hospital Service of the Physicians' Life Insurance Com-

pany. It was emphasized that this organization was not authorized by the California Medical Association.

The Secretary announced that the Board of Directors had approved the establishing of a Medical Credit Bureau to operate through the office of the secretary of the Society, whose function it would be to send a letter to every member of the Society once a month, containing names of patients who are known to one or more members of the Society as definite credit risks. This recommendation, on the part of the Board of Directors, was unanimously approved.

Announcements were made of the following new members: Doctors Meyerfeld, Richards, Eliason, and Hanson. Doctors Eliason and Hanson, who were present, were introduced and given copies of the constitution of the San Mateo County Medical Society.

The Secretary announced that in the future if dinner reservations were definitely made and not canceled prior to the day of the meeting, and the member did not attend the meeting, he will be charged for the dinner, nevertheless.

The name of Dr. Gerald F. Fairbairn was read as a new applicant.

Dr. Kirk H. Prindle was next introduced, and he presented a very interesting case of hand injury followed by local and general septic infection with recovery. Following discussion of this case, a four-reel film, prepared by Davis and Geck, *Traumatic Surgery of the Extremities,* was shown. Following the showing of the film, an enlightening discussion was led by Doctors Prindle, Hoag, and Cleary.

The names of the following duly elected officers for the coming year were announced by the chairman: Hartzell H. Ray, president; N. D. Morrison, vice-president; J. G. Bridgman, secretary-treasurer. Board of Directors: Olin M. Holmes (1937-1939), Frank S. Gregory (1938-1940), Carl Benninghoven (1938-1940), Harvey H. Whitney 1938-1940), Robert F. Monteith (1938-1940).

J. G. Bridgman, *Secretary.*

SANTA BARBARA COUNTY

The annual banquet of the Santa Barbara County Medical Society was held on January 10, with our newly installed president, Dr. E. J. Lamb, presiding. Other officers installed at the meeting were: Dr. W. H. Johnston, president-elect; Dr. J. Jerome Rupp, secretary.

The retiring president, Dr. Irving Wills, received congratulations for his splendid record, and everyone (the incumbent not excepted) regretted that a change of residence necessitated Dr. William H. Eaton's resignation as secretary-treasurer, an office he has filled most faithfully for many years.

Brief talks were made by Mr. Patrick J. Maher, Mayor of Santa Barbara, Mr. Paul G. Sweetser, President of the Santa Barbara County Bar Association, and Assemblyman A. W. Robertson. Mr. Charles A. Storke offered free facilities of radio station KTMS for the dissemination of health information.

Dr. Eugene Kilgore of San Francisco was the speaker of the evening, and gave a most interesting and detailed exposition. He deplored the prospect of socialized medicine. He cited an alarming example of the ease of obtaining endorsements to a program detrimental to the endorsers and again brought to attention that the quality of medical care was as important as the distribution of that care and that State medicine would be controlled by a political group concerned mainly with distribution.

In the business meeting which followed, Doctors Arthur D. Bissell, James Dalton, and Sheldon Payne were elected members of the Society by unanimous vote.

Jerome Rupp, *Secretary.*

VENTURA COUNTY

The annual meeting and election of the Ventura County Medical Society was held at the Saticoy Country Club on December 14, 1937.

The following communications were read:

From the American Medical Association, Bureau of Medical Economics, requesting a fee schedule.

From Dr. Ray B. McCarty, calling attention of anyone interested in giving a surgical paper at the next meeting of the California Medical Association, and that they should present their requests to him.

From the State Secretary's office in regard to the Federal Food and Drug Laws; the Peter's resolution, and the letters from the State Secretary's office in regard to this resolution; also a letter from Dr. E. S. Kilgore in regard to the same resolution.

A copy of the resolution was passed by the San Joaquin County Medical Society at their last meeting.

Doctor Osborn made a motion, seconded by Doctor Manning, that the Ventura County Medical Society be placed on record as unalterably opposed to fee splitting, reduction of fees, or rebating of fees to the Industrial Accident Insurance Company, and that a copy of this motion be mailed to all members of the Ventura County Medical Society and the National Automobile Insurance Company, and that any member accepting work from any insurance company entailing reductions of fees, splitting of fees, or rebating of fees, be brought before the Society for such disciplinary action as the Society sees fit. The motion was unanimously carried.

Doctor Smolt made a motion, seconded by Dr. Sterling Clark, that the Peters resolution be tabled. The motion was carried.

Doctor Osborn made a motion, seconded by Doctor Homer, that the Secretary be instructed to communicate with our national senators and representatives and express a desire of this body for more stringent revision of the Pure Food and Drug Laws. The Secretary was instructed to arrange for a meeting with Doctor Udo Wile.

The following were unanimously elected to membership in the Society. Dr. G. H. Arnold, Moorpark; Dr. W. N. Nelson, Fillmore; and Dr. C. R. Wylie, Ventura.

Dr. F. H. Garrett of the Camarillo State Hospital, Camarillo, was unanimously accepted as a transfer from the San Bernardino County Medical Society.

A rough plan for prepaid medical care to groups under a common employer was presented by Doctors C. Smolt, S. Clark, and Morrison. After a prolonged discussion, Dr. Coffey made a motion, seconded by Doctor Osborn, that the Ventura County Medical Society go on record as favoring some such plan as presented, and that the present committee be regularly appointed to draw up a complete plan to be presented before the Society as soon as possible. The motion was carried. Doctor Osborn made a motion, seconded by Doctor Homer, that a vote of thanks be given to the present committee (Doctors Smolt, S. Clark, and Morrison) for the work they have done in outlining this plan. The motion was carried. Doctor Homer made a motion, seconded by Dr. G. Clark, that the committee be given power by the Society to contact the interested groups. The motion was carried.

The following members having no opposition, were unanimously elected to office for the coming year: G. C. Coffey of Ventura, president; W. F. Mosher of Ventura, vice-president; A. A. Morrison of Santa Paula, secretary-treasurer; A. A. Morrison, alternate.

A. A. Morrison, *Secretary.*

In Memoriam

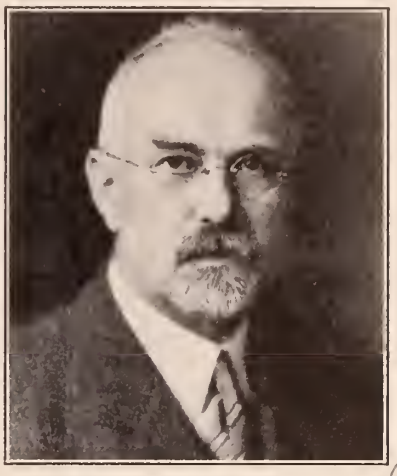
Gatchell, Willis LeForrest. Died at Stockton, December 31, 1937, age 83. Graduate of Bowdoin Medical School, Brunswick, Maine, 1882. Licensed in California in 1900. Doctor Gatchell was a retired member of the Butte County Medical Society, the California Medical Association, and the American Medical Association.

✝

Heffernan, William T. Died at San Diego, December 30, 1937, age 73. Graduate of the Medical College of Ohio, Cincinnati, 1889. Licensed in California in 1900. Doctor Heffernan was a member of the Imperial County Medical Society, the California Medical Association, and the American Medical Association.

✝

Howell, Edgar Henry. Died at San Francisco, December 30, 1937, age 54. Graduate of Hahnemann Medical College of the Pacific, San Francisco, 1907, and licensed in California the same year. Doctor Howell was a member of the San Francisco County Medical Society, the California Medical Association, and the American Medical Association.



✝

Rixford, Emmet. Died at Boston, Massachusetts, January 2, 1938, age 72. Graduate of Cooper Medical College, San Francisco, 1891. Licensed in California in 1892. Doctor Rixford was a member of the San Francisco County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✝

Seawell, James Walter. Died at Healdsburg, December 26, 1937, age 58. Graduate of the University of California Medical School, San Francisco, 1901, and licensed in California the same year. Doctor Seawell was a member of the Sonoma County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

OBITUARY

Emmet Rixford
1865–1938

The passing of Emmet Rixford at seventy-two years of age removes one of the great figures in the medical history of California and the West. He had been a tower of strength in the affairs of this Society, having served as its president in 1905 and again in 1924, a tribute to those innate qualities which won for him the respect and admiration of his associates. He continued in the service of the Society as a member of its Board of Directors to the very end.

As his father before him was a distinguished pioneer in the horticultural development of the State, so he early became a surgeon of distinction in the local profession and in the faculty of Cooper Medical College. At the incredibly young age of thirty-three, he was made professor of surgery, a position held by him for thirty-two years, when he was reluctantly retired to the emeritus group of Stanford University Medical School. His recognition and description of an unrecorded disease, coccidioidal granuloma, had been written two years earlier. By 1905, he had won nation-wide eminence and recognition as vice-president of the American Surgical Association, whose president he became in 1928.

In his home community he maintained an active interest in civic affairs, serving for many years as one of the governors of the Commonwealth Club. As the accompanying sketch of his life's story indicates, no matter what field of endeavor he entered, whether the practice of his profession, the exploration of mountainous wilds, the growing of beautiful roses, or the competition of yacht racing, his ability carried him to undisputed leadership. His courage proverbial, his composure under stress unequaled, his mind quick to grasp the new and worth while and able to retain it for instant use when necessary, all combined to make him a brilliant teacher, who profoundly influenced many generations of students, and a surgeon of accomplishment, whose service and advice were sought by layman and professional colleague from far and near.

In the grievous loss that this Society, this community, and this nation have sustained by the death of Emmet Rixford, it is fitting that we as fellow directors of the San Francisco County Medical Society place on record our sincere appreciation of his incomparable service to his fellow men, and our deep sense of personal loss at his passing, and that we direct the secretary of the Society to transmit a copy of these resolutions to his sorrowing family.

✝ ✝ ✝

WHEREAS, The Almighty Ruler of the Universe, in His Infinite Wisdom, has seen fit to remove from our number one whom we long loved and cherished—Dr. Emmet Rixford; and

WHEREAS, Through many years of professional and social acquaintance, we had learned to know him as one who exhibited the highest qualities of gentlemanly conduct, humanitarian spirit, and intelligent judgment; and

WHEREAS, His attitude toward his fellow practitioners in his chosen profession was ever courteous and helpful, especially to the younger man in medicine; and

WHEREAS, Through his long years of service as a teacher of the medical arts and sciences he had enlightened a large group of capable students who, inspired by his precept and example, have carried the lessons he taught throughout our state and nation; and

WHEREAS, His untimely passing has taken from us a kindly soul steeped in the love of his fellow man, ardently alive to the suffering of the sick, whose example has elevated the principles and practice of medicine in our community, be it

Resolved, That the California Medical Association, with heartfelt sorrow, record the death of this beloved friend and associate, whose kindly countenance and abundant wisdom have for so long graced and enlightened our meetings; and be it further

Resolved, That a copy of these resolutions be properly indited in the records of the California Medical Association, and that a copy of the same be transmitted by the secretary of our society to his bereaved family, with our deepest sympathy.

O. D. HAMLIN, M.D.
C. A. DUKES, M.D.
C. G. TOLAND, M. D.

* * *

Emmet Rixford, professor of surgery, emeritus, at Stanford University Medical School, one-time intimate associate of Dr. Levi Cooper Lane, died at the Peter Bent Brigham Hospital, Boston, January 2, of cardiac failure incident to an old coronary thrombosis, four days following an operation upon the bladder.

He was born in Bedford, Quebec, of American parents, who journeyed to California by way of Nicaragua in 1867, where the father became one of the State's distinguished pioneers, being directly responsible for the introduction of the Smyrna fig, and several hardy varieties of citrus fruits.

The son, Emmet, was graduated from the University of California in engineering in 1887, but was promptly diverted into medicine, taking his degree from Cooper Medical College in 1891. Together with Stanley Stillman, he became Dr. Levi Cooper Lane's assistant, later traveled as a graduate student in Eastern and European clinics, was named adjunct professor of surgery at Cooper Medical College in 1893, and professor of surgery in 1898. When Cooper Medical College was taken over in 1909 by Stanford University as its medical department, he continued as professor of surgery and chief surgeon on the Stanford service at the San Francisco County Hospital, where he served continuously as visiting surgeon for thirty-six years. His Thursday morning "colloquia" were attended by numerous surgeons, and many generations of students, who came to be instructed, as well as entertained, by this master of surgery. Resourceful and rapid in operating, quick and decisive in judgment, equipped with a mind abundantly laden with information at his immediate command, he made a brilliant teacher at the operating table.

His activity as an operator bridged the period between antiseptic and aseptic surgery, between drainage and non-drainage of wounds, but his facile mind quickly accepted and improved upon the rapidly advancing developments in surgery. He early insisted upon a bacteriologic and pathologic study of his operative specimens, and was himself an excellent surgical pathologist. He was one of the first on this coast to employ the x-ray and with it to locate accurately, because of his engineering training, a foreign body in the brain, permitting its successful removal by his associate, Dr. Stanley Stillman.

His engineering training made him particularly adept also in the understanding of fractures and dislocations, and a number of his papers dealt in original manner with the mechanics of the production and treatment of the green-stick, buckling, torsion, and flexion fractures. His first paper in 1894 dealt with the symptoms and diagnosis of tuberculous disease of the joints. Subsequent papers covered the gamut of general surgery: the treatment of hernia, of goiter, of pancreatitis, of renal calculus, of gallstones, of cancer in many sites; the rôle of industrial trauma in the development of cancer; the early history of the Pacific Coast medical schools and journals; and biographies of Cooper, Lane, and Huntington, pioneer master surgeons of California.

Quick to recognize in one of his early patients from the San Joaquin Valley that he was dealing with an unusual infection, he sent material to Professors Welch and Gilchrist of Johns Hopkins for further intensive study, which led subsequently to the recognition and description (by Rixford and Gilchrist in the first volume of the Johns Hopkins Hospital Reports, 1896) of a new disease, coccidioidal granuloma, also known as the San Joaquin Valley disease.

National recognition of his ability came early: vice-president of the American Surgical Association in 1905, he became its president in 1928; he was twice president of the San Francisco County Medical Society; a founder of the Pacific Coast Surgical Association, he became its president in 1932; long a member of the Society of Clinical Surgeons, he attended most of its meetings and accompanied its members on all but the last of its foreign tours. He held membership in the American College of Surgeons, in the Internationale Societé de Chirurgie, the California Academy of Medicine and the California Academy of Science. He helped organize the California Horticultural Society and was its vice-president during the past year. In 1928, at the request of Dr. Harvey Cushing, he served for three weeks as surgeon-in-chief *pro tem.*, of the Peter Bent Brigham Hospital in Boston, a significant honor shared on other occasions, among others, by such distinguished surgeons as Sir Charles Ballance, Professor Foerster of Breslau, Professor Gask of London, Professor Giertz of Stockholm, Professor Leriche of Strassburg, Sir D'Arcy Power of London, Professor Putti of Bologna, Sir Herbert Stiles and Sir David Wilkie of Edinburgh, Dean Lewis, Evarts Graham, Allen Whipple, and George Heuer of America.

A lifelong and paramount interest was the Lane Medical Library, whose completeness and present position as one of the great medical libraries of the country are entirely due to his efforts. It was he who prevailed upon his classmates in 1891 to purchase a two-volume atlas of skin lesions, which really formed the nucleus for the later development of the present library. It was he who journeyed to the Surgeon-General's library on several occasions, found duplicates of important volumes, and was permitted to box and send them to San Francisco. It was through his perspicacity and friendship with Doctor Jacobi of New York that he secured over 24,000 volumes of the early medical journals and greatly prized Paris theses which were found duplicated when the New York Academy and New York Hospital combined their libraries. The Lane Library, though named at his suggestion in honor of his chief, will be an enduring monument to his memory.

Although a distinguished scholar in his chosen field, Doctor Rixford's great charm lay in his extraordinary breadth of knowledge outside his professional calling. An authority on land snails, he possessed one of the most complete collections in California. His achievements as an indefatigable mountain climber are forever commemorated by the designation of a 13,000-foot peak in the Kearsarge Range of the Southern Sierra as Mount Rixford. His reputation as an authority on rose culture was nation-wide. As skipper on the Sloop *Annie*, brought around the Horn in the seventies, he won numerous races on San Francisco Bay, and was at one time designated Commodore of the Fleet. When *Annie's* day was finally done, she was reverently burnt at sea. When the earthquake and fire of 1906 rendered many homeless, he was made chairman of a relief fund to help destitute physicians. The Pacific Union, Bohemian, and Commonwealth Clubs of San Francisco claimed him as a member.

He is survived by his wife, Mrs. Louise Campbell Rixford; two sisters, Mrs. Geneve Rixford Sargeant, an artist, and Mrs. Caroline Byrd; a brother, Loring Pickering Rixford; a daughter, Mary Campbell; and three sons, Loring, Dr. Henry Covington Rixford, a surgeon of Stockton, California, and Dr. Emmet Lane Rixford, a surgeon in San Francisco.

His was an unusually active and useful life, full of zest for enjoyment, mingled with constant devoted service to his fellow men. No man, however poor, was ever denied the privilege of his skill. His service to the destitute sick of San Francisco is incalculable. When payment was possible, his requests were moderate. "No man whose life I have saved shall mortgage his remaining existence to me." He builded for himself an enviable monument of gratitude in the hearts of his fellow men. Many mourn his passing, few shall see his like again.

EMILE HOLMAN.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION†

MRS. HOBART ROGERS.....President
MRS. FRED ZUMWALT Chairman on Publicity

State Auxiliary Notices

Official Notice of State Board Meeting.—Mrs. Hobart Rogers, President of the Woman's Auxiliary to the California Medical Association, announces a meeting of the officers and Board of Directors to be held in Los Angeles on February 23, 1938. Official announcement will be received by members of that body through the mails.

Mrs. B. H. Sherman, 1622 North Fairfax Avenue, Hollywood, Chairman of the Library Board of the Woman's Auxiliary, will have received, when this notice goes to press, the designs for the Book Plate Contest, as all entries must have been in the mail on or before February 5. By the middle of March the judges will probably have made the awards and the names of the winners been known. As soon as they are sent in, the names will be published along with a description of their designs.

Component County Auxiliaries

Alameda County

On Friday, January 21, the Woman's Auxiliary to the Alameda County Medical Society will hold their first meeting of the year at the Claremont Country Club at twelve o'clock. Mrs. Thomas Clarke will be hostess for the informal reception preceding the luncheon. Mrs. Richard A. Young will be chairman of the day.

Honoring us will be Dr. Chauncey Leake, professor of pharmacology and materia medica at the University of California, who will address us on *Drug Foolishness.*

Mrs. Hobart Rogers, State President and a member of our Auxiliary, will also be an honored guest. Her subject will be *Your Auxiliary and Mine.*

MRS. GRANT ELLIS,
Chairman of Publicity.

Fresno County

On December 7, 1937, the Woman's Auxiliary to the Fresno County Medical Society was honored by a visit from the state president, Mrs. Hobart Rogers, and the corresponding secretary, Mrs. Charles Hall. Our business meeting was preceded by a delightful dinner at the California Hotel. The table, decorated by Mrs. B. F. Walker, was quite in the Christmas spirit. Along the table were red candles with the fruit of strawberry trees around them, and in the center of the table a round centerpiece of the fruit.

After the dinner there was a short business meeting. This was held in the lounge of The University-Sequoia Club. We then enjoyed a talk by Mrs. Rogers, delivered in her usual delightful manner, in which she spoke of the ideals and aims of the Auxiliary. Mrs. Hall also talked to us for a few minutes. The meeting then adjourned.

MRS. C. P. DOANE,
Chairman of Publicity.

Los Angeles County

Taking the place of the December luncheon meeting of the Woman's Auxiliary to the Los Angeles County Medical Association, a Christmas tea was given for the members on December 14 by Mrs. Eliot Alden, president, at her home, with members of the Board assisting.

Guests of honor were Mrs. Clifford Andrews Wright, President-Elect of the Woman's Auxiliary to the California Medical Association, and Mrs. James F. Percy, a past president of the Los Angeles County Auxiliary.

The Philanthropy Committee received at this time contributions for the Christmas baskets which were distributed to the families of needy doctors in Los Angeles County.

MRS. ROBERT L. CARROLL,
Corresponding Secretary.

Riverside County

The Woman's Auxiliary to the Riverside County Medical Society held an interesting meeting in December at the home of the president, Mrs. T. A. Card, on Aurora Drive.

The Auxiliary is trying to get a welfare footing, probably a reading and game room, in the poverty-stricken Mexican quarter, known as Casa Blanca. The Rev. Alec Trujillo, pastor of the Presbyterian Mission in this district, reviewed some of the social service needs. The principal of the school in this section outlined plans for a homemaking project which she hopes to establish, by means of which children of the school will prepare their own cafeteria lunch. Christmas songs by four Mexican girls completed the program.

About fifty members and guests were present for the social hour, during which refreshments were served. Assisting hostesses were Mesdames A. W. Miller and S. H. Keller.

MRS. H. J. WICKMAN,
Corresponding Secretary.

Sacramento County

An elaborate Christmas party was given the Woman's Auxiliary to the Sacramento Society for Medical Improvement by its Board of Directors in the home of Mrs. F. N. Scatena on Tuesday, December 21.

The evening was given over entirely to entertainment which included a musical program and a dramatic reading.

The Scatena home was beautifully decorated with Christmas trees, laurel wreaths, holly berries, and miniature Christmas scenes.

Some of the guests played bridge during the evening and prizes were distributed to the winners.

Gifts from a large Christmas tree closed the program for the evening, followed by refreshments.

Members of the Board of Directors are: Mesdames F. N. Scatena, Dave F. Dozier, William Van Den Berg, George Briggs, Orrin Cook, Leo Farrell, Hilding Johnson, Norris R. Jones, Frank Krull, Frank MacDonald, and James Yant.

MRS. H. CARMICHAEL,
Chairman of Publicity.

Santa Barbara County

The Santa Barbara County Woman's Auxiliary to the Santa Barbara County Medical Society was entertained at tea on the afternoon of November 23 by Mrs. Franklin R. Nuzum at her home in Montecito. This was the annual membership tea of the Auxiliary. The wives of all doctors and internes who are members of the county medical society were invited.

The Auxiliary held no December meeting.

MRS. H. E. HENDERSON,
Chairman of Publicity.

San Diego County

The Woman's Auxiliary to the San Diego County Medical Society met at the Men's University Club for its regular monthly luncheon on January 11.

Dr. James C. Anders, formerly a medical missionary in West Africa and head of one of the hospitals there, gave an interesting talk on *The Life and Customs of the Yoruba Tribe in West Africa.* His talk was illustrated by moving pictures which he had taken while residing in Africa.

Mrs. W. B. McGee gave a short review of an article from *Hygeia.* The very colorful decorations were provided by Mrs. E. H. Christopherson and Mrs. Otto Marsh.

† As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Fred Zumwalt, Chairman of the Publicity and Publications Committee, 3880 Clay Street, San Francisco. Brief reports of county auxiliary meetings will be welcomed by Mrs. Zumwalt and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue to Woman's Auxiliary notes.

San Francisco County

The first general meeting of 1938 will be held at the Auxiliary headquarters, 2180 Washington Street, on Tuesday, January 18, 1:30 p. m., with the president, Mrs. Hans Barkan, presiding. Dr. Mary H. Layman, a member of the Board of Directors of the Motion Picture Research Council, will address the members and guests on the *Effect of Motion Pictures on Children.*

The round-table discussions, under the leadership of Mrs. Julius Sherman, will continue during the spring on the first and third Mondays at 1:30 p. m. On Monday afternoon, January 3, the study group visited the Lane Library, founded by the late Dr. Emmet Rixford, to see the manuscripts of antiquity relating to the history of medicine.

Mrs. Howard B. Dixon, who was appointed by the president as the official representative of the Auxiliary to the Woman's Club House Association for the World's Fair of 1939, has been active in her duties attending committee meetings and arranging matters of interest for the Auxiliary. The clubhouse will be located on the fair grounds, and the members of the Auxiliary will be eligible to membership in the Association.

Responding to a request from the Parent-Teachers Association for a speaker from the Auxiliary, Mrs. A. S. Musante, a member of the Auxiliary Board of Directors, graciously addressed a large group at the General Pershing School on Tuesday, January 4, on the *Effect of Movies and Radios on Children.* Mrs. Musante is vice-president of the Motion Picture Council of San Francisco County.

Mrs. Harry R. Oliver,
Publicity Chairman.

Pasteurized Milk.—The term "pasteurization," or pasteurized, refers to the process of (1) heating every particle of milk to a temperature of not less than 142 degrees Fahrenheit, and (2) holding it at such temperature for not less than thirty minutes in (3) an approved pasteurization apparatus. (4) Approval shall be limited to an apparatus which requires a combined recording and indicating thermometer temperature tolerance of not more than 1½ degrees Fahrenheit, as shown by official tests, and (5) such apparatus shall be properly operated, and (6) the indicating and recording thermometer charts shall both indicate a temperature of not less than 143½ degrees Fahrenheit continuously throughout the period the milk is held.

The term "pasteurization or pasteurized" also includes the process of heating every particle of milk to 160 degrees Fahrenheit and holding at that temperature or above for not less than fifteen seconds in apparatus of approved design and properly operated. Cooling to a reasonably low temperature (50 degrees or less, and maintained at that temperature until delivery) immediately following the heating and holding, in order to prevent the growth of organisms surviving pasteurization.

Subjecting milk to the pasteurization process defined above will kill the bacilli of typhoid fever, the paratyphoid fevers, diphtheria, tuberculosis, and the dysenteries. It will also kill the streptococci of scarlet fever and septic sore throat, the micrococcus of undulant fever, the virus of foot and mouth disease, and all other nonspore-bearing organisms with which milk may be contaminated. The determination of the thermal death point of pathogenic organisms by various investigators, together with past experience with the use of properly pasteurized milk, indicates very clearly that the thermal death point of these organisms is relatively low and that they are readily destroyed by proper pasteurization. Pathogenic organisms are considered to be of great public health significance, since they cause human disease.

When considering what is the most economical and practical way of safeguarding a city's milk supply, pasteurization, properly accomplished, is the only solution. It is indeed a pity that milk, which is such an excellent food, can be such an extremely dangerous one if not properly safeguarded. Milk is not only a good food for human beings but also a good food for certain types of disease organisms. The necessity for pasteurization becomes increasingly apparent when we consider these possibilities of transmission of disease through the agency of milk. Milk may, upon occasion, without our knowledge, come from cows infected with tuberculosis or undulant fever. This source of danger may be minimized by elimination of the infected animals from the producing herds on the basis of tests devised for this purpose. One question must assail us, for how many months had the now eliminated cows been infected with these diseases before they were detected and slaughtered?

To build a hypothetical case: Assuming that the producing herd had been freed of infected cattle. This offers no protection against such diseases as typhoid fever, diphtheria, and septic sore throat, because the pathogenic organisms causing these diseases may come from infected water supplies or from human carriers of disease.

It is self-evident that pasteurization should not be used to conceal slovenly methods of milk production nor relied upon to take the place of efforts to produce a high quality of milk. It is equally evident that pasteurization cannot be blamed for the results of its improper use.

Pasteurization, properly accomplished, means that each step of the process described in defining pasteurization is actually observed. Many elements, such as faulty equipment, and careless operation, which ignores pasteurization principles, conspire to defeat this term. Pasteurization with adequate regulation, by means of an accepted ordinance plus uniform and efficient inspection by the personnel in the local city or county health department, makes possible a safeguarded milk supply.—*Ohio Health News.*

Facts About Pneumonia.—Of all acute diseases pneumonia is the most prevalent and fatal. As a cause of death in the United States it now exceeds tuberculosis. It occurs in all climates and is prevalent in tropical countries as well as in cold countries. It is more prevalent in the northern states of this country than in the southern states. Pneumonia shows a decided season of prevalence, as it occurs more frequently in the winter and spring months. It attacks individuals of all ages, but its incidence is most marked in infancy and in extreme old age. It occurs more frequently among males and is more highly fatal in negroes. When it attacks individuals who are physically strong, recovery generally occurs. In individuals who are physically weak and who are suffering from other disabilities, pneumonia is more often fatal. Ordinarily, pneumonia does not appear to be contagious. The pneumonococcus organism does not thrive outside of man.

While the disease sometimes occurs in epidemics, it ordinarily shows little tendency to develop in individuals who may come into contact with cases. Such outbreaks as have been recorded have occurred in institutions, camps, on shipboard, and in places where overcrowding may occur. Pneumonia is epidemic when influenza and measles are epidemic. It seems to thrive when the individuals' resistance becomes weakened through attacks of other infections. One attack does not confer immunity. In fact, increased susceptibility is more often the rule. The disease occurs often among alcoholics and develops frequently following exposure to cold and accidents. It is often found as a complication of whooping cough, typhoid fever, and other infections. Overexertion, fatigue, and exposure are often contributory factors in the development of pneumonia. Overcrowding, indiscretions in eating and drinking, and other factors that are commonly associated with the development of common colds are constructive factors in pneumonia.

While progress has been made in the prevention of pneumonia through the use of certain biologics, the best general methods of prevention lie in the avoidance of dissipation, poor or insufficient food, lack of exercise, loss of sleep, worry, overwork, alcohol, common colds, fatigue, and excesses of all kinds. Sleeping with open windows, living in rooms that are not overheated, breathing air that contains a sufficient amount of moisture, frequent baths of moderate or cold temperature, and the general observance of the laws of hygiene, are all important in the prevention of the disease. Individuals who suffer from minor infections should be properly safeguarded against pneumonia. Recovery should be complete before exposure to stresses and strains that might lower individual resistance. Advances are being made in the development of effective procedures against pneumonia, and it is possible that practical measures applicable to general use may soon become effective.

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association, San Francisco, June 13–17, 1938. Olin West, M.D., 535 North Dearborn Street, Chicago, Secretary.

California Medical Association, Hotel Huntington, Pasadena, May 9–12, 1938. F. C. Warnshuis, M.D., 450 Sutter Street, San Francisco, Secretary.

Thursday, February 17—KECA, 11:00 a. m., The Road to Health.
Saturday, February 19—KFI, 10:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, February 24—KECA, 11:00 a. m., The Road to Health.
Saturday, February 26—KFI, 10:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.

Resolution Against Special Contracts by Hospitals.—The following resolution was adopted by the Executive Committee of the Hospital Council of Southern California at a meeting held on January 11, 1938:

WHEREAS, Hospitals are constantly striving to balance budgets, and more often than not fail to balance their budgets;

WHEREAS, True costs studies show many published rates, particularly ward rates, less than cost;

WHEREAS, Insurance companies, corporations with medical departments, physicians doing group practice have asked or demanded special rates and in many cases succeeded in getting them;

WHEREAS, These rates are not founded on any social basis, but are preferential to those most able to pay full costs;

WHEREAS, Such policy of granting special rates to powerful companies has been thoroughly discredited, and branded as bad business ethics;

WHEREAS, Such policy not only is bad for hospitals, but also results in unfair competition in the profession of medicine also; be it therefore

Resolved, (*a*) That hospitals in this Council go on record as disapproving the practice of entering into special contracts at special rates.

(*b*) That hospitals in this Council recommend and urge all hospitals to grant no rates below their own published schedule, except to individual cases of merit, and to those patients after social service investigation proves such right.

(*c*) That a copy of this resolution be forwarded to the County Medical Association and to its members, assuring each high-class practicing physician that no secret agreements will place him at a disadvantage.

Associated Hospital Service of Southern California. The Associated Hospital Service of Southern California have opened offices at Room 528 Chamber of Commerce Building, 1151 South Broadway, Los Angeles, telephone Prospect 2579, and have entered into arrangements with Dr. L. B. Rogers, formerly superintendent of the Hollywood Hospital, to act as executive director of the new organization. Other officers are: R. E. Heerman, president; William H. Kiger, vice-president; Leonard K. Brown, secretary; Edward M. Pallette, treasurer. The hospitalization plan of the Associated Hospital Service of Southern California has been approved by the Los Angeles County Medical Association and is before the State Insurance Commissioner.

The following hospitals have become affiliated with the Associated Hospital Service of Southern California, as contracting hospitals, and have been inspected and certified by the State Department of Public Health: Alhambra Hospital, Alhambra; The California Hospital, Los Angeles; Cedars of Lebanon Hospital, Los Angeles; Foster Memorial Hospital, Ventura; Jared Sidney Torrance Memorial, Torrance; Las Campanas Hospital, Compton; Loma Linda Sanitarium and Hospital, Loma Linda; Long Beach Community Hospital; Mercy Hospital, San Diego; Methodist Hospital, Los Angeles; Mission Hospital, Huntington Park; Physicians and Surgeons', Glendale; Presbyterian Hospital, Olmsted Memorial, Lessee Hollywood Hospital; Riverside Community Hospital; San Pedro General Hospital; Santa Barbara Cottage Hospital; Santa Fe Hospital, Los Angeles; Santa Monica Hospital; Scripps Memorial Hospital, La Jolla; Seaside Memorial, Long Beach; St. John's Hospital, Oxnard; St. Joseph's Hospital, Orange; St. Luke's Hospital, Pasadena; White Memorial Hospital, Los Angeles; Hospital of the Good Samaritan, Los Angeles; Centinela Hospital, Inglewood.

Health Insurance Lecture Series.—Health insurance and medical sociology are to be made a special order of business by the University of California Medical School through a series of lectures dealing with many phases of these subjects.

The first lecture will come on February 2, when Dr. Paul Dodd will speak on the topic, "Cost of Medical Care." The other lecturers and lectures are as follows:

February 9, Dr. E. F. Penrose, Theory of Health Insurance; February 16, Dr. B. N. Armstrong, The Health Insurance Doctor in England, Denmark, and France; February 23, Dr. P. K. Brown, Health Insurance in the United States; March 2, Dr. A. H. Mowbray, Actuarial Principles of Insurance and Health Insurance; March 9, Dr. W. P. Shepard, the Physician's Place in the Community; March 16, Dr. H. A. Meyer, Health Insurance in Germany; March 23, Dr. J. B. Saunders, Health Insurance in Great Britain; March 30, Dr. T. H. Kelley, Organized Medicine and Health Insurance; April 6, Dr. E. S. Kilgore, The Relationship of Government to Medicine.

The lectures will be open to faculty, resident staff, medical students, members of the profession and all others interested, and attendance is expected from many parts of the State. They will be given in the auditorium of the University of California Extension Division at 540 Powell Street, San Francisco.

The series will be under the direction of Dr. Salvatore P. Lucia, and each lecture will be thrown open for free discussion at its conclusion.

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject) to CALIFORNIA AND WESTERN MEDICINE, 450 Sutter Street, San Francisco, for inclusion in this column.

The Work of the State University.—The University of California Extension Division exists for the purpose of distributing the benefits of education as widely as possible. It traces its origin to a series of lectures on the tragedies of Shakespeare, inaugurated by the late Professor Charles Mills Gayley on October 10, 1891, almost a half-century ago. These lectures and others offered subsequently were of such popularity that in 1913 it became necessary to organize a division of the University to administer them. Since then the public response to this opportunity for self-improvement has steadily increased. In the year 1935–1936, throughout the State there were 1,981 class courses with 41,047 enrollments. During the same year there were 2,939 enrollments for instruction by correspondence, 123,490 people attended special lectures sponsored by the Extension Division, and an aggregate audience of 1,226,000 people observed 12,263 motion picture or stereopticon programs supplied to schools, clubs, and study groups in various parts of the State.

As these statistics indicate, the University of California is a vastly different kind of institution from the old cloistered universities. It continues, however, to offer technical and specialized instruction as did universities of another day. During regular sessions on its seven campuses last year, 23,000 men and women were in residence, and more than 4,000 additional attended summer sessions. But public universities in a modern democracy must be more than centers of higher learning. They must be clearing houses where the knowledge of the world is brought to bear upon the problems of the commonwealth, and where the public can find technical assistance and intellectual leadership. The University of California bears these responsibilities. It sponsors investigations, and publishes its findings in scores of different fields, from agriculture to medicine and from history and government to mining and civil engineering. The courses announced in this booklet are a part of the public service of the University of California. They help men and women to gain more from life.—From the brochure, "Lifelong Learning," Berkeley, December 20, 1937, Vol. 7, No. 21.

Second National Social Hygiene Day.—*Social Hygiene News* of December 1, 1937, prints the following letter from President Ray Lyman Wilbur of Stanford University:

A Letter From the President

Dear Friends and Members of the American Social Hygiene Association:

Syphilis is in the headlines, on club programs, on the screen, on the air, on bookshelves, on the public mind!

What next? Will the nation merely talk and not act? Will nearly twenty million people continue to suffer with syphilis and its twin peril, gonorrhea, and threaten other millions? Shall ye keep on letting 500,000 new cases of syphilis appear each year? Thousands more to become needlessly blind or crippled? Taxpayers to bear the burden of caring for the 10 per cent of inmates of mental institutions who are there because of preventable end-results of syphilis? Shall sixty thousand syphilitic babies be born each year?

Not if the Association's Antisyphilis Committee can summon support needed to rally the nation against these vicious and expensive diseases. Experience in other countries shows that these maladies can be checked. American medical science is competent to do its part. Syphilis and gonorrhea can be conquered if—

1. Everybody learns how dangerous they are.
2. Those infected are taught to seek treatment early.
3. Proper treatment is assured for all who need it.
4. Health departments and coöperating agencies are furnished with enough money and personnel to do what is necessary.

Surgeon-General Parran looks to this Association to lead the way in "telling all the people." Its National Antisyphilis Committee, headed by General John J. Pershing, is charged with this duty and is raising $500,000 required by the Association. The Second National Social Hygiene Day, February 2, 1938, will draw attention to a most tragic aspect of syphilis—its attack on young men and women.

Will you help? Your membership dues, with any additional contribution you can spare, mean much. And as a citizen, you can hardly afford to be without the *Journal of Social Hygiene*, the *Social Hygiene News*, and other up-to-date publications. We count on you for 1938!

Sincerely yours,

Ray Lyman Wilbur, M.D.

President, American Social Hygiene Association.

Examinations: American Board of Obstetrics and Gynecology.—The general oral, clinical, and pathological examinations for all candidates (Groups A and B) will be conducted by the entire Board, meeting in San Francisco on June 13 and 14, 1938, immediately prior to the meeting of the American Medical Association.

Application for admission to the June, 1938, Group A examinations must be on an official application form and filed in the secretary's office before April 1, 1938.

The annual informal dinner and general meeting of the Board will be held at the Palace Hotel, San Francisco, on Wednesday evening, June 15, at seven o'clock. Dr. William D. Cutter, Secretary of the Council on Medical Education and Hospitals of the American Medical Association, will be the guest speaker, and the diplomates certified at the preceding days' examinations will be introduced individually. All diplomates are invited to attend the dinner meeting, and to bring as guests their wives and any persons interested in the work of the Board.

For further information and application blanks, address Dr. Paul Titus, Secretary, 1015 Highland Building, Pittsburgh, (6), Pennsylvania.

Publicity Materials for Social Hygiene Day.—The following item from the December 15, 1937, *Social Hygiene News* indicates how educational campaigns should be arranged:

"The Association staff has been busy for several months on the designing and production of new and arresting publicity materials for general as well as Social Hygiene Day use.

"Notable among these is a long-needed display for the general public. Included in this set are eight texts which are illustrated with drawings and photographs. The set is recommended for clinics and health centers and other places where large numbers of uninformed persons gather. The price will be about $1.50 per set, postpaid.

"An easel cut-out is being produced for use on drug-store counters. Local health department or social hygiene society leaflets should be placed with the cut-outs to give information concerning early diagnosis and treatment and where these may be obtained. The cut-out was made especially small and attractive so that a maximum number of druggists, who might object to large displays, will be anxious to use them. These will be about $5 a hundred, with your own imprint on large orders.

"By special arrangement with the publishers of Thomas Parran's 'Shadow on the Land,' a special educational edition is being provided through the Association. Made to sell for $1 each, they are available in quantity at $9 per dozen and $65 per hundred. The text is identical with that of the $2.50 edition.

"A Press Book will be included with the special kit which is being prepared. Included will be four suggested 'spot news' stories, two editorials, and ten three-minute radio talks. Twenty-five 'spot' announcements for radio will also be available.

"A Social Hygiene Day poster is being produced. The design will also be carried out in several sizes. A stereotype which can be inserted in the regular advertising of department stores, banks, and others will be provided on request.

"The Metropolitan Life Insurance Company offers splendid coöperation. A full-page advertisement will appear in all leading magazines for February. Also a large card, 'Protect Youth from Syphilis,' has been prepared and is offered for use in developing a store window display.

"The New York State Department of Health is offering its electrical transcriptions and may be able to release a new motion picture 'trailer' in time for general use on February 2.

"Look in the October *Journal of Social Hygiene* for recent bibliography.

"An appealing twenty-four-sheet outdoor billboard poster urging blood tests for expectant mothers is available for use in your community. Arrange for free space with your local outdoor advertising company. The Association can provide these posters at $1.50 each. Included, without extra cost, is a narrow strip announcing Social Hygiene Day to be pasted across the larger display. Hundreds of billboards will carry this poster during January."

Community Program for Combating Syphilis and Gonorrhea.*—Details of a modern program for combating syphilis and gonorrhea will differ from city to city in accordance with the size and character of each, but principles based on accepted facts should be identical wherever applied.

Briefly, a community program reduces itself to a few basic factors. These are education, case finding, and treatment.

Through education and various types of publicity, popular support can be rallied for the city's fight on syphilis and gonorrhea and the conditions which favor their spread.

Case finding receives impetus through well-directed publicity. Places for diagnosis and treatment should be made familiar to all, and adequate clinic facilities should be provided, including availability of free or inexpensive laboratory services.

The solution of the problem of treatment for the many neglected cases of syphilis is not in establishing more and larger clinics, but rather in coöperation with private practitioners and voluntary hospitals and clinics.

Departments of health may aid, however, by providing free drugs, free consultation regarding therapy, and the services of a public health nurse in the follow-up of lapsed cases.

Sources of funds for a city program are, first, the city budget; second, Security Act funds through state departments of health; and third, WPA funds through special projects.

Local voluntary agencies such as social hygiene societies can be of great practical assistance in many aspects of the program, especially with regard to popular education, professional training, and the creation of favorable public opinion.

Rabies Widely Prevalent Among Dogs: Cases Doubled in 1937.—More than two thousand rabid dogs have been reported in California during 1937, twice as many as have ever been reported during a single year in the history of the State. Most of these diseased animals have been discovered in Southern California, but recently more have been found in the central coast region and in the San Joaquin Valley. The Sacramento Valley is free of the disease, and only a few cases have been found in the region north of the bay of San Francisco.

At the request of local health officers the State has placed a quarantine on dogs and cats in Santa Clara and Ventura counties. Under the quarantine regulations all dogs and cats must be kept under confinement upon the private premises of the owners under restraint by leash or in closed cages or paddocks. It is the duty of peace officers and deputies of the county health officer to enforce the provisions of the order.

The great reservoir of rabies infection is in the stray dog population. If stray dogs were reduced to a minimum, rabies could be controlled easily. It would appear that the spread of the disease is from south to north, and it is probable that stray dogs are responsible for the spread. Communities in which stray dogs are impounded regularly and in routine manner have little to fear from rabies.

A veterinarian in Los Angeles County was recently bitten on the thumb by a dog that he had under treatment. It was not known until after the dog died that he suffered from rabies. In spite of the fact that the Pasteur treatment for the prevention of rabies was given to the patient, he developed the disease ten weeks after having been bitten and died. There is no history of any individual contracting rabies having recovered. The treatment is preventive only, and once the symptoms of the disease appear death is certain.

Children cannot be adequately protected against this highly fatal disease in those communities where no efforts are exerted to control stray dogs. When the disease is as prevalent as at the present time, it is important that community action be taken in the provision of adequate safeguards. The State Department of Public Health is ready to assist any community that may desire to take definite action in the control of the disease and in establishing preventive measures.

* Condensed from the article by Walter Clarke, M. D., Executive Director of The American Social Hygiene Association, in the March 6, 1937, *Journal of the American Medical Association.*

Botulism.—A fatal case of botulism was recorded in Los Angeles County, where a woman opened a jar of home-canned corn, tasted it without swallowing any, and threw the contents to the chickens. Ten chickens died the same day and five the next day, all having symptoms of limber neck. The woman was taken sick October 5, within thirty hours after tasting the corn, and died October 12.

Marriages Increase. — There were 48,305 marriages registered in California during the first nine months of the present year, as compared with 44,938 such events that were registered during the first nine months of 1936. This represents an increase of 7.5 per cent. The comparison of marriages by the months for the periods under discussion is as follows:

	1937	*1936*
January	4409	4201
February	4000	4058
March	4428	3959
April	4509	4516
May	4366	3870
June	8081	7263
July	6001	5733
August	6155	5406
September	6336	5932
Total	48,305	44,938

Lemon Juice.—Nearly half the samples of so-called pure lemon juice taken by food and drug inspectors and sent to the State Laboratory for analysis have been found to be adulterated with citric acid and water so as to cheapen the product.

Most of such lemon juice is sold to "on sale" places in unsealed bottles, making it sometimes difficult for the inspectors to ascertain whether the manufacturer or retailer is responsible for the adulteration.

One retailer and one manufacturer were cited for violation of the Pure Foods Act in that the product, labeled "100 per cent Pure Lemon Juice," contained one-half water and added citric acid.

The retailer claimed that he did not tamper with the bottle, and the manufacturer stated that it was made of pure lemon juice.

However, another sample of the manufacturer's product taken at a different place showed the identical analysis of that taken at the original retailer, which proved to our satisfaction that the manufacturer was responsible for the adulteration.

Ten Planks in a Platform.—The members of the Maternal Welfare Committee of the New York State Medical Society recently sat around a table in Rochester for their third annual meeting and drew up suggestions to help county medical societies in the state provide safe care for mothers.

The ten suggestions, as reported in the *State Journal of Medicine*, are as follows:

1. More emphasis should be placed on adequate rather than on minimum standards of prenatal care.
2. Greater attention should be given to eugenics rather than to birth control.
3. Every county medical society should include in its postgraduate instruction for doctors "refresher" courses in obstetrics.
4. The study of maternal deaths should be continued to determine preventability, with a committee meeting regularly.
5. A physicians' speakers' service should be organized for lay groups.
6. In each county of the state, a large public meeting should be held to bring to the attention of everyone the need for saving the lives of mothers and babies.
7. Greater emphasis should be placed on the value of a routine Wassermann test for syphilis for every prospective mother immediately after a diagnosis for pregnancy is made.
8. The coöperation of all interested agencies in the community should be enlisted.
9. The interest of women should be secured, particularly such groups as the Woman's Auxiliary of the County Medical Society.
10. The assistance of the Maternity Center Association should be sought.

National Tuberculosis Association. — Dr. Cameron St. C. Guild of the National Tuberculosis Association will be one of the visiting lecturers on public health at the University of California from January 16 to February 19. Doctor Guild, who is secretary of the Committee on Tuberculosis Among Negroes of the National Tuberculosis Association, will lecture on rural health administration.

Federal Grants Totaling $16,318,640 for Public Assistance in Eighteen States Announced.—The amount of the grant for each form of assistance, the total federal funds allotted and the estimated number of individuals being aided under the various California programs during January, are shown in the following table:

State	Aid to	Estimated Number of Recipients	Grant	Total Federal Funds Allotted to State
California	Aged	95,000	$4,894,975.55	$5,540,429.83
	Blind	5,300	261,088.98	
	Children	28,000	384,365.30	

Association of Western Hospitals' Twelfth Annual Convention.—A gathering of equal moment to medical men and hospital authorities alike will take place in San Francisco at the Fairmont Hotel on February 28 and March 1, 2, and 3. It will be the twelfth annual convention of the Association of Western Hospitals and the western conference of the Catholic Hospital Association, meeting jointlty. At least two thousand delegates are expected from all of the eleven western states.

Of prime interest to medical men will be the appearance of Dr. Malcolm T. MacEachern, head of the hospital section of the American College of Surgeons; Dr. J. C. Geiger, Health Officer of San Francisco; and other leaders of national, state, and county medical associations.

The outstanding theme of the conventions will be hospital costs, which certainly concern the doctor as closely as they do the hospital. Group hospitalization, the establishment of colonies for both alcoholics and epileptics, a cancer clinic, and the problems of hospital personnel, will be other outstanding topics.

Medical men generally are cordially and earnestly invited to attend the sessions of the convention, and particularly the showing of the exhibits of hospital appliances which this year promise to be greater than ever before.

This is the annual meeting of some 1,500 hospitals in the West to discuss their common problems and their common needs.

Faith in Radiation May Hinder Cancer Treatment.—Despite the great strides that have been made in treating cancer with irradiation, early diagnosis and prompt surgery are still the most effective weapons which medical science can employ in combating this disease.

This view was expressed recently by Dr. Frank Hinman, clinical professor of urology at the University of California Medical School, in pointing out that faith in the success of radium and x-ray treatment has led to many failures in the treatment of cancer and caused some physicians to lose sight of the value of early treatment and surgery.

Doctor Hinman pointed out that irradiation has replaced surgery in the treatment of certain forms of cancer. In these cases early diagnosis, which means recognizing the cancer before it has time to spread throughout the body, while extremely important, is not as essential as when surgery is required.

Nevertheless, with the exception of a few radio-curable cancers, mortality from this disease remains about as high as ever. Doctor Hinman attributes this to the fact that success with irradiation has lowered efficiency in dealing with radio-resistant forms of cancer. Early diagnosis is made no more frequently and acted upon less promptly than in the days before irradiation seized the medical fancy. These two factors, believes Doctor Hinman, explain many failures in cancer treatment.

Until the cause for cancer is determined and a specific cure found, he says, physicians should stick to the slogan, "Early diagnosis and prompt surgery." — *University of California Bulletin,* January 4, 1938.

Know the Truth—Save Our Youth.—The American Social Hygiene Association, of which Dr. William F. Snow, one time Director of the California State Board of Public Health, is now the executive officer, recently printed the following:

"Of the half-million new cases of syphilis which come to physicians and clinics for treatment each year, one in five is found among youngsters under twenty years of age.

"More amazing, perhaps, is the fact that half of all new syphilis infections are contracted by individuals between twenty and thirty years of age. Yet this age group represents only one-sixth of the total population.

"Dr. Ray Lyman Wilbur, President of the American Social Hygiene Association, said recently: 'The real perils in America today are alcohol and gasoline on the highway and the gonococcus and spirochete in the byway,' and, he added, 'syphilis and gonorrhea are certainly among the greatest menaces to boys and girls.'

"Young people are learning the truth about these diseases and are accepting the challenge to fight these foes of health and happiness. Parents, youth leaders, social hygiene agencies, and health authorities see the tremendous opportunities, backed by an awakened public opinion, for successfully attacking the enemy."

Severe Heart Pain Due to Obesity in Many Cases.—Severe and sometimes disabling chest pains which resemble the symptoms of angina pectoris may be traced in many instances to the patient's excessively overweight condition, according to Dr. William J. Kerr, professor of medicine in the University of California Medical School.

Speaking before the eighth annual postgraduate symposium on heart disease held in San Francisco recently, Doctor Kerr revealed that the University Medical School has obtained excellent results in treating overweight sufferers from chest pain, breathlessness and low blood pressure.

The pain, similar to that of angina pectoris in this condition, is presumed to be due to an insufficient supply of oxygen to the muscles of the heart. Doctor Kerr believes, on the basis of personal observation of a large number of patients, that the chief and precipitating causes of the pain lie outside the heart itself. He lays the blame on conditions which prevent the heart from filling with an adequate amount of oxygen carrying blood. Extreme obesity, and resultant abnormal posture is one of these conditions, he says.

At the University Medical School, overweight patients have been put on a special diet designed to reduce the weight to normal, and properly fitted abdominal belts have been applied. Later, postural exercises have been prescribed. In every case in which this has been done, the attacks of pain have been relieved.

The reason for this cessation of pain cannot be listed categorically, according to Doctor Kerr. However, he believes that it is due to the restoration of the normal position and movements of the diaphragm, the change in pressure within the abdomen and chest, and the increased freedom of motion enjoyed by the chest in breathing. All these factors apparently combine to aid the heart in filling itself with an adequate supply of blood.

Press Clippings.—Some news items from the lay press follow:

New Method Found in Disease War

Infantile Paralysis Progress Reported at Stanford

One more step has been taken by science in the effort to prevent infantile paralysis by applying zinc sulphate to the olfactory nerve.

Two Stanford University scientists, Dr. E. W. Schultz and Bacteriologist L. P. Gebhardt, continuing their researches, have developed a means to apply the zinc sulphate by a convenient technique, using droppers instead of the difficult spraying method heretofore employed.

Doctor Schultz warned the development represented progress and not achievement of a goal. Further tests will be carried on with funds raised, in part, through President Roosevelt's annual birthday ball, January 30.—*San Francisco Examiner,* January 13, 1938.

Snake Bite

We have always had a high regard for the California Medical Association, but we confess that our enthusiasm has somewhat cooled. With an utter disregard for one of our cherished traditions, it has announced publicly and flagrantly that for snake bite while on vacation one should take no alcoholic stimulants whatever. We may as well have no snakes, no vacations, or nothin'. — *Clearwater Journal* (Hynes, California), December 9, 1937.

Dramatizing Health

Borrowing a leaf from the Chinese, American public health officials are striving more and more to keep people from getting sick, rather than treating them after they do. Both the San Francisco and the New York World Fairs will illustrate this trend most graphically. The whole field of disease will be dramatized at the health show featuring the New York Exposition.

Fair leaders have recognized that health is the most important topic in the world. They will present in striking form mankind's war on cancer, tuberculosis, heart disease, and half a hundred other major scourges. Science's strides in battling these death-dealing forces will be shown. Methods of research and experiment will be explained.

Visitors will be able to learn for themselves many simple steps which they themselves, as laymen, can use in combating the menaces.

A human figure eighteen feet high, the heart beats of which can be heard all over the building, will feature one display. This transparent figure will be an object lesson in physiological perfection, to be used in conjunction with the other displays.

This idea of familiarizing the public with the fundamentals of health undoubtedly will spread. Dramatization of the problem will make the ultimate conquest of disease easier.—Editorial, *Los Angeles Times*, January, 10, 1938.

United States Medical Group Seeking Free Aid for Nation's Poor

Chicago, Jan. 12.—(INS)—Plans to provide adequate free medical service for the poor throughout the United States were announced tonight by the American Medical Association.

An editorial in the Journal of the American Medical Association said that "an attempt will be made to apply on a nation-wide scale the best features of the plans already in effect, utilizing in each county the fullest extent of the services there available."

The new program is to provide under the leadership of the county or other medical societies a medical service "for the indigent and those partially able to pay."

Collection Bureau: Orange County, California

(From Medical Economics, January, 1938)

To the Editors of Medical Economics:—An article published by Medical Economics [January issue, 1935, page 18] about a coöperative collection agency established by doctors in New Orleans caught the attention of a group of doctors here in Orange County, Cal.

In April, 1935, a committee appointed by the local medical association, organized and incorporated the Orange County Medical Bureau.. Each doctor who signed as a member was assessed $10. I was put in as manager with one girl as assistant. We opened an office, and the doctors sent in about 1,500 accounts as a starter. By May 15 we were off.

Four months later we had lifted ourselves out of the red. We have gone ahead consistently ever since. Our equipment is entirely paid for; we have no debts; our employees have increased from two to five; and everything looks promising for the future.

Thought you'd like to know.

Robert Speed, Manager
Orange County (Cal.)
Medical Bureau.

Harkness Makes $8,000,000 Gift

His Two Donations Go to Commonwealth Fund

Edward S. Harkness has made two gifts totaling $8,000,000 to the Commonwealth Fund, of which he is president, it is revealed in the 1937 report of the organization.

Although the donations were made primarily for general philanthropic purposes, temporarily the income from $3,000,000 will go toward the development of rural hospitals, and from the remaining $5,000,000 for medical research and education.

During the year ended in September, grants of about $1,800,000 were made from the current income, the report revealed.

The chief uses of this outlay were for the provision of country community hospitals, the encouragement of public health services in rural districts, the improvement of medical teaching, research, and professional education.

In all, 74 per cent of the fund's total appropriations for last year went for such projects.

The two latest donations of Mr. Harkness now bring the endowment of the fund, which was set up by Mrs. Stephen V. Harkness, to more than $50,000,000.—*New York Sun*, January 8, 1938.

Politicians on the Spot

Warners are at work upon another picture that will expose the nefarious doings of politicians. The new one will be called "County Hospital," and will show how the politicians bring about deplorable conditions in the public institution. No cast has been chosen, as the story is only now in the first stages of preparation, but a big star cast is planned for the picture. The story is one inspired by recent local headlines. — *Hollywood Citizen-News*, December 23, 1937.

Nation-Wide Paralysis Group Forms

Drive for Founders of New United States Foundation Will Open January 17; Members, Funds Sought

New York, Jan. 9. — (INS) — Marking America's first nation-wide fight against the "maiming death," a drive for founders of the new National Foundation for Infantile Paralysis will be launched January 17, it was disclosed tonight.

The drive will augment the thousands of celebrations Saturday, January 29, in honor of the President's birthday, Chairman Keith Morgan of the Executive Committee announced.

Those who join the new permanent organization will be enrolled as "founders." Morgan said. Certificates will cost $1 each. The enrollment will continue from January 17 through Saturday, January 29.

President Roosevelt will be founder No. 1. While no goal has been set, the committee hopes to enroll at least two million.—*Los Angeles Examiner*, January 10, 1938.

Plan New University of Southern California Medical School

Alumni Asked to Aid Drive at Meet

Construction by the University of Southern California of a new modern medical school near the General Hospital. That is the aim today of Dr. Paul McKibben, dean of the medical school, and faculty members. The project has the support of Dr. R. B. von KleinSmid, president of the university.

Disclosure of the plan, as yet only in the stage of discussion, was made by Doctor McKibben at the annual dinner of the Medical Alumni Association of the University of Southern California in the Los Angeles County Medical Association.

Must Have New School

"We should have such a new building in keeping with the high standing of the medical school of the university." Doctor McKibben said. "And we want the alumni to help in realizing this dream."

A few minutes later Doctor von KleinSmid, in addressing the alumni on international conditions, prefaced his talk with the declaration:

"We must have a new medical building. We will have it."

Dean McKibben cited as an instance of the high standing of the scholarship of the medical school the fact that in recent years not a single graduate has failed in examinations before the State Board of Medical Examiners.

"We need the help of the alumni in our building program and to keep the school where it is—at the top," he added.

The banquet was one of the best attended in years. Dr. H. B. Tebbetts, president of the alumni, presided. In addition to Dean McKibben and Doctor von KleinSmid, addresses were made by Dr. Frank F. Barham, publisher of The Evening Herald and Express, an alumnus, class '05, and Dr. George Kress, president of the Los Angeles County Medical Association, who had long been associated with the medical school.

A reverent silence pervaded the room when Doctor Kress asked that a toast be drunk in honor of the founder of the school, Dr. Joseph Pomeroy Widney, physician, author, soldier, scholar, and statesman, who will celebrate his ninety-sixth birthday December 26.

"This grand old man is now blind, but his mind is still alive with the fire of his youth. He is still dictating books. Only last year his latest was published—not for profit, but for the benefit of mankind. Let us drink a toast in his honor."

Then Doctor Kress read the minutes of the first meeting of physicians who had gathered to organize the medical school way back in the early eighties. Included in the list were men who had become famous in the medical annals of California and also of the nation. Doctor Kress recounted that the first class to graduate numbered eight.

Doctor von KleinSmid spoke also on foreign affairs.

"We as a nation are the strongest in the world," Doctor von KleinSmid said. "We have 50 per cent of the currency wealth in the world. We are almost self-sufficient. We are no longer isolated, no matter how much we may wish to be."

For Anglo Alliance

An alliance between the United States and the English-speaking world is the hope for the preservation of democratic civilization, he asserted.

Election of officers of the Medical Alumni Association was a part of the evening's program. Dr. Harold R. Witherbee was elected president; Dr. Pierre Viole, vice-president; Dr. Anton Laubersheimer, secretary; and Dr. Alonzo Y. Olsen, treasurer.—*Los Angeles Herald-Express.*

Southern California Joins War on Infantile Paralysis

Southern California today was lined up to do its share in a nation-wide drive to raise $12,000,000 to fight infantile paralysis in 1938, following a luncheon yesterday of civic leaders, public officials, motion-picture executives and representatives of the clergy, at which hearty support was pledged to the movement.

Instead of confining the fund-raising to a general ball on January 29, birthday of President Roosevelt, as has been done in the past, efforts will be made to obtain small amounts from everyone interested in the humanitarian work, it was explained by Louis B. Mayer, principal speaker.

Each place where public dancing is conducted will be asked to donate 25 per cent of its receipts on the night of the 29th, emphasizing the slogan, "Dance with the President." A "parade of dimes" also will be sought from individual contributors.

"By these means we expect to increase the operating funds of the Warm Springs Foundation, now known as the National Infantile Foundation, from $1,000,000 to $12,000,000 annually," Mayer said.

A telegram was read from Joseph M. Schenck, regional chairman of the foundation, declaring that the nation looks to Southern California to point the way in the drive.

George Jessel, radio and screen comedian, was toastmaster. Others taking part or at the guest table included the following:

Dr. Harlan Shoemaker, Los Angeles, chairman of the drive; Justus Craemer, State Building and Loan Commissioner, who, representing Governor Merriam, declared the week of January 24 had been proclaimed "National Infantile Paralysis Week" for California; Monsignor Thomas O'Dwyer, representing Archbishop John J. Cantwell; Rabbi Edgar F. Magnin; Episcopal Bishop W. Bertrand Stevens, J. M. Ruben, Metro-Goldwyn-Mayer vice-president; Sheriff Eugene Biscailuz; Roy Becker, President of the Board of Education, who spoke for the full complement of board members present; Vierling Kersey, Superintendent of City Schools; County Supervisor Roger Jessup; City Health Officer Dr. George Parrish; Chief of Police James E. Davis; Walter J. Braunschweiger, Chamber of Commerce past president; and numerous campaign chairmen for Southern California counties.—*Los Angeles Herald-Express,* January 5, 1938.

Doctor Explains How He Restored Victim's Memory*

Miracle Man?

Dr. ———, Redwood City chiropractor, aided in restoring the memory of a man who says he is James Saunders of Ohio.

Although Dr. ———, Redwood City chiropractor, whose remarkable achievement in restoring the memory of Jimmy Saunders, amnesia victim, today, would deny he is a "miracle man," observers who watched the amazing results of the doctor's work held otherwise.

To Dr. ——— the task was simple. Each year, he said, he returns for summer work at the Palmer School of Chiropractry in Davenport, Iowa, where he keeps up on the latest developments in his profession.

He explained that all cases of loss of memory are due to spinal displacements which cause vertebrae to press upon the spinal cord.

In Saunders' case, Dr. ——— declared, the atlas bone, uppermost vertebra in the spinal column, was out of joint slightly forward and to the left.

This he detected by use of a newly developed instrument known as the "neurocalometer," which consists of a calibrated dial and an indicating needle. Pressed against the back along the spinal column, this instrument locates "hot spots," where nerves have been placed under a strain, the doctor stated.

X-rays taken also indicated the maladjustment.

To correct the trouble and bring back Saunders' memory, Dr. ——— merely "tapped" the misplaced bone back into its correct location, releasing the pressure on the spinal cord.

Such a maladjustment as that from which Saunders suffered may have been caused by an accident, jar, or even a strain, the doctor said.—*Redwood City Press.*

Pasadena Stray Dogs Face Death by Bullet*

Pasadena officials today put into effect a drastic dog-regulation ordinance which:

Gave police officers authority to shoot on sight any stray dog.

Forbade people walking their pets on the street even on leashes.

Permitted dogs to ride only in closed automobiles.

And fixed a penalty of $500 fine or six months in jail for any owner violating these mandates.

The ordinance was passed by the Board of City Directors after a stormy meeting as an anti-rabies measure.

Charges that "the rabies scare began with the reappointment of a city health officer in Los Angeles under whose former administration rabies scares were common" were contained in a letter of protest from Harold Weight of 110 North Mentor Avenue.—*Los Angeles Herald-Express.*

Daylight Ban Set on Dogs

But Pasadena Council Will Permit Owners to "Walk 'Em" at Night

Pasadena, Jan. 18.—Pasadenans may "walk their dogs" by moonlight or starlight, but it will continue to be illegal to exercise them by sunlight, the Board of City Directors decreed today.

Following a stormy and frequently amusing public meeting in the City Hall, the Directors unanimously gave first reading to an amended emergency rabies quarantine license. Effective tomorrow, the much-amended ordinance now gives dog owners the right to exercise their pets on leash between 7 p. m. and 7 a. m.

Beware of Crowds

But leashes must not be more than five feet in length, the dogs must not approach a crowd or come closer than five feet to any public buildings, especially markets, and must be kept out of all city parks.

The session was enlivened when G. L. Kelley of East Pasadena suggested that now that the Colorado Street bridge has been fenced on both sides to prevent suicides of humans, it would be a good idea to fence it at both ends for the benefit of dogs. It would solve the whole problem, he declared, if the bridge were completely enclosed to house this city's 5,000 canines.

"Seeing Eye" Problem

Although city officials previously decided to "wink" at possible infractions of the ordinance by owners of "seeing eye" dogs, the question again was raised by C. L. Lilley, spokesman for a dog owners' committee.

The prize letter read at the meeting was from Mrs. M. M. Hammond of Monrovia. "I certainly wouldn't like a member of the Pasadena board to bite my dog," read the letter in part.

Hilarious Side

That there is a serious as well as hilarious side to the rabies quarantine was disclosed by the report that Dr. Roger W. Barnes of 4804 Hillard Avenue, La Canada, has been forced to take a double Pasteur treatment after being bitten by a rabid chow dog last Sunday. At the time of the attack the Los Angeles physician assertedly was walk-

* This Redwood City press item was transmitted as an enclosure to the letter which follows:

Redwood City, California.

To the Editor of California and Western Medicine:—"Can any good thing come out of Nazareth?" Lest you may not have had the full account of the advances in scientific medicine as developed in our town of Redwood, I am enclosing a clipping from the local paper.

To have completed the cure, the cultists might well have manipulated the victim's "crazy bone"—but, possibly, he was not as crazy as appeared and, having had recognition or finding that his present condition was not better than when he left his home (he was in the county jail), he may have decided that he could venture back to sanity.

Yours truly,

———

* Editor's Note.—This series of items regarding rabies is printed to show the trend of lay opinion.

ing with his own great Dane and his small terrier. The chow, which later killed four other dogs, picked up Doctor Barnes's terrier and raced away with it.

The rabies situation as it affects Los Angeles County was clarified today by Dr. Wilton Halverson, city health officer. He explained that although he feels the problem ultimately must be solved by vaccination of every dog, there is a present necessity for rigid quarantine.—*Los Angeles Times*, January 19, 1938.

Pasadena Frees Dogs Twenty-Four Hours Daily

Pasadena dog owners, crowding into the chambers of the City Directors to protest the drastic anti-rabies ordinance which made their pets virtual prisoners, won a concession today when the directors amended the ordinance to allow dogs to be out twenty-four hours a day, provided they are kept on leashes not more than five feet in length.

The ordinance as first passed forbade dogs to be out at any time under any circumstances. The measure brought a storm of protest, and an amendment allowing the dogs out on leash between 7 p. m. and 7 a. m. was passed.

The protest continued until today's amendment was passed. It will be adopted formally by the board in its second reading Tuesday.

The amendment was passed after Attorney Rollin McNitt and Carleton Lilley, representing dog owners, spoke from the floor, advocating it. Upon its adoption the board asked all the forty spectators who were "satisfied" to rise, and attendants reported every man and woman stood up.

The amendment prohibits the dogs from being taken within five feet "of any public building, store, place of amusement or park where people congregate."

A mass meeting will be held in Altadena tomorrow evening, January 21, at 8 o'clock, in Elliott Junior High School on Lake Street, for the purpose of protesting the drastic dog ordinance in effect at Altadena, which is even more drastic than that in Pasadena. The meeting is being called by citizens of Altadena. Frank Foster Davis of Altadena is chairman of the committee for the mass meeting. Distinguished speakers will be present.—*Los Angeles Herald-Express*, January 20, 1938.

Pasadena Acts to End Rabies Scare

Pasadena, Jan. 20.—Alarmed at the prospective loss of Eastern winter tourists, Pasadena's Board of City Directors acted quickly yesterday to minimize the city's rabies scare.

Board members cast a first vote on an emergency amendment to the city's drastic dog-control ordinance, and if the amendment is adopted on second reading next Tuesday, Pasadena canines once more will be permitted on the streets if held on leashes.

Just as quickly, Pasadena health department officials thumbed through old records to show that the present wave of rabies is not serious after all. They pointed out that while the city scored thirty-five cases of proved rabies in 1937, as compared with thirteen cases each in 1935 and 1936, there have been far more severe "epidemics"—such as in 1931, with thirty-nine proved cases, and in 1928, with forty-one cases.

The present ordinance, which placed all Pasadena dogs under "shotgun quarantine"—to be shot dead if sighted on any street—brought a shout of protest from dog lovers, who declared that the quarantine would work such a hardship upon both pets and their owners that many dogs would have to be exterminated.

Frank Foster Davis of Altadena announced that he would hold a mass meeting in Elliott School Auditorium tonight to propose the drafting of a dog-on-leash quarantine similar to the Pasadena amendment.—*Los Angeles Examiner*, January 21, 1938.

California Social Welfare Department

Mrs. Splivalo Witness in Personnel Hearing

Dismissal of several employees of the State Social Welfare Department was urged by Governor Frank Merriam, according to testimony before the State Personnel Board during the hearing on the petition of Miss Kathleen McLaren, former employee of the department, who seeks reinstatement and payment of $200 a month back salary since December, 1934.

Called as a witness on behalf of Miss McLaren, Rheba Crawford Splivalo, Los Angeles Evangelist and former director of the State Social Welfare Department, said that, following Governor Merriam's election, her resignation was asked, that she resigned on December 13, 1934, that Mrs. Florence Turner was named as her successor the next day and that Miss McLaren and several other employees of the department were removed.

The Evangelist commended Miss McLaren as a capable and efficient worker, who had served the Welfare Department for three years and previously had been in the finance department.

Mrs. Florence Turner, also testifying, told the board that the governor had told her to clean out the department and that on January 18, 1935, she accompanied members of the Social Welfare Board to the governor and he again told them to fire several persons.

This afternoon the board took up recommendations of its executive officer for a general revision of the state civil service classification which would involve an additional expenditure of $760,000 annually in salaries to state employees. Half of this amount would go to employees now receiving less than $100 a month, Fred B. Wood, chairman of the board, stated.—*Los Angeles Examiner*, January 21, 1938.

Sinclair Lewis Here; Assails Propaganda

Lively as a cricket, a tall scholarly man with red hair skipped from subject to subject in conversation like a water bug across the surface of a pond.

It was novelist and Nobel prize winner Sinclair Lewis talking at the Biltmore Hotel after his arrival here from Chicago by Santa Fe train to lecture on "Propaganda and Poppycock" tomorrow night at the Shrine Auditorium.

"Everything but science, religion, and sex are standardized in America," said Lewis as he crossed his elegantly silk-sheathed ankles.

"This is the result of the mass thinking that is spread to millions through the radio, movies, and press.

"All that would be necessary for a dictator to end democracy would be to control the media that already are ending individuality in America.

"Since we are all coming to think and talk alike, all that is necessary is to get us to thinking a dictator would be a good idea." . . .

Skipping back to propaganda, Lewis said:

"These propaganda forces are standardizing American thought and may make the nation susceptible to anti-democratic forces, singularly enough, by using the very scientific marvels that pioneer American individuality and initiative produced. . . .

"The syndicated writers are among the most effective propagandists, for they influence millions of readers, and for that reason the quality of their writings ought to be increased tremendously." . . .—*Los Angeles Herald-Express*, January 19, 1938.

LETTERS

Concerning Woman's Auxiliary to the California Medical Association.

WOMAN'S AUXILIARY
TO THE
CALIFORNIA MEDICAL ASSOCIATION

Oakland, California,
January 20, 1938.

To the Editor:—May I take this opportunity to thank you so very much for the splendid editorial appearing in the January issue of CALIFORNIA AND WESTERN MEDICINE pertaining to the Woman's Auxiliary and our publication, *The Courier*. Nothing so spurs our membership on toward fulfilling aims and purposes of organization as an encouraging message from our parent body—the California Medical Association. Your editorial will indeed do this and will be an inspiration to all of us.

It is our aim to be informed and ready to aid in every way the cause of organized medicine, and thus justify our existence and your confidence in us as an Auxiliary.

1137 Mandana Boulevard.

Very truly yours,
MRS. HOBART ROGERS, *President*.

Concerning January editorial: Woman's Auxiliary to the California Medical Association.

WOMAN'S AUXILIARY
TO THE
CALIFORNIA MEDICAL ASSOCIATION

San Francisco,
January 22, 1938.

To the Editor:—May I take a moment of your time to tell you how very much I appreciate the very splendid

editorial that appeared in the January issue of California and Western Medicine regarding the Woman's Auxiliary to the California Medical Association. Your article will, I believe, bring about the desire and aim of those interested in that organization—a membership that will include every doctor's wife!

You mention a supplement to California and Western Medicine. In letters exchanged between the National Chairman of Publicity and myself, we have discussed at length that very point. Now that you have mentioned it and approved of it, something will probably be done. The Auxiliary will be grateful for the deep interest you have shown.

3880 Clay Street.

Very sincerely yours,
Mrs. Fred H. Zumwalt.

Concerning article on Medical Care in San Francisco.

To the Editor:—With reference to the story that appeared in the San Francisco *News* as to the so-called "Dodd Report of a Survey on Lack of Medical Care," may I state that the source of this interview and the reason therefor are as follows:

I was called on the telephone early in the morning by a special writer of the San Francisco *News* with reference to certain statements in which Doctor Dodd was quoted. I vehemently denied the lack of medical care in San Francisco as quoted by him. Likewise, I charged Doctor Dodd with a lack of any great amount of knowledge as to medical practice or medical problems here. I stated most sincerely (which, however, was not used) that the statements as to lack of public health training by the members of the State Board of Health were entirely incorrect, as these members knew more public health than many men who supposedly were trained in public health and consequently they did not need the training. . . .

Director of Public Health,
City and County of San Francisco.

Sincerely,
J. C. Geiger, M.D., *Director.*

Concerning the sixty-eighth annual meeting of the California State Dental Association, Stockton.

To the Editor:—We would like the members of the California Medical Association to know that the California State Dental Association is holding its annual meeting at Stockton, California, on April 4, 5, and 6, 1938.

We are having as guest speakers, C. Augustus de Vere of New York City; Thomas Mullen, M.D., Albert Davis, M.D., D.D.S., J. B. S. Saunders, M.D., all of San Francisco; and Hermann Becks M.D., D.D.S., University of California.

These clinicians, as well as work being done in public health matters, should be of interest. Admission by presentation of membership card of the California Medical Association.

1003 Medico-Dental Building,
Stockton.

Very truly yours
C. E. Stabler, D.D.S.,
General Chairman, California State Dental Convention.

Concerning donation to Lane Medical Library.

Stanford University School of Medicine
San Francisco, California,
December 22, 1937.

To the Secretary:—Thank you indeed for your letter of December 20 and the enclosed check for $119, which is the balance of the 1937 contribution from the California Medical Association to the Lane Medical Library. I have turned this check over to President Wilbur of Stanford University.

Once again I am pleased to acknowledge the receipt of such contributions and express our thanks and gratitude to the California Medical Association for this continued support. I hope you know how much good is done to members of the medical profession, not only in the Bay region but all over the State, by this support. It is wonderful and really rounds out our program and permits us to do a great deal of reference work and send books to doctors that otherwise we would be unable to do.

Very truly yours,
L. R. Chandler, M.D., *Dean.*

Concerning the American Physicians' Art Association Exhibition in San Francisco.

San Francisco,
January 2, 1938.

To the Editor:—Will you kindly run the following announcement in your valued journal so that doctor-artists may be made cognizant of this exhibition.

Respectfully yours,
F. H. Redewill, M.D.

Announcement

The American Physicians' Art Association, a national organization of medical men who have ability in the fine arts, will hold a first national exhibition in the San Francisco Museum of Art, San Francisco, California, in June, 1938. (The American Medical Association convention is June 13-17 in the same city.) The American Physicians' Art Association already has an outstanding membership. There are three classifications for membership: active, associate, and contributing. The first annual exhibition promises to be of unusual interest, with entries to be accepted (after jury selection) in the following classifications: oils, watercolors, sculpture, photography, pastels, etchings, crayon and pen and ink drawings (including cartoons), wood carvings, and book bindings. Scientific medical art work will not be accepted. The exhibition is not limited to first showings. All entries close April 1, 1938. Any physician interested should communicate at once with the Secretary of the American Physicians' Art Association, Suite 521-536 Flood Building, San Francisco.

Concerning Christmas Seal articles: Letter of Appreciation.

December 29, 1937.

To the Editor:—Thank you so much for sending us the copy of your magazine with its notice of our 1937 Christmas Seal sale. This contribution will be a great help to our campaign and we appreciate your splendid coöperation.

50 West Fiftieth Street,
New York City.

Cordially yours,
Elizabeth Cole,
Assistant Publicity Director.

Concerning the third annual Postgraduate Course, Portland, Oregon.

To the Editor:—We would like to call your attention to the third annual Postgraduate Course in Ophthalmology and Oto-Laryngology, which will be held in Portland, Oregon, April 3 to 9, 1938. This course is sponsored jointly by the Oregon Academy of Ophthalmology and Oto-Laryngology and the University of Oregon Medical School. The course is primarily intended for those in special practice.

Our guest teachers this year are Dr. A. C. Furstenberg and Dr. Sanford Gifford. The mornings will be dedicated to programmed papers by our guests. There will be a round-table luncheon each noon hour, with question box. The afternoon sessions will be held at the out-patient clinic of the Medical School, and in the evenings Dr. Olof Larsell, professor of anatomy at the school, will demonstrate the surgical anatomy of the head and neck. There are several other features in the formative stage which will be announced later in the preliminary program. Copies of this program may be secured by writing Dr. Paul Bailey, 929 Medical-Dental Building, Portland, Oregon.

Sincerely yours,
Paul Bailey, *Secretary.*

MEDICAL JURISPRUDENCE†

By Hartley F. Peart, Esq.
San Francisco

May a Physician Refuse to Give Expert Testimony Unless First Paid a Reasonable Compensation?

The Supreme Court of Kansas in a recent decision, *Swope* vs. *State*, 67 Pac. (2d) 416, has answered the above question in the negative. In that case a physician specializing in radiology, who had taken roentgenograms of the plaintiff's injured arm at the request of the defendant, Safeway Cab Transport and Storage Company, refused to testify on behalf of the plaintiff or to produce his roentgenograms unless paid the customary expert witness fee of $25. The Court directed him to take the witness-stand and he was asked to produce the roentgenograms. He refused, and likewise refused to testify unless first paid his fee. The Court thereupon found him guilty of contempt, fined him and ordered him committed to jail until the fine was paid. The physician then applied for a writ of habeas corpus, and when his application for the writ was denied he appealed to the Kansas Supreme Court. The Court's opinion is summarized as follows in the *Journal of the American Medical Association*, issue of December 25, 1937, at page 2166:

The question, said the Supreme Court, whether an expert witness may be compelled to testify if special compensation has not been paid him, has been considered in many cases. In some of the states there are statutory provisions which permit the trial court to fix such compensation. There is no such statute in Kansas. The general rule as to compelling an expert witness to testify is stated in 70 C. J. 75, as follows:

"The more general rule is that, apart from statute, an expert witness may be compelled to testify as to matters of a professional opinion, or matters to which he has gained a special knowledge by reason of his professional training or experience, without any compensation other than the fee of an ordinary witness, and his refusal to testify unless paid an extra compensation may be punished as contempt."

The present case, the court said, does not present a situation where the witness, at the suggestion of the party calling him, did anything by way of preparation to testify, neither does it present any situation where there was any attempt to compel him by any order of court to prepare himself to testify. The professional services of the witness were rendered at the request and cost of a person other than the one calling him to testify. It was contended that Doctor Swope refused to produce the roentgenograms which the subpoena had compelled him to bring because he anticipated that he would be asked to express his professional opinion based on them. Assuming that to be true, the court said, Doctor Swope was not warranted in refusing to produce the roentgenograms, nor would he have been warranted in refusing to answer questions based thereon.

There are experts of many kinds, professional as well as lay. Many men are experts in certain lines of endeavor. If physicians, dentists, lawyers, and engineers may refuse to testify concerning matters on which they may have opinions due to their respective trainings, simply because special fees have not been paid them, then a person qualifying as an expert shoe repairer may not be compelled to state what was the matter with shoes he repaired unless a special fee is paid him. It can readily be seen, the court said, that such a situation would be intolerable. It would tend to permit those who could afford it to produce witnesses whose testimony might be said to be expert and would prevent those without requisite means of the benefit of such testimony. We are not referring, the court said, to that class of cases where special preparation is required as a condition precedent to testifying, but to those where the witness is interrogated as to facts and opinions which he knows and has without such special preparation. In the absence of a statute authorizing the trial court to fix expert witness fees, or permitting the witness to refuse to testify until a stipulated fee has been paid, the court was not disposed to hold that a witness claiming to be an expert called on to give expert testimony may refuse to testify unless his demands have been met.

The court concluded, therefore, that the witness was not justified in his refusal to produce the roentgenograms and to testify, and the judgment of the trial court denying the application for a writ of habeas corpus was affirmed.

On one point, viz., the matter of forcing a radiologist to produce his roentgenograms in court by means of a subpoena, the Kansas decision is contrary to the Michigan case reviewed in California and Western Medicine, December, 1937, at page 432. The Michigan court held that the radiologist *owned* the x-ray negatives and, therefore, could *not* be forced to surrender possession of them. The Michigan decision represents the sounder logic and should have been followed in Kansas.

The decision of the Supreme Court of Kansas once again focuses attention upon the importance of securing legislation in California under which physicians would be protected in situations of the kind confronting the Kansas physician who refused to testify. The writer has long recognized the need for legislation along this line and, at the risk of repetition, quotes from his report on the State legislative session of 1937 addressed to the Council of the California Medical Association:

Bill Relating to Compensation for Expert Testimony (S. B. 446)

For several years last past individual members of the Association have been forced to render opinion evidence on behalf of a litigant in a legal proceeding and have not been able to secure any compensation other than the ordinary $2 witness fee for their services. This situation has been made possible by the fact that there is neither a statute nor judicial decision in this state requiring that a party to an action at law desiring opinion evidence of an expert must pay a reasonable fee for such professional services. In a number of states, courts have held that if a physician gives opinion evidence on behalf of a litigant without being first paid therefor, he cannot thereafter maintain an action to recover a fee for his services. In order that this rule might not become law in California, we prepared, after receiving authorization of the Council, a bill to be introduced in the legislature providing, in effect, that physicians (1) could not be required to give opinion evidence without first receiving a reasonable compensation therefor, and (2) if a physician did give opinion evidence without first being compensated therefor, he could later maintain an action to recover a reasonable fee for his services. The bill as drafted applied to all experts, including engineers, attorneys, dentists, criminologists, and many others, as well as physicians.

The bill was introduced by Senator McGovern as Senate Bill 446. It was not opposed in the legislature, and, due chiefly to the efforts of Senator McGovern and Doctor Harris, it was passed by both Houses, but through a misunderstanding it was not signed.

If a statute identical with or similar to Senate Bill 446, introduced by Senator McGovern at the 1937 session of the legislature, could be enacted, it would effectively prevent any possibility of the free use by litigants in civil cases of the personal knowledge of physicians and other experts.

† Editor's Note.—This department of California and Western Medicine, containing copy submitted by Hartley F. Peart, Esq., will contain excerpts from and syllabi of recent decisions and analyses of legal points and procedures of interest to the profession.

SPECIAL ARTICLES

CLINICAL LABORATORY LAW IS CONSTITUTIONAL*

The Attorney-General was asked for an opinion relative to the constitutionality of the new Clinical Laboratory Act, Chapter 804, Statutes of 1937, which is, in effect, a revision of the Clinical Laboratory Law of 1935 which he declared unconstitutional. In his opinion, the Attorney-General states that the 1937 Act is constitutional. The opinion reads:

To reach this conclusion, a review of the Act is required. The chapter referred to went into effect on the twenty-seventh day of August, 1937, and is operative as to clinical laboratory technologists and technicians who are granted certificates without examination because of time spent in actively doing the work required by Sections 3 and 4 for the period prescribed for securing the respective licenses. The penal provisions of the Act, however, are not effective until January 1, 1938. Thereafter, according to Section 1, no person, firm, association or corporation may conduct, maintain or operate a clinical laboratory as defined in said Act unless such laboratory be under the immediate supervision and direction of a licensed clinical laboratory technologist or a person holding a valid and unrevoked phy-

* This opinion supersedes that presented in the article "Information Concerning New Laboratory Law," printed in California and Western Medicine, January, 1938, on page 67.

sician's and surgeon's certificate issued under the provisions of the State Medical Practice Act of this State; thereafter, according to the same section, no person may lawfully make any test or examination requiring the application of the fundamental sciences, such as bacteriology, biochemistry, serology or parasitology, unless said person possesses an unrevoked certificate issued by the State Board of Public Health as a qualified technician in the subject or subjects concerned with the test or examination, or possesses an unrevoked certificate as a clinical laboratory technologist, or is the holder of a valid and unrevoked physician's and surgeon's certificate, issued under the provisions of the State Medical Practice Act of this State.

Pursuant to the section above referred to, the State Board of Public Health has authority, by regulation, to provide for the exemption of one or more technicians in each laboratory, who shall be called apprentices.

Section 2 defines a clinical laboratory as follows:

"Any place, establishment, or institution organized and operated for the practical application of one or more of the fundamental sciences by the use of specialized apparatus, equipment, and methods for the purpose of obtaining scientific data which may be used as an aid to ascertain the presence, progress and source of disease."

Section 3 provides for the issuance of a certificate of licensure as clinical laboratory technologist to each person holding a degree in one or more of the fundamental sciences, issued by a *recognized* institution, who is found by the Board to be *properly qualified*, after written, oral or practical examination, conducted under such rules and regulations as the Board may from time to time promulgate. The section referred to does not define a recognized institution, and hence is so vague and uncertain that the portion thereof relating to the holding of a degree from a recognized institution is ineffectual for any purpose. The legislature has failed to prescribe what body must recognize the institution or upon what basis institutions should or should not be recognized. To read into the portion of said section referred to a requirement that such institution should be subject to recognition by the State Board of Public Health is not warranted by the context and would constitute at least quasi judicial legislation. On the other hand, principles of statutory construction do not permit an interpretation based upon a delegation of legislative authority unless the legislature prescribes that an administrative tribunal may adopt rules or regulations relating to technical, health or medical subjects, and leaves the enforcement thereof to technical or trained boards or persons. In no instance is there any reported case indicating that such delegation is proper where a method for measurement is not supplied in the legislation for the administrative officer or tribunal.

It is the view of this office, however, that the legislature did not intend that the entire Act fall because of its use of the ineffectual expression "recognized institution," but rather meant the Act to stand, provided persons could be found who were properly qualified to secure a certificate of licensure, after examination as clinical laboratory technologists. By eliminating the requirement for the holding of a degree in a recognized institution and permitting all applicants after the first day of January, 1938, to take examinations for certificate of licensure as clinical laboratory technologists, the Act practically in its entirety may be given effect. Elimination of the requirement as to the holding of a degree is permitted because of the legislative expression in Section 11 of said Act that should any portion of the Act be unconstitutional, it would have passed the remainder thereof irrespective of such unconstitutional features.

The latter part of Section 3 provides for the granting of licensure as clinical laboratory technologist without examination to those having the qualifications therein prescribed, who make application to the Board before January 1, 1938, and who pay the required fee. This so-called blanketing in of those persons practicing as clinical laboratory technologists is not subject to constitutional objection.

Section 4 is practically identical to Section 3, except that such section has no requirement concerning the length of time one must be engaged in technical work in a clinical laboratory before one might be permitted to take either written or practical examinations for certificate as technician.

Section 5 is the penal section of said Act, and prohibits, after January 1, 1938, persons not certificated as technologists or technicians to thereafter act as such. It likewise prohibits persons, firms, associations or corporations from employing technicians, except that they be certificated as provided for in said Act or are acting as apprentices as provided for in regulations to be adopted or enacted by the State Board of Public Health. This would indicate a legislative intention to leave to the State Board of Public Health the right to enact regulations not contrary to the provisions of the law itself. Such regulations must, therefore, because of the latter portion of Section 1 of said Act and the provisions of Section 5, prohibit apprentices from working or being employed in a clinical laboratory unless there are on the active laboratory staff one or more licensed clinical laboratory technicians. They may not authorize more than two apprentices to work or be employed at the same time in the same laboratory.

The last portion of Section 5 permits the State Board of Health to provide for the issuance of temporary certificates as technologists and technicians, to expire at such time as shall be sufficient to determine the qualifications of said persons for permanent certification, notwithstanding the other provisions of the Act.

Section 6 of the said Act provides as follows:

"None of the provisions of this Act shall apply to a clinical laboratory now operated or hereafter to be operated by nonprofit hospitals, by nonprofit hospital associations, or by any nonprofit hospital department which is chiefly maintained by dues or contributions from employees of a common employer or of a group of affiliated employers, the services of which are principally confined to such employees, their dependents and members of their families and persons disabled in or by reason of the operations of the employer or group of employers, or by the State of California or the United States of America, or any department, official or agency thereof, or to nonprofit foundations engaged in research work."

It is definitely the view of this office that all of the attempted exemptions in said section contained are unconstitutional with the exception of the exemptions as to clinical laboratories now operated or hereafter to be operated by the State of California, or by the United States of America, or any department, official or agency thereof.

We know of no sound reason which would warrant exempting clinical laboratories of nonprofit hospitals, nonprofit hospital associations, etc., from the operation of the Act, as the purpose of the Act is to protect the public from incompetent or inefficient technologists, technicians and apprentices, and such protection could not be secured by exempting nonprofit hospitals, nonprofit hospital associations, etc., from the provisions of the Act and permitting them to employ technologists, technicians, and apprentices having lesser qualifications.

On the other hand, it would appear that the legislature had the right to exempt the State of California and any department, official or agency thereof from the operation of the Act, for ordinarily qualifying acts do not apply to the State unless the State is specifically included therein. Indeed, in the situation under consideration, the legislature has gone further than is customary and has specifically excluded the State and its departments, officials, or agencies from the operative effect of the Act.

The exemption of the United States of America is likewise warranted in that the State of California has no authority to interfere with any federal agency acting within the scope of its federal authority. See *Ex parte Wilman*, 277 Fed. 819, and *Dobbins* vs. *Commissioner*, 16 Peters 435.

Although these cases relate to taxation, the principle therein expressed is applicable to the exemption.

This does not necessarily mean that if the attempted exemptions are eliminated from the Act that the entire Act is invalid. Indeed, it is settled law that if an attempted exemption is invalid and separable, the balance of the Act stands. Particularly is this the case where the Act itself indicates that the legislature would have adopted the statute with the invalid exemption omitted.

The rule is set forth in the case of *Bacon Service Corp.* vs. *Huss*, 199 Cal. 21, and at page 39 the Court said:

"Respondent relies on a statement in Lewis's Sutherland on Statutory Construction (Vol. 1, 2nd ed., Sec. 306), where it is said: 'If, by striking out a void exception, proviso or other restrictive clause, the remainder, by reason of its generality, will have a broader scope as to subject or territory, its operation is not in accord with the legislative intent, and the whole would be affected and made void by the invalidity of such part.' The foregoing is unquestionably the rule except when a contrary legislative intent is ascertainable from the language of the statute or the general purposes or terms of the Act. But when it appears in the statute that it was the intent that the separable void portion should not destroy the whole the invalidity of the entire statute will not necessarily result, especially when it is determined, as here, that such was the intent, and that the remainder is a full and complete legislative enactment of the subject to which it relates."

To the same general effect, see *State* vs. *Skinner* (Ala.), 101 So. 327.

Section 11 of the Act under consideration indicates a legislative intention to pass the Act should any section, subsection, subdivision, sentence, clause or phrase thereof be declared unconstitutional. This leaves in force the balance of the Act, save as to the recognized exempted official agencies, and makes every technologist, technician, nonprofit hospital association, etc., comply therewith.

Under Section 8, the State Board of Public Health is authorized to make rules and regulations providing for the reinstatement of technologists and technicians who fail to

pay the fees required by the Board within sixty days after the commencement of the year.

Such section likewise provides for a revocation of certificate "for good cause after hearing on notice."

The portion of said section providing for the reinstatement of the certificate is constitutional and proper. That portion, however, providing for the revocation of license for good cause is void. In *Hewitt* vs. *State Board of Medical Examiners,* 148 Cal. 590, the legislature undertook to permit the revocation of medical licensure by the Board of Medical Examiners in instances where the defendant made "grossly improper statements" in advertising a medical business. In discussing the language used in the statute, the Supreme Court of this State said:

"Taking a given advertisement by a physician, the members of one board might conclude that it contained 'grossly improper statements' while another board might reach an entirely opposite conclusion. One might conclude that the statement while 'improper' was not 'grossly' so. The advertisement of a physician which one board had determined did not come within the inhibition of the rule according to its judgment, a succeeding board might conclude it did. As the provision of the Act in question does not define what shall constitute 'grossly improper statements' but leaves it to be determined according to the opinions of the particular members of the board who happened to constitute it when the matter of revoking a physician's license therefor is before them, it is obvious, if such a provision can be sustained that it could operate disastrously not only upon individual physicians, but upon physicians of a particular school."

The case in effect holds that a license may not be revoked where the grounds of revocation are left to the whim or caprice of an examining board without any standard for their guidance. The language in said case is applicable to the proviso of revocation in this Act "for good cause." What might constitute "good cause" as to one board, might not constitute "good cause" as to another.

But this does not mean that the Act is unconstitutional because a license issued pursuant thereto may not be revoked or suspended pursuant to the Act in its present form. What has been stated hereinbefore with reference to *Bacon Service Corporation* vs. *Huss,* is applicable to the revocation language of the Act. The Act is, therefore, constitutional, but a license issued pursuant thereto may not be revoked. The advisability of an amendment to provide specific grounds for revocation is respectfully left to your discretion.

In conclusion, I particularly call to your attention the language of Section 10 of Chapter 804, which prohibits corporations and persons not possessing valid and unrevoked physician's and surgeon's certificates from practicing medicine and surgery or from furnishing the service of physicians for the practice of medicine and surgery. This language indicates a specific legislative intent to prevent persons licensed as technologists or technicians from making diagnoses. Persons so licensed may make findings as to particular bacteria, germs or chemical substances present in given specimens or samples, but may not, under the law, state that the presence thereof constitutes the presence or absence of any particular malady or disease.

Very truly yours,

U. S. WEBB, *Attorney-General.*

By Lionel Browne.

EDUCATOR DECRIES UNITED STATES SUBSIDY FOR MEDICAL PRACTICE

[*Criticism of the Plan of the "Committee of Four Hundred and Thirty"*]

Declaring their proposals would lead to socialization of medical practice and bureaucratic control of education and research, Dr. Robert Wilson, dean of the Medical College of the State of South Carolina, has issued a statement decrying recommendations of a group of physicians who have rebelled against the American Medical Association's opposition to federal subsidy and direction of their profession.

Doctor Wilson denounces the plan of the 430 medical men—a small minority of the 165,000 in the United States—as constituting "a serious danger to principles which the medical profession as a whole has regarded, and still regards, as fundamental." He envisions the proposals regarding the support out of public funds of medical education and medical research as "fraught with possible danger" and sees no safeguard in the principles as expressed against socialization of the profession and bureaucratic control.

"That each state should support medical education and, through its medical schools, should encourage and support scientific research," reads Doctor Wilson's statement, "is a thoroughly sound policy, but the control of such activities by the Federal Government should be viewed with the gravest apprehension."

"That it is the purpose to bring under federal control all of these (medical, educational, hospital, and laboratory) activities," continues Dean Wilson's statement, "seems obvious from Proposal 9, in which it is suggested 'that the adequate administration and supervision of the health functions of the Government, as implied in the above proposals, necessitates, in our opinion, a functional consolidation of all federal health and medical activities, preferably under a separate department.'

"This provision means nothing else than bureaucratic control both of medical practice and of such education and scientific research, which can attain the highest degree of usefulness only when permitted complete freedom of operation untrammeled by political domination."

Like the American Medical Association and most leading practitioners and teachers of medicine, Doctor Wilson sees federal socialization of medical practice primarily as a mortal blow to the independence of private practice and the well-being of the individual physician. However, like most other medical men, he also scents the peril of permitting bureaucratic control of medical education because of the likelihood of stifling independent thinking and regimentation not only of medical practitioners, but of the public.—*Christian Science Monitor,* January 5, 1938.

HIGHLIGHTS IN CALIFORNIA'S PUBLIC HEALTH WORK IN 1937*

Many new activities in the promotion of public health have been started in California during the past year, and many old activities have been either amplified or renewed.

Of first importance is the reëstablishment of the Bureau of Venereal Diseases in the California State Department of Public Health. This was made possible by legislative enactment and approved by Governor Frank F. Merriam. In 1917, California established the first state bureau of this sort and it functioned until 1920, when lack of funds stopped its work. The State appropriation now available for venereal disease control, augmented by Social Security funds, provides for a sound program in case finding, treatment, support for public clinics, free distribution of drugs to patients who are unable to pay, education in prevention and other attributes that provide effective measures in the prevention and control of these devastating diseases.

The extensive migration of agricultural laborers into California from other states and from Mexico has necessitated the institution of special activities to control communicable diseases among such laborers and to provide protection for residents of California. These activities have covered general camp sanitation, immunization against smallpox and diphtheria, instruction in child hygiene, maternal welfare, nutrition and facilities for the diagnosis of tuberculosis. Pediatricians, tuberculosis workers, nurses, and sanitary inspectors have worked in those districts of the San Joaquin Valley, particularly, where approximately 100,000 migratory laborers have been employed during the past season. A motor-truck equipped with x-ray apparatus and other facilities for the diagnosis of tuberculosis is moved from camp to camp, where clinics for the discovery of tuberculosis cases are conducted.

Because of the various hazards connected with many industries of the State, it has been necessary to establish active operations in preventing such hazards. Various dusts, chemicals, and air pollution are factors in the production of industrial diseases. Surveys have been undertaken in the various industries and coöperative efforts with manufacturers have been developed in order to lessen the industrial hazards and thereby prevent the production of industrial diseases. A special study of carbon-monoxid poisoning in transportation is now under way.

Through the provision of public health nurses in rural counties, a more extended health service to rural residents has been provided. The addition of six women physicians to the staff of the Bureau of Child Hygiene has enabled thousands of children, living in the rural districts, to receive physical examinations which were not available to

* A report submitted to the Council of the California Medical Association on January 15, 1938, by Dr. Walter M. Dickie, Director of the California State Board of Public Health.

them before 1937. Two trailers, equipped with complete dental facilities, have enabled three dentists, added to the staff of this bureau in 1937, to examine the teeth of many thousands of children in the rural districts, provide temporary repairs, and give advice to those children who are in need of such services. Dental hygienists and a nutritionist provide educational services.

Special facilities for finding crippled children and providing them with relief for their physical handicaps have been undertaken. Clinics for diagnosis, without cost to parents, have been conducted in the counties of the State.

During the year three new full-time county health units have been added to the seventeen such units that existed in California prior to this year. The new units are in Yolo, Santa Cruz, and Ventura counties. The Yolo County unit is actually a reëstablished unit, as the health work of this county was formerly conducted upon a full-time basis.

Through the provision of Social Security funds, the State Department of Public Health has been enabled to establish, in coöperation with the University of California, a school for the training of sanitary inspectors and health officers. Candidates for such training have come from all of the western states. While the State Department of Public Health has acted mainly as sponsor of the activities conducted by this school, it has assisted directly in passing upon the qualifications of candidates, and in the provision of special training along practical lines of health administration.

No special problems in communicable disease control have been encountered during the year. Influenza of a severe type was quite prevalent during the early part of 1937, but no extensive outbreak prevailed. Public health conditions, in general, have been good throughout the year. Marriages and births have increased approximately 10 per cent over 1936.

MALPRACTICE SUIT PROBLEM IN LOS ANGELES COUNTY

Report of the Los Angeles County Medical Association Committee on Defense on December 16, 1937

Considerable time and effort has been spent by your committee during the past year, studying the problem of malpractice in Los Angeles County. We have interviewed litigants, attorneys, officials of insurance carriers, and have been interviewed by plaintiffs and defendants, and have in every way possible tried to get the viewpoint of all parties concerned.

A steadily increasing cost for insurance of this kind would almost in itself tell the story. The Medical Protective Company, which carries the major portion of malpractice insurance in California, submits the following premium rates for $5,000, one case, and $15,000 total for policy year:

State	Premium	State	Premium
California	$30	Illinois	$18
Indiana	20	Iowa	18
Kansas	18	Kentucky	18
Massachusetts	36	Michigan	18
Minnesota	27	Missouri	30
New Jersey	24	Ohio	24
Pennsylvania	16	Texas	24
Wisconsin	22		

Nebraska: $1,000 to $2,500. Premium: $20

These rates show California to be second highest, next to Massachusetts. Nebraska would head the list if a policy of the same denomination were obtainable and sold at the same rate. Your committee finds difference in underwriting expense in various companies from 26 to 46 per cent of the premium. During the last twenty-five years, about a score of companies have engaged in selling malpractice insurance in California. After a few years' experience, it was found unprofitable and the majority have withdrawn from the field, leaving only three or four still engaged in this type of business.

The three American companies writing the major portion of the malpractice insurance in California are: Medical Protective Company; Aetna; and Zurich. A fourth company—Lloyd's of London—have recently come into the field, where they are writing an indemnity contract. Lloyd's operates under the excess liability law of California. There are approximately twelve different types of policies being written by the Lloyd's in Los Angeles. There appears to be considerable spread in the premiums charged by the different brokers.

These policies are certificates written by the brokers themselves, supposed to conform in general to a master policy in England, but into which the broker can write anything he chooses. These certificates show considerable variation and are practically all limited to bodily injury, or death as a result of malpractice, error or mistake. Many lack what is commonly understood to be complete coverage.

Certain irregular groups in the healing art find it impossible to buy insurance from any American company. The Medical Protective Company reports that it has lost money in the State of California during the past five years. The latter named company has had the greatest experience in defending malpractice suits, having defended 48,000 in the United States in the last forty years. From January 1, 1936 to January 1, 1937, the Medical Protective Company paid out $1.20 for every $1 premium collected in California, and for the first six months of 1937 the outlay has exceeded the premium intake by 20 per cent. This has precipitated a premium adjustment upward. The Medical Protective Company has restricted its policyholders entirely to members of the Los Angeles County Medical Association. It has restricted its limits of coverage, believing that the high limits provide bait for "easy money seekers." This, in the opinion of your committee, makes excess liability policies such as written by the Lloyd's of London and other companies necessary.

An amendment recently passed to the California Insurance Code decrees that "a surplus broker may sell insurance only if such insurance cannot be procured from the majority of the insurers admitted for the particular class of insurance, provided the insurance is not placed in the non-admitted insurer for the purpose of procuring a lower rate than would be expected by the admitted insurer."

The State of Pennsylvania, with 12,889 doctors, records only one-tenth as many malpractice suits as the State of California with 11,542 doctors. Cook County, Illinois, has approximately one-third as many suits filed as Los Angeles County, in spite of the fact that it has approximately twice as many doctors. Massachusetts is an unusually fertile field for the filing of malpractice suits and has a correspondingly higher premium rate. The highest premium, until recently, was in the State of Nebraska, where the laws admitted the introducing of evidence that the liability of the doctor was covered by insurance. Recently, this has been changed. The company previously carrying the majority of insurance in the State of Nebraska found it necessary to withdraw from the field, and upon resumption, has limited its policies in the state to $1,000 to $2,500.

There are approximately thirty to fifty men who belong to the Los Angeles County Medical Association who cannot buy insurance in the Fort Wayne (Medical Protective) company for various reasons.

It is your committee's opinion that comparatively few malpractice suits that go to trial have merit. Approximately 92 per cent of all the malpractice suits tried in the State of California are successfully defended.

It is interesting to note that in the metropolitan centers of California the press sees fit to publicize only such suits as involve men whose names have unusual news value. Your committee believes that the newspapers appreciate the inability of the doctor to defend himself against the damaging publicity, the greater percentage of which is without merit.

The greater majority of malpractice suits in which the plaintiff's case has merit are settled out of court. It is believed that approximately 50 per cent of all malpractice cases are taken by attorneys on a contingent basis, the attorney's contract calling for 33⅓ per cent of the recovery without trial and 50 per cent with trial.

Your committee has reviewed the transcribed testimony of many of the suits tried in the courts during the past year. The committee was particularly impressed with one case in which a county medical member testifying against his brother practitioner admitted on the stand that the fee involved was the only activating motive which prompted him to assume the interest of the plaintiff in the case. Your committee has also been interested in one type of suit in which a regular practitioner of medicine has sued his brother practitioner.

The committee is also impressed with the fact that medical testimony given in court is seldom scrutinized by those

qualified to judge of its accuracy or fairness. This fact apparently allows certain individuals to assume considerable latitude in their expressions of opinion.

Your committee was particularly interested to review the testimony of a medical expert appointed by the Court under Section 1871, Code of Civil Procedure, State of California, and was impressed with the eminent fairness of this witness. Unquestionably, the ends of justice could be better served by the utilization of Section 1871 (appointment of medical experts as court officers), if the judges had the opportunity to select these appointees free from political or personal influence and provided the appointees were individually properly fitted to the task.

A review of the malpractice suits for 1936 and 1937 discloses that plaintiffs' experts number approximately thirty men, residing in Los Angeles County. Of this number in 1936, approximately 20 per cent were nonmembers and irregulars, whereas a study of the 1937 record reveals the fact that approximately 70 per cent were nonmembers and irregulars.

A study of the transcribed testimony further shows definite evidence of a tendency on the part of doctors appearing as adverse experts against their fellow practitioners to give impressive testimony without adequate careful examination into, or knowledge of the matter in hand. It is not uncommon to find gross misstatements.

Your committee takes cognizance of the fact that oftentimes counsel is doing his best to confuse the witness and trick him into saying something that he does not mean.

The figures show that approximately 66 per cent of all malpractice suits filed were against surgeons, and 33 per cent were against internists and diagnosticians.

Your committee believes that in malpractice suits, as in personal injury and many other types of suits, the average jury is often incapable of decisions based on fact rather than sympathy.

There has been a decided increase in the disposition of claims, thus reducing the number of suits where the circumstances merited such a course. Certain companies are now making a premium differential to cover certain classifications where the hazard is obviously more prevalent. They are also making a strenuous effort to educate its policyholders and assist them in avoiding the pitfalls.

The Medical Protective Company reports that the average duration of a malpractice trial in Los Angeles County is four and one-half days; that the most of defense is $175 per diem. Assuming the present rate of $32 for policy covering $5,000 to $15,000, total premium at the end of thirty years would be the equivalent of approximately five days' expense in court, provided the case was won and there were no judgment damages to pay.

Your chairman feels that we are fortunate in having as a member one who is also a practicing attorney and a member of the Los Angeles Bar Association Bulletin Committee, which committee has expressed their willingness to coöperate. It is believed that the Bar Association would look kindly upon the publication of a summarization of the views of this whole situation.

1. Your committee recommends publication in the *Bulletin* of transcribed testimony of malpractice suits tried in this county, either in whole or in part. Your committee believes this would assist materially in the enlightenment of the profession at large who would otherwise not have an opportunity to acquaint themselves with what transpires in the courts of our community.

2. Your committee recommends that there be a renewal of efforts to secure legislation requiring a bond by plaintiff when filing malpractice suits, similar to the law requiring a bond to be filed with libel suits against newspapers. Your committee believes that such legislation would eliminate many of the "spite suits" and relieve the profession of the damage of adverse publicity.

3. Your committee recommends that the doctors of medicine, both on individual and institutional bases, endeavor to improve the quality of their records.

4. Your committee recommends that the Committee on Malpractice Defense be enlarged to seven members, including the president and vice-president of the Los Angeles County Medical Association. This would divide the task of reviewing the transcribed testimony in malpractice suits and greatly facilitate the work of the committee.

5. Your committee recommends that serious consideration be given by the Council to the suggestion coming from several of the carriers of this type of insurance, namely, that the cases of malpractice filed against its members be reviewed by the Malpractice Defense Committee and the committee's opinion regarding the medical merits of the case be made available to the legal department of the defendant company; that arrangements be made by which the Malpractice Defense Committee could call in consultation from the different sections, men qualified to assist in this work.

Respectfully submitted,

MALPRACTICE DEFENSE COMMITTEE.
Harold Dewey Barnard, M.D., *Chairman*
Wendy Stewart, M.D.
Fred B. Clarke, M.D.

FEDERAL FUNDS BANNED FOR DISTRICT OF COLUMBIA GROUP MEDICINE PLAN*

Ruling on Technical Grounds HOLC Loan for Health Clinic Was Illegal—District of Columbia Legal Approach to Problem

Richard N. Elliott, Acting Comptroller General, has ruled that the Home Owners' Loan Corporation was without legal authority in loaning $37,357.65 to the Group Health Association, Inc., which maintains a health clinic for one thousand workers in Federal Government offices. The decision, however, was based on technical grounds, and does not affect the broad issue of socialized medicine, which is rapidly assuming greater importance in the United States as mass clinics spread.

Mr. Elliott's decision is simply to the effect that a federal agency has no right to use taxpayers' money for purposes other than those stipulated in laws establishing the agency in question. The decision would stand equally, it is presumed, against a group recreation center, a circulating library, or any similar activity outside the main statutory purposes of the agency. A federal department or agency, he rules, has no right to spend money for what it considers the welfare of its employees.

Therefore, the basic issue of socialized medicine remains to be considered by other authorities. Already Elwood H. Seal, corporation counsel of the District of Columbia, is examining the general legal status of Group Health Association, Inc. He is studying two questions: (1) Whether the Group Health Association is a corporation illegally engaged in the practice of medicine; and (2) whether it is operating an insurance business without being licensed as such.

On these two contentious points briefs have been filed by counsel of the District of Columbia Medical Society, attacking the Group Health Association following sharp criticisms by the American Medical Association. Officials of the Federal Home Loan Bank board defend their action in supporting the Group clinic, pointing out that it is incorporated under the laws of the District, and claiming it is "selling service."

But the acting Comptroller General's ruling takes a firm stand against diversion of funds for purposes such as the health clinic. Action of the HOLC board in turning over $37,357.65 to the clinic is described as "without authority of law," and Mr. Elliott also brands as "of doubtful legality" the "emergency rooms" or first-aid headquarters maintained by most other Government departments.

NEW LAWS SOUGHT

Senator Pat McCarran (Democrat) of Nevada, at whose request the ruling was made, says it should be followed by "specific legislation making it impossible for this to recur in Government departments. . . . No department should take upon itself authority to divert public money and the appropriating of it. . . . This stands as an example of what may be going on in departments, and should result in legislation with teeth in it."

Because of the "emergency status of the HOLC, some doubt still exists as to the precise effect of the comptroller-general's ruling. The HOLC and its group-medicine offspring have a unique corporative status, and it may be necessary to have acts of Congress to limit their use of

* See also articles in December issue of CALIFORNIA AND WESTERN MEDICINE, on page 433, and editorial comment thereon in January number, on page 4.

funds. Had the decision applied to one of the old line departments, it would have been entirely binding.

HOLC authorities, defending their action, pointed to general authorization in the law creating the corporation, and giving its board power to determine "necessary expenditures under this Act and the manner in which they shall be incurred."

Mr. Elliott, in ruling on the contention, points out that Congress has passed specific laws for the welfare of federal employees, such as retirement and compensation for those injured in line of duty. He rules that the enactment of such laws renders negative the implication that such powers are included in general statutory provisions controlling other activities. He concludes:

"It has been the long-established rule in the federal service that the functions of the agencies of the United States are restricted to those activities authorized by general or special enactments of the Congress, and where an activity involves the expenditure of money of the United States, the appropriation laws must make the moneys available therefor, in no uncertain terms, if such activity is to be accepted as lawful. Accordingly, it must be concluded in the instant matter, that the disbursements and other costs were made and incurred without authority of law."—*The Christian Science Monitor*, December 21, 1937.

MOBILIZATION ON THE MEDICAL FRONT*

[District of Columbia HOLC Experiment]

Organized physicians, surgeons, and dentists are not the sole protestants against the scheme fostered by an influential section of the Roosevelt Administration to socialize the practice of medicine, surgery, and dentistry. American taxpayers, who foot the bills for all government expenses, regular and experimental; who squirm under restrictive taxes, and groan loudly at the prospect of still others, are making their voices to be heard.

Observing the experiment by a governmental agency, the Federal Home Loan Bank Board, which appropriated $20,000 to finance the establishment of a health insurance association among its two thousand employees, and promised $20,000 more, taxpayers are asking pointedly why, in addition to paying the salaries of these federal employees, they are asked to pay from one-third to one-half of their doctors', nursing, and hospital bills.

True, the acting Comptroller General has informally held this appropriation to be illegal, but nothing has been done to halt the scheme. On the contrary, proponents of positive action by Congress grow more insistent daily.

The American taxpayer is usually inarticulate—except at the ballot box. There are, however, a few organizations whose members contribute heavily to the United States Treasury and at least one of these, the Chamber of Commerce of the United States, is strenuously opposing nationalized medicine and federal health insurance, being convinced—from a study of similar experiences abroad—that they will mean another huge bill for the public, with no compensating advantage or benefit.

* * *

Nation's Business, organ of the Chamber of Commerce, warns that the experiment, begun under Government auspices, will spread to other and eventually all federal agencies and thence to include the whole public, if not resisted and checked at the outset. This is the way the business began in Germany fifty years ago, where the budget for sick insurance rose from 660,000,000 marks in 1913 to 2,330,000,000 marks in 1929!

That proponents of health insurance are determined to establish a nation-wide federal organization, reaching from Washington down into every village and hamlet, cannot be doubted when their utterances are examined.

Dr. Thomas Parran, Surgeon-General of the United States, appealed to the Association of Life Insurance Presidents in New York a few days ago to participate in the plan. Hitherto the insurance companies have looked coldly upon any governmental scheme for taking over their work, as well as that of the doctors. Doctor Parran said:

I propose that a new and result-getting national health program be built upon the skeleton forces we now possess; that we mobilize a health organization covering every community in the country under local control, with State supervision and Federal leadership. . . .

* * *

The Home Loan Bank Health Association experiment is called voluntary, but the employees did not inaugurate it; it was established by the Government agency which allocated public funds to provide part of the cost and assigned employees to administer its affairs. On that basis, *Nation's Business* estimates, the taxpayer will be defraying about one-half the expense.

A clinic with a staff of fifteen has been set up, including six or seven physicians, and complete medical and surgical service, hospitalization, nursing, laboratory tests, ambulance facilities, and special examinations, which are to be supplied to members who pay from $2.50 to $3.30 a month.

* * *

No one can blame the employees for desiring to escape from doctors' bills. Anyone who has gone through the experience of family illnesses and operations understands how savings often thus are wiped out and debts accumulated. Inevitably, if the Home Loan Board group succeeds in getting the taxpayers to foot one-half their medical bills, other Government employees will set up a clamor for similar aid. Indeed, this is one of the demands of the United Federal Workers of America, an affiliate of the C. I. O., which seeks to organize the 800,000 civilians in federal employ.

The next logical step, should all Government employees obtain "taxpayer aid" on their doctor bills, would be a public demand—encouraged, of course, by sponsors of socialized medicine—for Uncle Sam to take over doctoring on a national scale.

All these are recognized evils, but they do not primarily interest the taxpayer. He thinks in terms of a possible cash outlay of at least $10 a year for each of 800,000 federal employees, an $8,000,000 annual budget. And if he is obliged to pay part of everybody's doctor bill and support another army of bureaucrats besides, he might as well put a mortgage on the old homestead and commence to cash in his insurance policies.

* An article by Malcolm Bayley in *Christian Science Monitor*, January 6, 1938.

PUBLIC HEALTH EXHIBIT: NEW YORK WORLD'S FAIR*

Exhibits of unparalleled scientific and educational value, portraying menaces to the physical welfare of mankind and the safeguards against them, are to be presented in an entirely new way in the Medicine and Public Health Building of the New York World's Fair, 1939, it was announced recently by Grover A. Whalen, President of the Fair Corporation.

Dramatic presentations will be made to show, among other things, the latest scientific knowledge of cancer, diabetes, blood diseases, anemias, pneumonia, allergy, epidemiology, heart disease, and milk control.

Applications of sponsors for all these exhibits have been approved by the Fair's Advisory Committee on Medicine and Public Health, of which Dr. Louis I. Dublin is Executive Committee Chairman and Homer N. Calver, Secretary. All save milk control will be presented in the Hall of Medical Science. Milk control will be displayed in the adjacent Hall of Public Health.

Hall of Man.—The Health Building is now nearing completion on the site at Flushing Meadow Park. The Hall of Man, the interior of which is cathedral-like in design, is to dominate the building. The sound of a persistent, measured pulsation, low but audible to every ear, will permeate this vase chamber. Mysterious at first, it will be discovered as the heart beat of an imposing, 18-foot figure of a man standing at one end of the long hall. This model, transparent and lifelike in every proportionate detail of physiological construction, is to disclose the intricacies of every organ with which Nature has equipped the adult human creature. It is expected to be a revelation to countless visitors who never before have seen themselves in just this way.

Surrounding the figure, similarly transparent life-size models will illustrate the processes of respiration and di-

* This article is given space because the 1939 Golden Gate International Exposition, San Francisco, is likewise making plans for a large public health exhibit. See January, 1938, issue of CALIFORNIA AND WESTERN MEDICINE, page 65.

gestion, the functions of the eye and ear, the mysteries of growth and reproduction.

"We, the People."—Another feature of the hall is to be provided by an exhibit, entitled "We, the People." It will include a dramatic presentation of the various races and nationalities of the world which have contributed to make America the "melting pot." A large map is to demonstrate, by moving figures, the flow of population to every part of the United States to bring about the creation of the nation of the present.

"Vitameter."—Here also a large vitameter, similar to the speedometer in a motor car, will register the principal events of human life: birth, marriage, and death. The mechanism, set to the scale of the average week in the United States, may show on a Tuesday, for instance, the number of births to be 12,000, and on the following Thursday may register the number as 21,000 at noon and 24,000 at night. In other words, just as the cumulative mileage is recorded on the speedometer of a car, the vitameter will show the cumulative number of births from the first day of the week through the seventh. In similar fashion, the number of marriages and deaths are to be shown. One point the mechanism will emphasize is that the birth registration is more rapid than that of death.

Tuberculosis.—The exhibit on tuberculosis in the Hall of Public Health in another part of the building will be unusual and promises to arouse universal interest. It will provide a great deal of information about the disease quite unknown to the layman. There will be representations, for example, of the normal lung and of one afflicted with tuberculosis, so that visitors may see just how the diseased tissue differs from the healthy. X-ray pictures will also reveal it, and a portrayal of the tuberculin test reveal its efficiency in showing the presence of disease.

As the sufferer from tuberculosis does not always reveal that condition in his outward appearance, visitors to this exhibit will be asked to select from a large number of photographs of individuals the ones he thinks are tuberculous. It is expected that the visitor will find his selections all wrong in many instances.

Hospitals.—One section of the building's Hall of Medical Science is to be devoted to hospitals and organized care of the sick to show how many departments and persons are involved in service to an ailing individual. The multiplex details of hospital administration are to be revealed by lifelike figures centering about a patient in a hospital cot. There will be the doctor and the nurse, the only ones of the hospital staff with whom he has contact. But grouped elsewhere in the dramatic model will be shown the departments which provide service for him: the admission office, the laboratory, pharmacy, housekeeping, dietary, laundry and light and power agencies.

Demonstration of the financial side of the hospital is to be effected graphically by having the four legs of a hospital cot made of stacked silver dollars. Of these dollars, 60 per cent come from the patient, 30 per cent from state, county, or municipal government, and the 10 per cent remainder from endowment. Fifty per cent of this income is spent for food and equipment. What the piled dollars are to demonstrate is that the cot cannot stand level if the 30 per cent or the 10 per cent be missing.

There will be an animated story of persons going through hospitalization—old and young, rich and poor, youths and babies—from admission to assignment to ward or room, preliminary examination, the calling in of specialists in special cases. An operating room will be shown, with the surgeon in white gown and mask, gloved with instrument in hand, with attendant nurses. Next will be a representation of a patient's period of convalescence and, lastly, discharged from the hospital— a well, whole being.

Flanking this exhibit there will be others of roentgenology, anesthesia, and analgesia.

The Teeth.—"Living teeth as living tools," is the theme of the exhibit of dentistry and oral hygiene. In the foreground of the exhibit, a question and answer board will present the typical queries of most people, such as: How often should I brush my teeth? What good does it do to go to a dentist? What happens to me if I neglect my teeth? The visitor who seeks an answer need only push a button adjacent to the question and it flashes before him.

The transparent model of a man will show, by moving lights in series, just how infection from a tooth is carried to various parts of the body, to joints and the heart, indicating that bad teeth may seriously impair the general health. Another exhibit will be in the form of a huge mouth into which visitors may walk and find themselves surrounded, above and below, by rows of teeth. It has been suggested that the floor of this exhibit be of soft rubber in order that the entering visitor may seem to be walking on the model's tongue. The teeth in the exhibit are translucent, a light from below showing that an infected spot may not be visible by tooth inspection with a mirror. Illumination will bring to light the nerve and blood circulation of the individual tooth.

A small model of a baby's mouth is to be provided with a lever which, when manipulated by the visitor, will cause teeth actually to appear in the order of their normal growth in the infant's gums. A panel will illustrate the correct and improper growth of teeth, and there will also be graphic portrayal of the foods necessary for proper care of the teeth.

Health Departments.—Work of the Health Department of a community is to be represented on panels showing the activities during every hour of the day of inspectors and public nurses.

Coöperating Agencies.—Special committees, composed of distinguished medical men and public health experts, are developing plans for the fifty sections included in the medicine and health building. They are giving their advice without remuneration of any kind. There will be only one presentation of each subject exhibited. Already a number of these exhibits have been sponsored and work upon them is well under way.

The New York City Cancer Committee will sponsor the exhibit on Cancer, which is being developed under the direction of the following committee: Dr. Francis Carter Wood (chairman), Dr. John C. A. Gerster, Dr. Ira I. Kaplan, Mrs. Robert G. Mead, Col. Frederick J. Russell, Miss Katherine Faville, and Mrs. Francis J. Rigney.

Eli Lilly & Company will sponsor the exhibits on diabetes, and blood diseases and anemias. The exhibit for the section on diabetes is being developed under the direction of a committee, consisting of Doctors James Ralph Scott (chairman), Charles Bolduan, William Ladd, Herman O. Mosenthal, Russell C. Wilder, Elliott Joslin, Frederick Williams, Albert A. Epstein, M. M. Weaver, and Miss Grace Anderson.

The exhibit for the Section on Blood Diseases and Anemias is being developed under the auspices of Prof. Randolph West, Dr. Paul Reznikoff, Dr. Cornelius P. Rhoads, Dr. E. B. Krumbhaar, Dr. Nathan Rosenthal, and Dr. M. M. Weaver.

Lederle Laboratories, Inc., will sponsor the exhibit on pneumonia, developed under the supervision of Dr. Rufus Cole (chairman), Doctors Roderick Heffron, Peter Irving, Maxwell Finland, Jesse G. M. Bullowa, Russell L. Cecil, Edward S. Rogers, E. F. Roberts, and Miss Alma Haupt.

Lederle Laboratories, Inc., will also sponsor the exhibits on allergy and epidemiology under direction of the following committees: On allergy, Doctors Francis Minot Rackemann (chairman), Robert A. Cooke, Matthew Walzer, Maximilian Ramirez, Marion B. Sulzberger, Joseph Harkavy, Ranklin Stevens, and E. F. Roberts. On epidemiology, Doctors E. S. Godfrey (chairman), Clarence Scamman, George Ramsey, William Best, Charles Vivian Akin, W. H. Frost, and E. F. Roberts.

Ciba Pharmaceutical Products will sponsor the exhibit on heart disease, which is being developed under the guidance of the Heart Disease Committee which includes: Doctors A. E. Cohen (chairman), E. P. Boas, L. A. Connor, J. H. Crawford, C. De la Chapelle, Stuart Hart, James B. Herrick, E. B. Krumbharr, E. M. Landis, Robert L. Levy, A. G. Macleod, C. McEwen, Hugo Roesler, J. M. Steele, Homer S. Swift, P. D. White, Harold J. Stewart, and Miss Elizabeth McKenzie.

Cherry-Burrell Corporation will sponsor the exhibit on Milk Control, developed under the auspices of the following committee: Doctors Milton J. Rosenau (chairman), Alec N. Thomson, Paul B. Brooks, Leslie Frank, William B. Palmer, Samuel Abraham, John G. Hardenbergh; Prof. J. M. Sherman, and Walter Von D. Tiedeman.

Applications for other sections are pending before the committee which has planned a unified and coördinated exhibit on Man and His Health.

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. XI, No. 2, February, 1913

From some Editorial Notes:

The Legislature.—At the time of writing it is impossible to say just what has been proposed in the way of medical legislation, though some things are quite apparent. The usual attempt is to be made to secure special boards of examiners in almost every sort of freak cult. A number of bills have been drawn which may or may not be introduced; one of them provides an entirely new medical law on an entirely new plan, but no copy of the bill has as yet come to our attention. Another proposed law provides for separate boards of examiners for regulars, homeopaths, eclectics, osteopaths, naturopaths, and divine healers!

* * *

Medical Building.—Have you thought anything about that suggestion in the last *Journal* as to the county society owning its own building? It can be done by a good many—if not most—of the county societies in California. You all pay rent to somebody; why not pay it to the county society? It is merely a matter of finance and of getting together, and the getting together, in some places, seems to be the hardest part of the problem.

From an article on "Some Factors in Habitual Constipation," by Raymond Russ, M.D., San Francisco.—The center of surgical discussion shifts from time to time. The brain, the neck, the thorax, occupy in turn the circle of the spotlight, which may be switched at any moment to some other portion of the stage of endeavor. Surgery, constantly trying to increase its scope, has fads and fancies. The opening of a new field is always followed by a stage of overenthusiasm, and sometimes reckless and ill-considered operating. Concomitant causes are lost sight of in the presence of what is thought to be a newly evolved principle, so desirous are we of reducing our asset of painful experience to the proportions of absolute, scientific fact.

From an article on "Feeding in Later Infancy," by H. H. Yerington, M.D., San Francisco.—During the past six or eight years, probably no subject in medicine has received more attention than infant feeding, and with numerous schools advocating so many various methods, the family physician, if he tries to keep up with the literature, finds himself in a hopeless tangle.

From an article on "Dietetics from a Modern Standpoint," by Annie W. Williams, M.D., Hayward.—In this age of searching analysis, keen observation, thorough research, extensive and exhaustive laboratory experiments, practical demonstrations and laborious investigations, dietetics, the science or study and regulation of the diet has not been overlooked, but has received its full and much-needed share of attention. World-wide questioning is being directed to the disquieting fact that eating just for self-gratification, the good taste and flavor because you happen to like it, and to satisfy a pampered, over-cultivated and oft-times, more or less, perverted appetite, is possibly not all it should be.

From an article on "The Technique of the Removal of Foreign Bodies and New Growths from the Esophagus," by W. P. Millspaugh, M.D., Los Angeles.—This subject is a little bulky for a ten-minute paper, and I shall begin immediately to use the pruning shears. That portion of it referring to new growths is an unknown field to me, and I

†This column strives to mirror the work and aims of colleagues who bore the brunt of Association work some twenty-five years ago. It is hoped that such presentation will be of interest to both old and new members.

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By Charles B. Pinkham, M.D.
Secretary-Treasurer

"The State District Court of Appeal issued a writ of mandate today requiring Superior Judge J. J. Van Nostrand of San Francisco to prepare and file a finding of facts in a case involving the rights of chiropractors. Chiropractors are seeking a comprehensive court interpretation of the law pertaining to their profession. M. James McGranaghan, a chiropractor and lawyer, in April, 1935, filed application for a declaratory judgment to determine what rights he could exercise under his license as a chiropractor. The California Drugless Physicians' Association and a number of Los Angeles chiropractors intervened in the action. In September, 1935, Judge Van Nostrand issued a memorandum opinion, but stated he did not regard a finding of facts as necessary. Application for the writ of mandate was made to the State District Court by Attorney-General U. S. Webb." (Fresno *Bee and Republican,* December 11, 1937.)

"Local doctors were warned yesterday to lock their cars and to refrain from leaving medical kits in them while making calls or visiting hospitals, due to a new outbreak of thefts in Marin County. According to word received here yesterday from Police Chief Sabin D. Kane of San Rafael, kits containing drugs and equipment worth more than $300 have been stolen from physicians' cars in that city during the past few days. Included in the equipment stolen were a complete blood-pressure machine, two sets of syringes in a leather case, ear and throat probing instruments, a quantity of morphine, and two sets of hypodermic needles." (Santa Rosa *Press-Democrat,* December 24, 1937.)

"Medical kits of five Bakersfield doctors have been stolen from their automobiles during the past several days, according to city police. All but one have been recovered. . . . Officers believe the thefts to be the work of a dope addict." (Bakersfield *Californian,* December 30, 1937.)

"A prominent Pasadena eye, ear, nose and throat specialist, Dr. H. M. Griffith, whose trial in Los Angeles County courts in 1933 over the shooting of a banker friend who allegedly defrauded him of over $50,000 was interrupted when he was declared mentally incompetent, appeared before the Mendocino County Superior Court Friday. On a writ of habeas corpus, the doctor asked for release from the Mendocino State Hospital, where he has been confined since that time, so that he might return to Los Angeles County to defend himself in the resumption of the criminal case against him. . . . Two deputy district attorneys from Los Angeles County, Hugh McIsaac and D. J. O'Leary, were on hand to present their case, urging that the man had not recovered sufficiently from his insanity to offer aid to his counsel in his defense. . . . Doctor Griffith, a graduate of George Washington Medical School in St. Louis, and a normal-appearing gentleman, somewhat gray and wearing horn-rimmed spectacles, testified for himself concerning the shooting of a Mr. Hubbard, vice-president of the Citizens Savings Bank of Pasadena, with whom he had entrusted his funds. In two civil trials he had gained no satisfaction for the fraudulent manipulations of his money by Hubbard, which included a check for $52,500 from the city of Pasadena for property condemned for Civic Center purposes. He testified that he felt there had been tampering with the jury in the first trial, while the second had been decided on a technicality. These beliefs, with others, were listed by Deputy District Attorney McIsaac of Los Angeles as 'delusions' and adequate proof of Griffith's unsound mental condition. . . ." (Ukiah *Redwood Journal,* December 11, 1937.)

ONLY THESE SOLUTIONS ARE VACOLITER PROTECTED

BAXTER'S

INTRAVENOUS SOLUTIONS IN VACOLITERS

Your books will tell you that Baxter's Intravenous Solutions in Vacoliters are economical

Compare for yourself the costs of hospital made solutions . . . breakage of flasks . . . repair, maintenance, and heating of still . . . the cost of necessary supervision . . . discarding of old, unusable solutions.

Compare this with the cost of setting up Baxter's service for your hospital. Your accountant will show you, *with your own figures* that Baxter's Dextrose and Saline Solutions in Vacoliters are economical. Because their cost is a definite, accountable quantity, your budget is not sapped by a dozen hidden charges. You know exactly what you are spending. You eliminate the cost of labor . . . of breakage . . . of waste . . . of maintenance.

The labor of preparation is all done at the Baxter laboratories. You pay nothing for the added safety and security of Baxter's Solutions. Having these fine solutions available at a moment's notice in times of emergency, does not cost you a single extra penny. Excellence and convenience are all a part of the economical Baxter service. You can find these things out for yourself. Your books will tell you Baxter's Solutions *are* economical.

NOT ADVERTISED TO LAITY

BOARD OF MEDICAL EXAMINERS

(Continued from Page 30)

representing himself as a famous physician who was collaborating with a London doctor on a new health plan. His criminal record revealed that he was once arrested in Milwaukee in 1926 and sentenced to a year in prison for forgery; that he later was sentenced to the Indiana State Reformatory for from one to ten years, and following his release there served eighteen months in a California prison for fraud." (Santa Rosa *Press-Democrat*, December 19, 1937.)

"Dr. Paul Eid's efforts to regain his liberty by writ of habeas corpus from the Superior Court failed today in Redwood City when Judge Maxwell McNutt ruled that the writ was not proper legal procedure. Doctor Eid, young Burlingame physician, was jailed November 3 on charges of indecent exposure filed by Burlingame police. In his petition for the writ, he alleged he had been promised the case would be dropped if he pleaded guilty and left the city. From the bench, Judge McNutt advised Doctor Eid's attorney, Bernard P. Sharon of San Mateo, to proceed with a writ of coram nobis—an order vacating judgment because of error of fact not known to the judge—in the lower court. . . . If the writ is denied, Sharon will appeal to the Superior Court, he said. If it is granted, Doctor Eid will be given an opportunity to plead not guilty and go to trial in the Burlingame court." (Burlingame *Advance-Star*, December 8, 1937.)

"Eugene J. Rinaldo, convicted last April of practicing medicine without a license and sentenced to six months in the county jail, today was placed on two years' probation by Municipal Judge Harold B. Landreth. Rinaldo, one-time candidate for the Board of Education, appealed the original sentence, which also carried a fine of $500, but the appellate court upheld the conviction. Rinaldo paid the

$500 fine today before Judge Landreth, who on recommendation of the probation officer, granted probation." (Los Angeles *Herald and Express,* December 14, 1937.)

"Aris Amaral, 39-year-old self-described Arabian minister, was arrested by Los Angeles police yesterday at 400 South Rampart Boulevard for San Bernardino authorities. He is charged with grand theft. The arrest followed that of his asserted partner, John Pritchard, alias Rev. Korda van Ormond, in Houston, Texas. Pritchard now is awaiting trial in San Bernardino on a similar charge. Both were indicted by the San Bernardino County Grand Jury. The complainant is Mrs. Belle Shinkle of Redlands, who charged she purchased a half-interest in their San Bernardino fortune-telling establishment last May for $3,700. Her money, she understood, was to be used to launch radio horoscope readings. On her return from a trip East, she told Sheriff Shay, she could find neither her partners nor their fortune-telling enterprise. Amaral's bail was set at $8,000 and Sheriff Shay was notified of his arrest. Several years ago Amaral founded the Temple of Isis in the Hollywood hills, which was closed after he was convicted of violating the State Medical Practice Act." (Los Angeles *Times,* December 15, 1937.)

Federal Food and Drug Administration Lists Recent Court Terminations.—The Federal Food and Drug Administration of the United States Department of Agriculture has issued a statement of criminal actions recently terminated. The actions, brought under the authority of the Food and Drugs Act, cover a wide variety of offenses, and are so many that the current statement merely catalogues them into various categories. . . .

Cases Involving Drug Products

Cases involving drug products that did not conform to the represented standards were terminated as follows: Frank F. Lefkoff, trading as Authorized Brands, Atlanta, Georgia, turpentine, fine $25; Columbia Medical Laboratories, New York, ephedrin hydrochlorid, $50; Connecticut Chemical & Disinfectant Co. (Edward T. and Cyril F. Ahern), New Haven, Connecticut, aromatic spirits of ammonia, $25; Intra Products Co., Denver, Colorado, ampoules phenobarbital sodium (unsterile) and ampoules Pituipost, $300.

Meyer Bros. Drug Co., St. Louis, Missouri, phenolphthalein, and tincture of belladonna leaves, $400 and costs; Price Drug Co., Inc. (Samuel and Philip C. Thomas), New York, three ointments, paid fines of $225 and suspended fines of $225; Roma Extract Co. and Joseph Graceffa, Boston, Massachusetts, citrate of magnesia, $20; Shores Co., Inc., Cedar Rapids, Iowa, Epsom salt tablets, $25 and costs; Alva F. Watkins Co., Jackson, Michigan, six pharmaceutical preparations, $500; and Zenith Drug Co., New York, boric acid, $20.

For Acidity and Allied Conditions, we suggest
ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

Patent Medicine Cases

Patent medicine cases during the three-month period involved twenty-nine shippers. The terminations were: Alpha Laboratory, Inc. (Dr. and Mrs. Frank R. Braune), Chicago, Illinois, "Lacta Kaolin" preparations, falsely and fraudulently represented as treatments for dysentery, cholera, and stomach disorders, fine $110; Bleecker Foster, Inc., St. Paul, Minnesota, "Flame Liniment" for rheumatism, $5; G. F. Foster Company, St. Paul, Minnesota, "Simba," $20.

Creotina Chemical Co., Belleville, Illinois, "Sanadon," for infectious diseases of the mouth and gums, $200 and costs; Clyde Collins Chemical Co., Memphis, Tennessee, three "Puritan" brand preparations for rheumatism, kidney and bladder troubles, malaria, dysentery, cramps and other conditions, $400 and costs: Eby Remedy Co., Marengo, Iowa, "Eby's Swine Medicine," $25 and costs.

Erie Laboratories, Cleveland, Ohio, six preparations for hay fever, indigestion, bladder disorders, and other conditions, $150 and costs; Fairey Wholesale Drug Co., Orangeburg, South Carolina, "Fairey Oil" for neuralgia, rheumatism, sore throat, $25; Wallace N. Key, Arthur E. Fest and Benjamin H. Hickman, operating as Foundation Labs., Inc., Chicago, Illinois, "Rx 444 for Males" and "Rx 333 for Females," rejuvenation treatments, fine $600 and costs; E. Fougera & Co. and Tam Co., New York, "Tam," represented as made of "natural laxative fruits," as containing "no drugs," and as a "jam," when in fact it contained senna leaves and other plant laxatives (the product was also moldy), $50.

Gall-Flo Labs., Inc., Cleveland, Ohio, "Gall-Flo," for ailments of livestock, $100 and costs; Heinrich Chemical Co., Minneapolis, Minnesota, seven preparations for rheumatism, dysentery, mouth infections, and poultry diseases, $45; Hi-Test Labs., Inc., Cleveland, Ohio, "Dr.

(Continued on Page 38)

CANNED FOODS IN THE CONTROL OF SUBACUTE DEFICIENCIES OF THE ANTI-PELLAGRIC FACTOR

As a result of his classical researches, Goldberger first proposed the name "Pellagra-Preventive Factor" for that component of the vitamin B complex which he found effective in the prevention of human pellagra. Subsequently, the terms vitamin "G" and sometimes vitamin "B_2" were used to designate this effective factor. However, until biochemical research has conclusively established its identity, it is now apparent that we had best return to Goldberger's original designation for that entity which protects the human against pellagra.

In contrast to the other vitamin deficiencies, cases of severe deprivation of the anti-pellagric factor are not uncommon in certain regions of the United States. It is also known that if the intake of food be drastically restricted for some reason—alcoholism, for example—pellagra may be encountered in localities in which the discase is not endemic (1). For these reasons, it is not unreasonable to suspect that subacute or latent deficiencies of the P-P factor may also be existent in this country.

In the absence of typical dermatitis, available means for the diagnosis of deficiencies of the anti-pellagric factor are not entirely satisfactory. The practitioner must rely upon a variable group of less specific symptoms such as glossitis, diarrhea, digestive disturbances, and nervous and mental disorders. However, consideration of these symptoms along with an evaluation of the diet upon which the subject had been maintained, may permit the conclusion that suboptimal intake of the P-P factor should be suspected.

The treatment of severe or perhaps even the mild manifestations of this dietary deficiency may require intensive therapy with food products or preparations known to be rich in the pellagra preventing factor. However, prevention of pellagra and maintenance of the cure appear to be largely matters of dietary regulation. In this connection, commercially canned foods deserve particular mention.

Goldberger and his associates directed considerable attention to evaluation of the pellagra-preventive powers of common foods. The values of foods, many of them canned foods, in the prevention of pellagra have been determined (2) by investigations in which human subjects were used.

In view of these facts, it is apparent that certain commercially canned foods will prove reliable, convenient and economical in the formulation of diets calculated to protect against mild or severe deficiencies of the P-P factor.

Fads Travel Faster Than Facts.*—Fads abound in this scientific age and thrive even among the intellectual. At times it seems that in order to protect society, faddism should be listed among the infectious maladies and the faddist put in isolation. Many are so susceptible that even slight exposure results in a period of distress. In this day of consumer protection it might be wise to have health officers ferret out faddists just as they pursue scarlet fever and mumps. A purple placard on the doors of victims' homes might prevent dissemination and exposure of the immature and unscientific and show the community that more than ordinary precautions must be taken to prevent the spread of faddism.

But speaking seriously, faddists are a problem. Food faddists seem most numerous. Great faith is placed in unusual diets which eliminate certain foods altogether, restrict combinations said to be incompatible or inharmonious or stipulate huge excess of other food essentials. Rare it is to find a person who relishes every combination, eats every protein, or who does not insist on a vitamin or mineral concentrate or carbohydrate. Since an occasional one benefits from excessive injection of vitamins, unusual diets are made to sound plausible to others. Unfortunately, certain physicians succumb and prescribe the unusual and spectacular. They justify the treatment by reasoning that if drugs are not indicated and that if the diet does the patient no harm, it serves the purpose better than psychiatry. Unfortunately these diets are often passed on to others who practice self-diagnosis and the public believes that they have particular merit.

But physicians deserve little blame for most food fads. People with something to sell—either books, lecture tickets, cooking equipment, or unusual foods that bring high profits, are often responsible. Advertisers whose statements imply rather than state untruths are the worst offenders. It is easy to see how fads get a following. All of us dislike

being back numbers, and nothing is more feared today than loss of health. The cost of medical care, the possible loss of position and of economic security have made everyone alert to accept any suggestion said to prevent illness, whether the preventive consists in cooking in a particular metal, alkalinizing diets, or eating only raw foods.

With the public health-conscious most foods have come to be sold for their health giving rather than their attractive qualities. The health-mindedness is often increased by well-meaning but short-sighted teachers. In many schools vitamins and minerals are made to seem like magical little things that prevent illness, lessen dental bills, and insure buoyant health. Consequently, any food containing vitamins and minerals in any amount appears to have merit, little or much it matters not. These teachers have thus harrowed and cultivated the mental soil until it is ready for any seed sown by the propagandist without realizing the results.

It is high time that both minerals and vitamins were put in their proper place as essential to good nutrition, but never magical in their effects in the human diet. To have magical effects they must have been totally lacking previously. If a more generous provision improves the health, the patient admits an inadequate diet originally. We should have more pride than to cast such a reflection on the family menus and enough common sense to improve them with ordinary foods.

More emphasis in schools should be placed on the amounts of minerals and vitamins found in ordinary foods as compared with the accepted requirements of these food essentials. In other words, science should be brought down to earth. To the public, science seems magical and beyond comprehension because no simple basis is given them for interpreting and evaluating advice so generously given on the radio, in magazines, and by neighbors.

Human beings do not like to be fooled. They may be lazy about reasoning or fearful of their own conclusions because science seems complicated; therefore, they accept pronouncements which are made cleverly, convincingly, and, as far as they are able to judge, authoritatively. A scientifically trained, honest research worker or physician cannot speak as conclusively because he sees many sides and aspects of the problem which prevent a finality in his thinking. How can people learn that absolute certainty almost always bespeaks the quack!

Unquestionably, all like to believe that quick cures which require little effort on our parts and no unpleasant changes in our regimens are possible. Many of us crave a little attention and sympathy, and a spectacular diet answers the purpose.

The middle-aged are, of course, most susceptible. With youthful buoyancy departing, figures widening, digestive ability slowing down, they like to believe that rejuvenation is possible. Furthermore, the middle-aged pride themselves on their youthful open-mindedness, often not distinguishing between open-mindedness and gullibility. Ready acceptors of new ideas are often agitated rather than educated by what they hear and read. How people can believe that any common article of diet eaten with other foods or separately for hundreds of years can cause poisonous "acid" products, explosive reactions or impair society's vitality is difficult to understand. The explanation, perhaps, lies in the fact that they expect modern scientific research to reveal startling facts. Being untrained, they have no fund of information with which to judge the various pronouncements they hear and see.

Fads travel faster than facts because explanations are simpler; because fads beget more hope and are often pleasanter to believe than facts; because fear of expensive illness sometimes numbs the intelligence; and because science has grown so fast that it has fallen short in explaining and applying known facts to the everyday problems of man.

Fire is latent within each of us, but it takes the right spark to make it flame. Coming to know some of the best members of our race, we learn how to think and how to live.

IN SINUSITIS AND HEAD COLDS

when you prescribe a liquid vasoconstrictor, consider three points:

1

PROLONGED EFFECTIVENESS

'Benzedrine Solution' produces a shrinkage which lasts 18 per cent longer than that produced by ephedrine.

2

MINIMUM SECONDARY REACTIONS

On continued use 'Benzedrine Solution' produces practically no secondary vasomotor relaxation.

3

REAL ECONOMY

'Benzedrine Solution' is one of the least expensive liquid vasoconstrictors.

BENZEDRINE SOLUTION

ACCEPTED AMERICAN MEDICAL ASSN.

Benzyl methyl carbinamine, S.K.F., 1 per cent in liquid petrolatum with ⅓ of 1 per cent oil af lavender. 'Benzedrine' is the registered trade mark far Smith, Kline & French Labaratories' brand af the substance whose descriptive name is benzyl methyl carbinamine.

SMITH, KLINE & FRENCH LABORATORIES

Philadelphia, Pa. **Established 1841**

EXERCISE

FOR BOWEL REGULATION

The patient who is unable to exercise or adhere to a suitable diet will appreciate the aid of Petrolagar to maintain a regular bowel movement. Petrolagar softens hard stools and assists the bowel to function normally. Its pleasant flavor, devoid of the oily taste associated with plain mineral oil, makes Petrolagar very easy to take. Prescribe Petrolagar for bowel management, it's "Council Accepted." Petrolagar Laboratories, Inc. • Chicago, Ill.

Petrolagar . . . Liquid petrolatum 65 cc. emulsified with 0.4 Gm. agar in a menstruum to make 100 cc.

When Steers Had Long Horns

THE medicinal value of the glands of internal secretion was not recognized.

But times have changed, as well as cattle. Now, the therapeutic value of certain gland products is definitely established and each year adds to our knowledge in this important field of therapeutics.

To the physician prescribing gland products we urge specification of "Wilson," because it connotes a product made at the source of supply from fresh glands, processed promptly, with the aim of conserving maximum hormone activity, in a laboratory devoted exclusively to the endocrine field.

Medical skill and good nursing care are essential and so is Sleep

ONE THING the patient requires and not the least essential—is sleep. By restoring the physical resources of the body, sleep often turns the tide in favor of recovery.

When sleep is difficult, the physician may prescribe Tablets Ipral Calcium with assurance of safety. A small therapeutic dose produces restful sleep closely resembling the normal, from which the patient awakens generally calm and refreshed. Ipral Calcium is readily absorbed and rapidly eliminated. Undesirable cumulative effect may be avoided by proper regulation of the dosage. No digestive disturbance or untoward organic effects have been reported.

IPRAL CALCIUM (calcium ethylisopropylbarbiturate) is supplied in 2-gr. tablets and also in powder form—for use as a sedative and hypnotic.

IPRAL SODIUM (sodium ethylisopropylbarbiturate) is supplied in 2-gr. capsules for hypnotic use and in 4-gr. tablets for preanesthetic medication.

IPRAL CALCIUM (Powder) is available in 1-oz. bottles. Tablets Ipral Calcium 2 gr., Tablets Ipral Sodium 4 gr., and Capsules Ipral Sodium 2 gr. are available in bottles of 100 and 1000.

Social Security Program Report on Advances in 1937. Nation-wide operation of the Social Security Act has been achieved in 1937 for the first time, according to a year-end statement issued today by Arthur J. Altmeyer, Chairman of the Social Security Board. "It is no longer necessary," he declared, "to discuss the Act in terms of its promises. Today the Social Security Board is able to report on nation-wide achievements in public assistance to the needy, old-age insurance, and unemployment compensation."

In summarizing the year's progress, Chairman Altmeyer stated that more than 36,000,000 wage-earners now have social security accounts under the old-age insurance program; it is estimated that approximately 21,000,000 workers are employed in jobs covered by the approved unemployment compensation laws of all the states, and over 2,100,000 of the needy—the aged, the blind, and dependent children—are receiving regular allowances from federal, state and local funds in every state but one. Among other outstanding developments, he cited particularly the Supreme Court decision, handed down on May 24, upholding the constitutionality of the Act's social insurance provisions, and the preparation for the payment of unemployment compensation benefits beginning January, 1938, in twenty-one states and the District of Columbia.

In addition to these major advances in the programs administered by the Social Security Board, Mr. Altmeyer noted that the five parts of the Act directed by other Government agencies—public health, vocational rehabilitation, and three child-welfare services—are also in effect on a substantially national basis. He pointed out that much of the credit for the rapid development of the Social Security Act, in the less than two years since it became effective in February, 1936, is due the states, since they must both initiate and administer all programs except old-age insurance. . . .

Mr. Altmeyer reported that on December 1, 1937, the funds standing to the credit of the twenty-three states which will be paying unemployment compensation benefits in January amounted to more than $400,000,000; and that those credited to the thirty-one states to pay benefits before the close of 1938 came to nearly $500,000,000. He reported also that the total amount of federal funds appropriated to the old-age reserve account now comes to some $690,000,000. Benefits under these two insurance programs are being paid from special accounts in the United States Treasury, the unemployment trust fund and the old-age reserve account, respectively. He called attention to the fact that these funds may be expended only for the specific purpose for which each is intended and that "the law requires all social insurance funds to be invested in Government obligations, the safest investment in the world.

(Continued on Page 48)

3 OUT OF 4
SMOKERS' COUGHS CLEARED COMPLETELY

Patients with smokers' coughs were instructed to change to Philip Morris cigarettes.

In 3 out of every 4 cases, the coughs disappeared completely.

When these patients changed back to cigarettes made by the ordinary method of manufacture, within a limited number of days, coughs had returned in one-third of the cases.

This Philip Morris superiority* is due to a distinct difference in manufacture. Philip Morris employs diethylene glycol as the hygroscopic agent—proved a major advancement in cigarettes.

CAL

Colfax School for the Tuberculous

COLFAX, CALIFORNIA

There are two units, The Colfax Hospital and the Bushnell Sanatorium, for the treatment of Pulmonary Tuberculosis.

The Colfax School for the Tuberculous is located in the pine clad Sierra Nevada foothills, at an elevation of 2400 feet; an elevation free from the fogs of the valleys and free from extremes of heat or cold.

This Institution supplies, among other advantages:—

1. Individual care and supervision under skilled physicians.
2. Education as to the essentials of recovery from, and the prevention of the spread of, disease.
3. Complete laboratory and x-ray equipment.
4. Every proved method of treatment, including pneumothorax and phrenic nerve interruption. (Major thoracic surgery referred to skilled thoracic surgeons.)
5. An absence of institutional atmosphere.
6. Reasonable rates.

(Continued from Page 46)

Workers can thus be sure their benefits will be paid when due."

Concluding his review of the year, Mr. Altmeyer stated that accomplishments during 1937 give assurance that greater progress will be made in the future. "The Social Security Act in its present form," he said, "is far from perfect or final; it will undoubtedly be improved and extended as we learn from experience. But by 1938 there can be no question that the American people have set their faces in the direction they propose to go. Nothing can stop their advance toward social security for themselves and for their children."

A generation or more ago, men and women commonly lived out their lives according to the die cast in the days of their youth. Training received in early years had to suffice for whatever demands might later arise. Experience, to be sure, added value. However, something was likely to be lost, for mental powers and modes of skill deteriorate through disuse. The idea of renewing or increasing one's powers in mature life was seldom entertained. Moreover, such a procedure was not supported by public sentiment. Any grown-up man who might seek some kind of schooling would have been regarded as queer. And to be thought queer was, of course, to be "in a parlous state." Nowadays, fortunately, people are coming to view these matters differently. It is no uncommon thing for a man to review, extend, and bring up to date what he has once learned, to acquaint himself with a new field of ideas, to submit himself to a new discipline, or to learn a new art. The die cast in youth does not necessarily doom one to a single, narrowing path.—Leon J. Richardson.

Births Increase in California.—During the first six months of the year 1937, there were 44,313 births registered in California, and 40,081 registered during the first six months of last year. This represents an increase of 10.6 per cent.

WE KNOW YOU'LL WONDER AT THIS STATEMENT, DOCTOR

Ralston Wheat Cereal

Costs less than 1¢ a serving

yet is 2½ times richer in vitamin B than whole wheat

When you think of expensive, complicated vitamin concentrates it's difficult, we know, to believe this simple statement. Yet Ralston Wheat Cereal *does* cost less than 1¢ for a generous bowlful—and that same bowlful provides 2½ times as much vitamin B as a similar serving of natural whole wheat.

That's because Ralston Wheat Cereal is fine, full-flavored wheat—enriched with sufficient quantities of pure wheat germ to make it 2½ times richer in this precious vitamin B which does so much to keep appetite and digestion normal. (Each gram of Ralston contains 1½ International units of vitamin B.)

In addition, Ralston is completely cooked and readily digested after 5 minutes over an open flame. Research Laboratory Report and samples of Ralston Wheat Cereal will be sent to you on request. Use the coupon.

RALSTON WHEAT CEREAL

RALSTON PURINA COMPANY, Department CW, 2230 Checkerboard Square, St. Louis, Missouri

OTOLARYNGOLOGY

John H. Childrey, M. D.
Ernst Wolfes, M. D.

In the past a frequent complaint from mothers was the expense incurred when the large bottle of antiricketic was accidentally upset.

OLEUM PERCOMORPHUM

Even if the bottle of Oleum Percomorphum is accidentally tipped over, there is no loss of precious oil nor damage to clothing and furnishings. The unique Mead's Vacap-Dropper* is a tight seal which remains attached to the bottle, even while the antiricketic is being measured out. Mead's Vacap-Dropper offers these extra advantages also, at no increase in price:

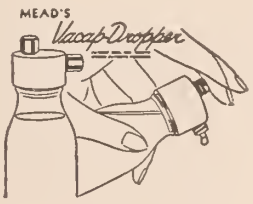
Unbreakable

Mead's Vacap-Dropper will not break even when bottle is tipped over or dropped. No glass dropper to become rough or serrated.

No "messiness"

Mead's Vacap-Dropper protects against dust and rancidity. (Rancidity reduces vitamin potency.) Surface of oil need never be exposed to light and dust. This dropper cannot roll about and collect bacteria.

Accurate



This unique device, after the patient becomes accustomed to using it, delivers drops of uniform size.

No deterioration

Made of bakelite, Mead's Vacap-Dropper is impervious to oil. No chance of oil rising into rubber bulb, as with ordinary droppers, and deteriorating both oil and rubber. No glass or bulb to become separated while in use.

How to Use MEAD'S *Vacap-Dropper*

Remove both top and side caps. Wipe dropper tip. Regulate rate of flow by using finger to control entrance of air through top opening (see below). Oleum Percomorphum is best measured into the child's tomato juice. This is just as convenient and much safer than dropping the oil directly into the baby's mouth, a practice which may provoke a coughing spasm.

U. S. Pat. Nos. 2105023 and 101575.

*Supplied only on the 50 c.c. size; the 10 c.c. size is still supplied with the ordinary type of dropper.

OLEUM PERCOMORPHUM
More Economical Now Than Ever

MEAD JOHNSON & CO., Evansville, Indiana, U. S. A.

Just as the evolution of animal life is traced from formless matter, so may public health also be said to have its protoplasmic stage when it was without form or structure. But instead of its being a constantly progressing evolution as in the case of animal life, its forward movement has been punctuated by periods of retrogression. The rise of public health concepts is intimately bound up with the development of medical knowledge. The different epochs in the evolution of medical lore, therefore, are closely paralleled by similar epochs and eras in public health advancement.—The Health Officer.

Sleep is even more necessary for the maintenance of life than is food, for one cannot live as long without sleep as one can without food. Sleep is generally more important than medicine. Hence, the patient's sleep should not be disturbed for medicinal treatment unless continued effect is extremely important.—Fantus.

ISOPHRIN

TRADE MARK REG. CALIF.

A non-irritating Neo-Synephrin Solution used as a nasal spray or drops

ISOPHRIN is ¼% Neo-Synephrin Hydrochloride in a special isotonic solution prepared only by Broemmel Laboratories.

Neo-Synephrin Hydrochloride is a synthetic substance of epinephrine-like action, but possesses the advantage that it is more stable, its effects are prolonged, and it does not irritate the nasal mucosa or cause sneezing.

Prolonged contact with certain metals may cause discoloration, therefore use spray bottles with only glass or hard rubber fittings.

Supplied in original bottles of 1 oz.

President, Charles S. Roller, Woodland Clinic, Woodland.
Secretary, W. J. Blevins, Jr., Woodland.
Meeting, *First Tuesday.*

Yuba-Sutter County Medical Society
President, Neal M. Loomis, Yuba City.
Secretary, Fred W. Didier, Wheatland.
Meeting, *Second Tuesday.*

(Roster lists continued on advertising page 6)

MALTINE WITH COD LIVER OIL

. . . proved in practice

The experience of two generations of physicians who have prescribed MALTINE WITH COD LIVER OIL successfully is ample evidence of the value of this 63-year-old preparation. Further evidence is the result of biological experiments which have proved that the vitamin-A efficiency of cod liver oil is doubly enhanced when it is emulsified with Maltine. These facts, plus the advantage that MALTINE WITH COD LIVER OIL has none of the unpleasant taste of vitamin-bearing oils, make the preparation desirable for the prescription of vitamins A and D. The patient receives as well the valuable components of Maltine itself.

MALTINE WITH COD LIVER OIL and IRON IODIDE offers the same advantages in cases where iron iodide is indicated. It contains two grains of freshly prepared iron iodide per fluid ounce. The Maltine Company, 60 Hudson Street, New York City.

COÖPERATE WITH YOUR ADVERTISERS

CALIFORNIA AND WESTERN MEDICINE, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention CALIFORNIA AND WESTERN MEDICINE.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this JOURNAL to members and readers.

A SERVICE AGENCY—FOR READERS

THE JOURNAL of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California Medical Association. The Cooperative Bureau is equipped with catalogues and price lists of manufacturers. and can supply you information hy return mail.

Perhaps you want a certain kind of instrument which is not advertised in CALIFORNIA AND WESTERN MEDICINE, and do not know where to secure it; or do not know where to ohtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will he advertised in our pages; hut if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. CALIFORNIA AND WESTERN MEDICINE and the A. M. A. Service Bureau desire to serve *you*.

THE NEW YORK POLYCLINIC

MEDICAL SCHOOL AND HOSPITAL

(Organized 1881)

(The Pioneer Post-Graduate Medical Institution in America)

THORACIC SURGERY

An intensive course. Surgical treatment of chronic suppuration of the lung (pulmonary tuberculosis, abscess of the lung, bronchiectasis) and tumors of the lung. Surgical lesions of the esophagus, heart and diaphragm. Empyemas. Witnessing of operations, cadaver operations, pathologic physiology, experimental surgery and bedside rounds. Indications for surgical treatment, pre-operative care and post-operative management.

PLASTIC REPARATIVE SURGERY

This course includes diagnosis and determination of treatment; pre-operative preparation; anesthesia; operative technique; dressings; post-operative care; with special reference to utilization of the skin and other tissues in correction of disfigurement and replacement of loss, congenital or acquired. Operations on the cadaver. Particular attention is given to lectures, studies and demonstrations of advances in surgical anatomy, pathology, etc., with special reference to the problem actually under consideration.

FOR INFORMATION ADDRESS

MEDICAL EXECUTIVE OFFICER 345 West 50th Street, New York City

SERVICE

In line with our policy of the past several years, we offer you, for your patients, five new and COMPLETE departments as follows:

ARTIFICIAL ARMS AND LEGS
SURGICAL BELTS
SURGICAL CORSETS
ORTHOPEDIC APPLIANCES
ARCH SUPPORTS

All departments managed by competent men and women.

5 REASONS FOR AN AGENCY ACCOUNT

Our Agency Service has five outstanding advantages for anyone having a sizable investment portfolio:

1. It relieves the client of all bookkeeping details and annoying routine.
2. It prevents losses due to mistakes, to delays in depositing dividends and collecting interest, to failure to observe redemption notices, etc.
3. It provides records helpful in preparing tax returns.
4. Its cost is moderate — frequently it pays for itself.
5. Flexible, it is adapted to the client's individual needs and operates under his direct authority.

Mental Effects of "Benzedrine Sulfate."—Molitch and Sullivan (Am. J. Orthopsych., 7:519, October, 1937) report on the mental effects of "Benzedrine Sulfate" (benzyl methyl carbinamine sulfate, S. K. F.).

The New Stanford Achievement Test was given to a group of 96 boys, aged 10 to 17. A week later the same boys took the test again about one and one-half hours after 50 of them had received a 10-milligram "Benzedrine Sulfate" tablet, and the remaining 46 a placebo.

The 46 boys on placebos scored a net loss of 29 points, while the 50 boys on "Benzedrine Sulfate" scored a net gain of 63 points, although 26 of the 50 did not show noticeable improvement. Some weeks later these 26 received 20 milligrams (or double the previous dose) for a third test. Twenty-four of these boys, or 92 per cent, improved their scores with a net gain of 117 points.

The greatest responses were noted in language usage, geography, physiology and hygiene, and arithmetic. Normals of average intelligence and feeble-minded boys responded better than normals of inferior intelligence. Grouped according to academic age, it was found that the boys in junior high school showed greater improvement on "Benzedrine Sulfate" than those in lower grades.

Reactions were mild and transitory, although hypersensitivity to "Benzedrine Sulfate" induced nausea in the cases of the two boys who failed to respond even to the double dose of "Benzedrine Sulfate."

We do not know what lies next in the evolution of public health. Possibly it may be a comprehensive plan whereby all members of society may receive a more equitable distribution of the benefits of medical care, especially among the indigent and low income groups. We do know, however, that the vast majority of our preventable ills are conquerable by the application of such knowledge as we already have. It is not meant to imply that the successive waves of public health evolution have supplanted those preceding, on the contrary, all phases of public health knowledge and practice are necessary in a complete and well-balanced health program.—The Health Officer.

Soon to be released!

THREE NEW MOSBY BOOKS

Management of the SICK INFANT and CHILD

Symptoms of VISCERAL DISEASE

HERNIA—Anatomy, Etiology, Symptoms, Diagnosis, Differential Diagnosis, Prognosis, and the Operative Injection Treatment

ALL BY CALIFORNIA AUTHORITIES

Management of the SICK INFANT and CHILD

By LANGLEY PORTER, Professor of Clinical Pediatrics, University of California Medical School, and WM. E. CARTER, Instructor in Pediatrics, Chief, Pediatric Out-Patient Department, University of California Medical School. New Fifth Edition. 874 pages, 94 illustrations, 3 charts. Price, $10.00.

This new edition is really a new book, entirely reset, printed from new type. Most of the illustrations have been remade and the book has been enlarged to include the Child as well as the Infant. An especially strong chapter has been added on Behavior Problems by the well-known authority, Dr. Olga Bridgman. Among the newer things included in this edition are: Diarrhea, Nutrition, Prematurity, Poliomyelitis, Behavior, Allergy, Syphilis, Tuberculosis, New Therapeutic Agents, Office "Feeding Service," and Well-Baby Clinics. This is essentially a HOW book—telling HOW to do this, that, or the other thing in treating the sick infant and child.

CHAPTER HEADINGS . . .

PART I—*General Considerations.* Vomiting; Diarrhea; Constipation; Hemorrhage; Pain and Tenderness; Convulsions and Syncopes; Fever; Cough; Prematurity.

PART II—Diseases of the Respiratory Tract; Digestive Tract; Heart and Circulation; Blood and Lymphatic System; Nervous System; Behavior; Skin Diseases; Allergy; Genito-urinary Diseases; Diseases of the Osseous System; Internal Secretions; Infectious Diseases.

PART III—*Methods.* Formulas and Recipes; Drugs; Poisoning.

Symptoms of VISCERAL DISEASE

By FRANCIS M. POTTENGER, Medical Director, Pottenger Sanatorium and Clinic for Diseases of the Chest, Monrovia, Calif.; Professor of Clinical Medicine, University of Southern California. New Fifth Edition. 444 pages, 87 illustrations, 10 color plates. Price, $5.00.

A study of the vegetative nervous system in its relationship to clinical medicine. In this new edition Dr. Pottenger has dealt with visceral pain in a separate chapter. He has also added a chapter describing the vegetative centers in the brain and cord which will help to clarify some of the more complicated effects which result from a specific stimulation or a stimulation applied to some definite site in the brain or cord. He has given more emphasis to the endocrines in their relationship to bodily function than in previous editions. Nearly every chapter has been partially or wholly rewritten.

HERNIA

By LEIGH F. WATSON, Member of Staff, California Lutheran and Methodist Hospitals, Los Angeles, Calif. 592 pages, 281 illustrations. Price, $7.50.

A complete treatise on hernia, its diagnosis and treatment. All varieties of abdominal and internal hernias are thoroughly and systematically considered from the standpoint of anatomy, etiology, symptoms, diagnosis, differential diagnosis, prognosis, and the operative and injection treatment. The adoption of the modern injection method for the treatment of certain types of reducible hernia, by many industrial corporations, insurance companies, and state industrial commissions, necessitated the revision of this book.

ORDER THESE NEW BOOKS NOW

Be among the first to get these new books by California authorities. Use the coupon on this page to order these books now. Just as soon as they come from the press your copies will be sent. Like all MOSBY books, these are available to you on terms of $3.00 a month.

The School-Child's Breakfast. — Many a child is scolded for dullness when he should be treated for undernourishment. In hundreds of homes a "continental" breakfast of a roll and coffee is the rule. If, day after day, a child breaks the night's fast of twelve hours on this scant fare, small wonder that he is listless, nervous, or stupid at school. A happy solution to the problem is Pablum, Mead's Cereal cooked and dried. Six times richer than fluid milk in calcium, ten times higher than spinach in iron, and abundant in vitamins B and G, Pablum furnishes protective factors especially needed by the school-child. The ease with which Pablum can be prepared enlists the mother's coöperation in serving a nutritious breakfast. This palatable cereal requires no further cooking and can be prepared simply by adding milk or water of any desired temperature. Its nutritional value is attested in studies by Crimm *et al.*, who found that tuberculous children receiving supplements of Pablum showed greater weight-gain, greater increase in hemoglobin, and higher serum-calcium values than a control group fed farina. Mead Johnson & Company, Evansville, Indiana, will supply reprints on request of physicians.

The more positive knowledge we gain the more we incline to question all that has been received without absolute proof.—O. W. Holmes.

TWENTY-FIVE YEARS AGO

(Continued from Text Page 232)

board of drugless examiners, and a board of registration of religious practitioners." The title of the Act is "To regulate the practice of medicine, surgery, and other systems or modes of treating the sick or afflicted," etc. Thus it is evident that *all who come under it are to do the same things.* But we find that those in the first class must comply with all present requirements and take an examination; those in the second class need have no preliminary education and but two years' study in some school of drugless healing, and in addition the law licenses all osteopaths, chiropractors, naturopaths, and any other breed of drugless healer—in fact, anyone who has joined the "federation of liberal physicians, surgeons, and healers" before July 1, 1913! In the third class, practically no requirements are demanded.

It is to be noticed that every bill introduced, with the exception of the bills noted as prepared by our attorneys, has but one object in view—that is, *the admission to practice medicine in California of persons who could not obtain*

a license in this State under our present moderate requirements. It is also to be noted that our present requirements are much lower than those of several other states.

There seems to be a mad desire on the part of a large number of people to "take a whack" at the sick or afflicted and perhaps it would be a good thing to abolish the law entirely and let everyone treat anyone.

* * *

Medical Education in Europe.—The Carnegie Foundation's report upon Medical Education in the United States and Canada created much excitement, from east to west, because of the disclosures it made concerning the evil conditions of the many proprietary schools extant. . . .

Before beginning the discussion of medical education proper, the book contains a most important chapter—perhaps *the* most important chapter—on the basis of medical education, which is the preliminary training gotten in the secondary schools. . . . Mr. Flexner very properly treats the subject at the length which its importance merits; and in the same way, in a succeeding chapter, he emphasizes the need of the study of the basic sciences, physics, chemistry, and biology, "for the medical sciences are experimental, not merely descriptive, and while even in their descriptive form they cannot be understood without a knowledge of the basic sciences, intelligent experimental study is out of the question to a student who lacks practical skill, brought over from the basic sciences."

* * *

The Educational Value of Moving Pictures.—Since 1910 it has not been an uncommon event at European scientific congresses to witness a display of moving pictures illustrative of physiological phenomena and the life of microscopic human parasites. In this country, with the exception of a few demonstrations made in the East, little attention has been paid to the subject by universities and medical societies.

T. W. Weisenburg of Philadelphia (*Journal of the American Medical Association,* December 28, 1912), in an article entitled "Moving Picture Illustrations in Medicine," draws the attention of the profession to this advance of contemporary science as applied to medicine.

There is no doubt that in the future motion pictures are destined to play an important rôle in the education of the medical student, just as they are today playing a tremendous rôle in the education of the public. The so-called "Nickelodeon," which as a result of the increase in the cost of living may soon be rechristened "Dimeodeon," has certainly done a great deal in the teaching of history, of geography, or art, many of the lessons being easily swallowed and well assimilated in this gelatin-film coated form, whereas these same lessons might not have been at all digested if presented even on a series of so-called lantern slides.

The Edison Company has recently sent out a prospectus announcing the production of a small inexpensive moving picture machine, with small-sized films, and recommended its adoption by universities and medical societies.

From an Article on "Chinese Medicine in America" by Charles Kirkland, M. D., Wei-hsien, China.—Conditions in China as a result of, or in spite of, the native practice of medicine, are bad enough; but it appears that certain wily Celestials are actually trying to introduce their system of medicine into America. It is hard for one not on the ground to tell just how far this propaganda has advanced, but to judge by pamphlets and newspaper articles, it has gained quite a foothold, at least on the Pacific Coast. At any rate, it seems time that the public should know something of the truth about the native pharmacopeia and practice of medicine in China. The writer has no intention of being drawn into a controversy on this subject. A certain wise old medical man (named Oliver Wendell Holmes) once said: "Controversy equalizes fools and wise men, and the fools know it." This adage largely explains why medical men as a class are so slow to enter the lists and appeal to the public prints in defense of what they know to be the truth. It is only in cases of glaring misstatement, with

plausible promises incapable of fulfillment, that the temptation to tell a little truth, if only to relieve the monotony of lies on the subject, becomes irresistible.

From an Article on "Sarcoma of the Uterus" by Emmet Rixford, M. D., San Francisco.—Sarcoma of the womb is commonly regarded as a comparatively rare tumor and as a consequence has received very little attention from clinicians until within recent years. While cases of "recurrent fibroids" had been observed and recorded, and which were doubtless sarcomatous, the first case to be designated sarcoma of the womb was reported by Carl Mayer in 1860, a polypoid sarcoma of the uterine mucous membrane, of which the diagnosis was verified by Virchow.

From an Article on "Some Observations on Symptoms and Treatment of Suppurative Appendicitis" by Robert T. Legge, M. D., McCloud, California.—Subject accepted for a paper before this society has been so often written about and discussed in the past two decades, that I venture to present it with an apology for its staleness.

When we consider, however, that more than one-half of our laparotomies are performed for appendicitis, I think you will appreciate that it behooves us to keep well in touch with the observations and experiences of our leading surgical clinics.

In country hospitals as well as in city charitable institutions the surgeon encounters more suppurative appendicitis than he does in private practice; the reason being, of course, due to delays, improper diagnosis, procrastination, and the so-called medical treatment of cases.

Conclusions:

1. Plea for early operations, no procrastination permissible.
2. In profound septic cases, incision and drainage will suffice as operative means.
3. Proctoclysis only to be used in postoperative treatment.
4. Ideal postoperative treatment is Fowler's position, padlock on mouth, and Murphy's proctoclysis.
5. Temperature is not a reliable guide.

TWENTY-FIVE YEARS AGO

(Continued from Preceding Page)

Sacramento County Society Report.—At a meeting of the Sacramento Society for Medical Improvement, held on January 21, the following officers were elected for the year 1913: G. L. Stevenson, president; F. E. Shaw, secretary; G. L. Stevenson, F. E. Shaw, H. L. Nichols, G. A. White, and W. A. Briggs, directors; F. F. Gundrum, two years; G. C. Simmons, one year; and A. M. Henderson, one year.

State Medical Association: Council's Report for 1912-1913.—All of our accounts, vouchers, canceled checks, etc., since May, 1905, are intact and in the safe deposit; they have all been audited each year by certified public accountants who are responsible for the accuracy of their audit. In this statement we have not gone into many burdensome details, but it may be said that no matter of expense has been undertaken without consideration and sanction by the Council, and that not a dollar of money has been paid out until after the charge has been investigated and approved in writing by the auditing committee of the Council.

Year	Receipts	Expenses	Gain	Loss
1905	$ 8,791.34	$ 8,524.40	$ 266.94	
1906	10,634.99	11,085.55		$ 450.56

				$3,830.09

(Signed): C. G. Kenyon,
Chairman of the Council.
Philip Mills Jones,
Secretary.

From Some News Notes from Newspapers:

The German Hospital, San Francisco, has been sued for $25,000 because of the death of a boy from rabies.

Oakland supervisors—or rather, Alameda county supervisors—have allotted one million dollars for the new county infirmary.

San Diego County Medical Society had its annual dinner on January 16, and the older resident physicians recited their hard-luck stories of early days.

The Good Samaritan Association has purchased the Columbia Hospital at Los Angeles, and thus enlarged its usefulness materially. It is an Episcopalian institution.

On January 31 there were 862 patients in the Los Angeles County Hospital, and it is stated that within a year the new hospital building will be inadequate to accommodate the patients that will have to be cared for.

The bill requiring a medical certificate before a marriage license is issued is creating a good deal of discussion at Sacramento, and the newspapers comment upon the frankness of the language used; it would be well if the papers would be as frank.

An outrageous suit has been filed against Dr. E. R. Bryant, San Francisco, because he did not respond to a call to attend a former patient when he, himself, was ill. This would look like plain blackmail and, of course, he will win the suit if it is ever tried.

The physician can perhaps make his greatest contribution to a child health problem when the public is educated to the need of having children examined regularly once, or better twice, a year, even in the absence of symptoms of disease. Many mothers bring their babies to the physician regularly for inspection and health advice, and school children receive at least a certain amount of attention. But in the ages between, very little is done, with the result that large numbers of children enter school at the age of six with various defects, many far advanced. The public does more in this kind of prevention dentally than medically, which indicates what can be accomplished by the proper sort of education.

A Margin of Safety[1]—Plus[2]

VITAMIN A
2000 U. S. P. Units added to each Tall Can (13 Fl. Oz.)

VITAMIN D
400 U. S. P. Units added to each Tall Can (13 Fl. Oz.)

[1] *From Journal AMA, 108:206 (Jan. 16, 1937):*

REQUIREMENTS AND ALLOWABLE CLAIMS FOR VITAMIN D MILK:

To be acceptable to the Council on Foods, bottle caps and labels for Vitamin D milks must declare unitage of the vitamin D in terms of U. S. P. units and the source of the vitamin D, unless local government regulations prohibit such declarations.

For all milks containing a minimum of 135 units, an enhanced nutritive value, especially for growing children, may be claimed; it is also permissible to state that these milks usually will prevent clinical rickets when they are fed to normal infants in customary quantities.

For milk with only 135 units to the quart there shall be no claim or intimation that an adequate amount of vitamin D is being supplied to infants. When the milk contains as much as 400 units to the quart, the claim may be made that the amount of vitamin D is greater than that usually required for the prevention of rickets in normal infants and thus that a margin of safety is offered when customary amounts of milk are taken.

The foregoing statements which have been made concerning vitamin D in fresh milk apply equally to evaporated milk after it has been diluted with an equal volume of water.

[2] Special Morning Milk contains 496 U.S.P. units of Vitamin D per reconstituted quart (16 fluid ounces of milk and 16 fluid ounces of water). Thus Special Morning Milk has an additional margin over "a margin of safety" of 96 units of Vitamin D per reconstituted quart or approximately 24%.

- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA USING COD LIVER OIL CONCENTRATE AS ITS SOURCE OF VITAMIN D.
- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA TO WHICH HAS BEEN ADDED 400 U.S.P. UNITS PER TALL (13 FLUID OZ.) CAN.
- THE VITAMIN D ADDED TO SPECIAL MORNING MILK REPRESENTS THE AMOUNT IN 1¼ TEASPOONS OF U.S.P. COD LIVER OIL (315 UNITS PER TEASPOON).

No Cod Liver Oil taste in the Milk!

practiced medicine while holding only the chiropractor's license. The charge was sworn to by Inspector Ronan of the State Medical Board. . . . The state inspector charges that the chiropractor prescribed medicine while not possessing a license. . . . It is claimed by the defendant chiropractor that the 'medicine' the State charges he prescribed was only a substance containing vitamins." (Riverside *News*, January 20, 1938.)

"The House Immigration Committee yesterday approved a bill to cancel deportation orders issued against Dr. Filiberto A. Bonaventura, a Santa Rosa, California, physician. The orders had been issued against Bonaventura, a native of Italy, as the result of a narcotic law conviction in 1932 in Ohio. The offense, however, was declared to have occurred in 1930, while the Immigration Act under which deportation orders were issued was passed on February 18, 1931." (Associated Press dispatch, dated Washington, January 26, 1938, and printed in the Sacramento *Bee* on the same date.)

"Dr. Allen F. Gillihan, county health officer, on Monday tendered his resignation to the board of supervisors, because of ill health. The resignation, which asked that the officer be relieved of his duties on March 1, was accepted with the proviso that Doctor Gillihan remain at his post until a successor could be found. Members of the board expressed regret that the physician's health compelled him to give up the supervision of the department, and gave high praise for his conduct of his office, declaring that the county department was one of the most efficient in California. . . ." (San Luis Obispo *Telegram*, January 18, 1938.)

"News dispatches from Tampa say the Florida State Board of Medical Examiners refused to consider the application to practice medicine of Dr. William Loesner of Chicago, on the ground he was the physician who performed the face lifting and identification mark removing operations on Charles Dillinger. The board is right, and should receive the praise of physicians and laymen everywhere. If such acts do not, as the board argued, violate 'the ethics of the medical profession,' what could? The physician debases his profession who becomes the active aid of a Dillinger, assisting the enemies of society. Such a physician should be denied the right to practice medicine in Florida or any other state." (Editorial, Sacramento Bee, January 21, 1938.)

"A surprise move by the prosecution for dismissal of a felony charge against 'Dr.' Richard J. Howard, Hacienda rancher, who was scheduled to go to trial in the Sonoma County Superior Court next Monday, and William Patrick Devine, twenty-six, former employee of Howard, was granted on Friday by Judge Donald Geary. Grounds of insufficient evidence of conspiracy was given by Deputy District Attorney Les Manker for the move. Prospective jurors had already been summoned. Howard is now awaiting trial in the Healdsburg justice court on misdemeanor charges of violating the State Medical Practice Act. The conspiracy charge was based on a similar allegation, accusing Howard and Devine of conspiring to treat one Thomas White for cancer." (Petaluma *Argus-Courier*, January 15, 1938.) (Previous entries, December, 1929; June, 1932.)

"Charges four years old against Dr. M. M. Doria of having attempted to shoot R. I. Rasmussen and of having stabbed Mrs. Nettie Rasmussen, parents of Olive Rasmussen, eighteen, whom he afterward married, were dismissed in municipal court today at request of the Rasmussens. District Attorney Thomas Whelan agreed to the motion for dismissal. One complaint, drawn up in 1933, when the alleged acts were committed, listed Rasmussen as complaining that Doria drew a pistol and fired, the

bullet striking the floor, when the parents objected to their daughter accompanying the elderly physician December 21 of that year. . . . The other complaint charged that on December 26, 1933, when Mrs. Rasmussen, accompanied by Olive, called upon Doria in his office in the Watts building, to remonstrate with him, the older woman was stabbed in the shoulder with a small surgeon's knife. Doria fled across the border subsequently and avoided arrest, Whelan said. On April 7, 1934, the physician and Miss Rasmussen were married. . . ." (San Diego *Tribune*, January 7, 1938.) (Former entries, February and July, 1934.)

"An initiative measure, aimed at revolutionizing the medical profession, has just been granted a title by the office of Attorney-General U. S. Webb at the request of M. James McGranaghan of San Francisco, who is seeking to obtain enough signatures to place the measure on the ballot at the general election next November 8. The measure would provide penalties for unnecessary major operations, require prescriptions to be written in English, and 'create a conclusive presumption of unskillfulness if a surgeon has less than five hundred hours of surgical training or has participated in less than fifty major operations.' The measure would also re-

(Continued on Page 22)

Why RY-KRISP is a natural corrective for *Common Constipation*

Doctors are finding Ry-Krisp Whole Rye Wafers a natural aid for correcting common constipation due to insufficient bulk for reasons which are obvious when you consider that...

RY-KRISP is simply whole rye, salt and water—*double baked* for brittle crispness. As such a food it has a high percentage of bran, high pentosan and crude fibre content to encourage normal bowel action. Moreover, each wafer absorbs five times its own weight in water, thus producing needed bulk to stimulate natural peristaltic action.

RY-KRISP involves no unpleasant dosage to be avoided or postponed. Instead it offers the tempting, crunchy goodness of a *natural,* delicious food—so good with any meal that patients gladly eat it regularly. Results are dependable, predictable, natural. For that reason alone it is immeasurably valuable to school children, to busy men and women tied down with daily routine.

For free samples and the Research Laboratory Report on Ry-Krisp use the coupon below.

define the practice of medicine." (San Fernando *Sun*, January 4, 1938.)

"An unidentified San Diego mother, whose name is being withheld by authorities, was near death in Quintard Hospital today, and Dr. E. Blanche Ramer, fifty-seven, was charged with performing an illegal operation upon her. According to Thomas Frost, Investigator for the District Attorney, hospital authorities hold 'little chance' for recovery of the woman, mother of two children. . . . Doctor Ramer, her attorney said, was to be arraigned in municipal court today. She was arrested on a warrant charging her with performing the alleged illegal operation. . . . Her license was revoked several months ago by the State Board of Medical Examiners, but since that time her attorney has obtained a temporary restraining order blocking the revocation. . . . Doctor Ramer denied any knowledge of the charges against her, according to Frost." (San Diego *Sun*, January 12, 1938.)

"Murder was charged yesterday against Dr. Blanche Ramer, San Diego physician, following the death of Mrs. Monte Beck, thirty-seven, victim of an alleged illegal operation. . . . Mrs. Beck, mother of two children, and employed as a department store saleswoman, is alleged to have submitted to the operation last December 4 and died yesterday at Quintard Hospital, where she was taken on December 20." (San Diego *Union*, January 15, 1938.)

"With the knowledge that truth is often much stranger than fiction, Warner Bros. are going to the daily newspapers for material for several pictures which are apt to prove veritable sensations as well as accomplish a lot of good. They are planning to expose, through the powerful medium of motion pictures, different racketeers who have

Cosmetics and Your Patient's Morale

THE DOCTOR IS OF NECESSITY A STUDENT OF LIFE. Each new patient presents a new study, a new problem. Psychology plays an important role in the course of treatment he prescribes. With some patients he must be frank to a point of harshness, with others he must be gentle and coaxing. The nature of the illness and, more particularly, the nature of the patient determine his attitude. He knows from experience the value of bolstering his patient's morale. As a student of psychology he knows that few things are more depressing to a woman than the fear that she is losing her charm, that when she no longer cares how she looks the chances are she has lost touch with a vital interest in life. And because he appreciates the importance of a sensible interest in personal appearance he quite rightly encourages his patients to look their best at all times. FINE COSMETICS appeal to that interest. That is why they deserve to be recommended by doctors who are, after all, greatly concerned with their patient's morale.

LUZIER'S, INC., MAKERS OF FINE COSMETICS & PERFUMES

KANSAS CITY, MO.

fastened their tentacles on the general public. Probably foremost among these human vultures are quack doctors. To insure truth in every phase of the production, the cooperation of Dr. Morris Fishbein, editor of the *Journal of the American Medical Association,* has been enlisted. Another group which will be exposed is the world-wide one that deals in the insidious drug traffic. And a third group are the shyster lawyers, who render it difficult for honest district attorneys to enforce the law against criminal offenders." (San Jose *Mercury-Herald,* January 16, 1938.)

"Negligent use of the drug dinitrophenol, which, she asserts, caused her to go blind, is charged in the petition of a suit for $28,000 damages filed late yesterday in the Superior Court by Helen M. Reed against a physician, a druggist, and others." (Los Angeles *Times,* January 14, 1938.)

"At a cost of $350,000, a new Hahnemann hospital will be erected this year, according to plans being perfected yesterday by a committee headed by Marshal Hale. The hospital, to contain eighty beds and provision for expansion, will be located on the California and Maple streets site occupied by the old Hahnemann Hospital for twenty-five years. The old building was razed in 1930. The new hospital, sponsored by the Homeopathic Foundation of California, will be open to all physicians. . . . John L. McNab and John M. Grant, with Hale, make up the Executive Committee. . . . A campaign committee, including prominent professional and business men, is aiding the Executive Committee. . . . Dr. James W. Ward of San Francisco, regarded as the dean of the homeopathic profession, has given his extensive library to the Homeopathic Foundation and it will be housed in the new auditorium-library of the new hospital, the committee announced." (San Francisco *Examiner,* January 15, 1938.)

"Selection of a jury was begun today in Superior Judge Frank M. Smith's court, to try Dr. W. B. Humphrey, a physician, and Louis Feinstein, an attorney, on charges growing out of an investigation last year by a jury into the operation of a so-called 'fake accident' ring. . . ." (Los Angeles *Herald and Express,* January 24, 1938.)

"Oakland's beauty shop insurance fraud cases ended officially yesterday when Superior Judge Lincoln S. Church sentenced the two defendants, one of whom leaped up and protested bitterly. He was Emil Grossman, Oakland attorney, whom the court styled the 'arch conspirator' in the plot, and who was committed to San Quentin for a term of one to ten years on charges of fraud, conspiracy, and grand theft. 'I should get the same consideration as Judge George Hickman,' Grossman shouted. (Hickman was convicted of extortion from café owners in a license-fixing case, served about a year in jail and is now at liberty pending an appeal.) 'His crime was worse than mine, but you are sending me to San Quentin.' Judge Church ignored the outburst. The second defendant, Dr. Louis Kameny of Oakland, was sentenced to a year in jail, with three years' probation. Both men were accused of plotting with Mrs. Adrienne Udstone to commit an insurance fraud. The woman, who was acquitted, supposedly was burned in a beauty shop. The plan was to have the shop operator take out a policy for protection against such accidents, then collect." (San Francisco *Examiner,* January 21, 1938.)

Henry H. Rogers is reported to have pleaded guilty to a violation of the Business and Professions Code in Los Angeles and to have been sentenced to 180 days in the city jail, sentence suspended on condition he leave the State within forty-eight hours and not return for two years.

Investigation reports show Samuel D. Collins was recently denied probation, after being found guilty by a jury of violation of the Business and Professions Code, where-

upon he was sentenced to serve ninety days in the city jail, forty-five days being suspended, and he was committed.

Records show that on December 20 Harry T. Bottrell pleaded guilty in Los Angeles on a charge of violation of the Medical Practice Act and on December 20 was sentenced to serve 180 days in the city jail, suspended two years on condition he leave the United States within thirty days.

The Los Angeles *Daily Journal*, Friday, December 31, 1937, related that the Appellate Division of the Los Angeles Superior Court ruled that "Opticians employed by the Kindy Optical Company are not permitted to adjust glasses on the person for whom they have been prescribed."

The danger of fumigating with methyl bromid was mentioned in a December, 1937, report of the Department of Industrial Relations to the Governor's Council, in the following language: "Recently in California two men were fumigating a house and as the result of the exposure to this fumigant one man died and the other man, although he was made very sick, appears to be all right at this time."

Individual Responsibility for Health.—Public health provides a service to the community. In the early stages of its administration as a governmental unit, public health was concerned chiefly with environmental factors that had to do with the promotion of community health. Sewage disposal, water and milk supplies, fly and mosquito control and general sanitation were the supporting pillars in every community health program. They still uphold most of the structure, but during recent years more widespread and intensive activities that have to do with the individual citizen have been developed. Of these, immunization against smallpox, diphtheria, and typhoid fever has been, and still is, most important. Many other personal attributes provided through services to the individual have been added to the general health program as practiced in the average community. Among them are prenatal service, child care, dental hygiene, pneumonia control, educational and other services that require application of recognized methods of procedure at the hands of trained workers.

While this type of activity seems to be in the form of grants to the individual it is actually the provision of a service that helps people to do things for themselves. It requires action upon the part of the individual and demands continued activity in order to achieve results. Of this Surgeon-General Parran of the United States Public Health Service has said:

"Public health today consists of helping people to do things for themselves. The pregnant woman should seek medical care early. The mother must know the essentials of proper feeding and care of her baby and avail herself of the protective inoculations against such diseases as diphtheria and smallpox. The school child must be taught good health habits. The pneumonia patient must call the doctor early in order that serum may be of value. Regular examinations, including x-rays when necessary, make it possible for tuberculosis to be discovered in its curable stages. The only hope of cure from cancer is similarly citizen interest, knowledge, and participation in finding the disease and securing proper treatment."

The natural tendency among scientists to carry any new theory or practice to extremes has not been discouraged by the manufacturers of biological products, so that the virtues of immunization in many lines have been greatly overrated, under pressure of commercial interests. While this wave is by no means spent, it is believed that its crest has passed, and that immunization will in the future be regarded more in the light of its true rather than inflated values.—The Health Officer.

Every Product Exhaustively TESTED!

Physicians must have preparations whose ingredients and efficacy are of unquestioned value. The steady growth of the Smith-Dorsey Company from 1908 is the best indication that our products measure up to these requirements.

PHARMACEUTICALS
YOU CAN PRESCRIBE WITH CONFIDENCE

Every Smith-Dorsey product is safeguarded in three ways:

1. We operate a control laboratory for the purpose of testing raw materials for purity.
2. Finished products are thoroughly tested for conformity to label statements.
3. No new products are released without subjecting them to physiological tests.

Our laboratory is modern and complete and is manned by competent university trained chemists. No expense is spared to make research complete. No preparations are ever offered the laity.

Such is the background of Smith-Dorsey products.

THE SMITH-DORSEY COMPANY, LINCOLN, NEBRASKA
FOUNDED 1908

Dentistry in Public Health.—It has long been recognized by the medical profession and health officials that the dentist is playing a very important part in public health work. When it is known that many systemic diseases can be traced directly to mouth conditions, it then becomes imperative for a community to become more mouth conscious, and it is with that thought in mind that the Bureau of Dental Hygiene of the State Department of Health is functioning in coöperation with the Health Commissioners, school officials, parent-teachers, civic clubs, and all other organizations interested in health in presenting public health to the people from a dental standpoint. It being known that the mouth, affording an ideal culture media for bacteria, has practically every known bacteria present at all times, and if the mouth is not kept as clean as is humanly possible the danger of carrying infection throughout the system by means of the blood stream is greatly enhanced.

The dentist should play a very important part in the teaching of the children and parents the importance of preserving and retaining the deciduous or baby teeth until time for their natural loss. Many malformations in later life can be traced to the too early loss of the deciduous teeth. A child cannot expect to grow into strong healthy manhood or womanhood without proper nutrition and care and the nutrition cannot be properly attained without a full complement of teeth, since the first steps of digestion begin in the mouth. If there is a loss of one of the members of mastication, either deciduous or permanent, one is quite naturally throwing more work upon the organs of the body to attain the height of digestion. It is appalling to know in our work, from the State Department of Health, that dental conditions lead the field in defects of children in all communities and here the dentist can play a very important part in getting the proper knowledge to the parents of these children as to the importance of retaining those teeth.

In our work of general surveys we find that much neglect is noted and not in all instances due to lack of funds, but in a great many cases the feeling is to extract the tooth and finally replace with false teeth. Here, also, the dentist can be honest with his patient and tell them that no restoration is ever so good as the natural tooth.

Purchasing Milk Intelligently.—Every morning thirty million bottles of milk are left on the doorsteps of America. Practically every citizen is a purchaser and consumer of the products of the great milk industry, and all should know a few of the essentials to be taken into consideration when selecting a source of supply for home consumption. These are purity, nutritive value, taste and odor, delivery service, budget wisdom, and company reputation.

While milk is, beyond doubt, a good food for human beings it is also a good culture ground for germs. Harmless and dangerous germs grow in it equally well. They may come from diseased cows or from diseased people. The diseases usually transmitted from infected animals are tuberculosis, undulant fever and septic sore throat, and milk contaminated by man may transmit typhoid fever, scarlet fever, diphtheria, dysentery, and diarrhea.

How is the consumer to know of the sanitary quality of the milk purchased? It has long been the practice of enthusiastic route salesmen to say, "The milk of the John Doe dairy is tested," as a part of the sales talk. In itself, that means nothing unless it is known who performed the tests, how they were conducted and just what were the results.

It is the duty of a health department to supervise the production and pasteurization of milk, and this includes inspection of buildings, equipment and handling, plus a bacterial examination of the milk itself. Many health departments do these things; many do not.

When they are done adequately the problem of the consumer's difficulty in selecting a source of supply is solved by placing a grade designation on the bottle cap. If the milk is of good sanitary quality the health department grants this dairy permission to label bottle caps Grade A. This means, in effect, that it is the best milk obtainable and is recommended for use. A consumer's support of a health department's decisions is a most important factor

"To Greater Vision . . ."

Year after year men of science have striven to perfect examination of the eye, that greater precision in diagnosis might be obtained. Throughout those years every avenue of research has been explored—procedures of precision manufacture have been developed so that in modern ophthalmic instruments the practitioner might find the means of accurate diagnosis and correction.

The result of this painstaking effort is embodied in Bausch & Lomb ophthalmic instruments. In every stage of their development has been considered the need of the modern practitioner and throughout their design and manufacture is reflected the high scientific integrity of the country's outstanding manufacturers of ophthalmic instruments.

in an attempt to secure and maintain a safe milk supply. Suppose a distributor should leave a bottle of milk labeled Grade C at a home accustomed to receiving Grade A. This would be proof that this dairy has violated some important item of sanitation which the health department has discovered and that the milk is not of the usual quality, and, in fact, is potentially dangerous. The purchaser should immediately get in touch with the dairyman and ask for an explanation of the lowered grade. The possible loss of a customer will certainly supply this dairyman with an impetus to correct the insanitary condition that has caused the grade to be lowered. The health department by its action has tried to protect the consumer and his family and the consumer by taking this procedure is assisting the health department in community protection.

Milk provides almost every type of food element required by the human body, and so should be regarded as the most important single food. Its protein content aids growth and repair, the fat and sugar supply energy and warmth, its phosphorus and calcium are essential elements in nerves and bones. It contains vitamins A, B, C, D, and E in varying proportions, and these vitamins promote growth, furnish resistance to infection, aid digestion, stimulate appetite, strengthen the nervous system, build strong nerves and teeth and prevent and cure scurvy, rickets, and pellagra.

Flavor and odor are considerations in selecting a milk supply. An off-taste or peculiar odor of milk may be due to the physical condition of the animals, to feeding practices, exposure to certain metals, or to improper sanitation.

Delivery service can, of course, be readily ascertained by the prospective consumer. When possible, the time of delivery should be so arranged that the milk is promptly removed from porch to house, or, if not, a receptacle that is covered and insulated should be provided for its reception. Something should be known, too, about the transportation of the supply; if the milk is protected against extremes of temperature and if the truck is covered and clean.

The appearance of the bottle of milk should not be overlooked. A clean shiny bottle of milk, showing a reason-

"I had not realized, Doctor, what a great difference a central location could make until I moved" — to the

BUTLER BUILDING

When your location is *right,* when your offices are spacious and well-lighted (as in the Butler Building), when the building is handsomely appointed, with up-to-the-minute elevator facilities (this building has all these), you surely will find, too, "what a great difference a central location can make."

Call at the building—corner of Geary and Stockton Streets—at Union Square—and look over the offices, single or in suite, now available. Or call on—

Buckbee Thorne & Co.

151 SUTTER STREET, SAN FRANCISCO

able cream line and a protected pouring lip is decidedly desirable.

Budget wisdom is an element frequently neglected by the purchaser. It is estimated that dairy products frequently constitute from 18 to 20 per cent of the total expenditure for food in the average American diet. Doctor Sherman, an expert on nutrition, states that food expenditure should be: Meat and fish, 12 per cent; milk and its products, 44 per cent; bread and cereals, 13 per cent; vegetables and fruits, 17 per cent; eggs, 6 per cent; sugar, 3 per cent; miscellaneous, 5 per cent.

A quart of milk supplies almost as much energy as a pound of steak, and about twice as much as a pound of chicken; it supplies nearly three-fourths the amount of calories needed by a year-old child; one-third that required by a boy of ten; and one-fourth the amount required by the average man or woman. All authorities agree that a growing child should have at least one quart of milk a day and that adults should drink at least a pint. Price comparisons considered, milk is the cheapest and best of all foods.

Company reputation is more important in the milk industry than in many other major industries, because not only is the product a most perishable one, but, if sharp practices are tolerated or attempted, the result may be extremely dangerous to the consumer. So it should always be the policy of the purchaser to ascertain if the dairy from which milk is supplied is content to put out a product that will merely "get by" or one that is maintained at a high standard.

Visual Standards for Licensure to Operate Motor Vehicles.*—In 1925 a report on visual standards for operating motor vehicles was submitted to the Section on Ophthalmology and approved by the House of Delegates of the American Medical Association. There were embodied in this report, first, recommendations of minimum visual requirements, and, second, that under certain conditions applicants with less than this minimum be qualified by special or county boards of licensure. The report further recommended: "In each state there shall be a board of physical licensure in each county, or one for several counties, consisting of two general practitioners or surgeons and one ophthalmologist." The second part of this submitted recommendation proved to be impracticable and therefore has not been embodied in law or in practice. The general purpose of this recommendation was to provide a certain degree of flexibility in the administration of the suggested visual requirements. For it was, and still is, generally agreed, on the one hand in the interest of greater safety and on the other of justice to some, that standards of good vision which are necessary for efficient operation of a motor vehicle cannot be arbitrarily fixed since the problem of safety depends on other factors as well; for example, the driver's natural aptitude, experience, and general mental and physical fitness. The lack of good vision may be compensated for by a high degree of efficiency in these other factors. But the appalling increase in the number of serious automobile accidents compels the further attention of all those interested in public welfare to study the problem of accident prevention.

During the year 1936, 38,500 deaths were due to traffic accidents, 110,000 persons were permanently injured and 1,230,000 were temporarily injured. With ever increasing numbers of automobiles in use and with increasing speed, the safety of the public demands the elimination of preventable accidents.

One study of the data relating to the cause of automobile accidents shows that the driver alone was responsible for three out of five accidents. Faulty mechanism was responsible for about 1 per cent. Condition of roadway, weather, traffic and, foremost of all, speed were responsible or contributed to motor vehicle accidents. In nearly all types of accidents, except faulty mechanism, all investigators agree that physical or mental defects of the driver have a part, good vision being of paramount importance. Since the driver alone is responsible for the major propor-

APPROVED CLINICAL PATHOLOGISTS

American Medical Association Essentials for An Approved Clinical Pathologist

An approved clinical pathologist should be a licensed graduate of medicine. He shall have specialized in clinical pathology, bacteriology, pathology, chemistry, and other allied subjects for at least three years, and he should be reasonably familiar with the manifestations of disease in the body. The director of a clinical laboratory shall be on full time or have definite hours of attendance, devoting the major part of his time to this specialty. A clinical laboratory is an institution organized for the practical application of the fundamental sciences by the use of specialized apparatus, equipment and methods, for the purpose of ascertaining the presence, nature, source, and progress of disease in the human body.

The following Clinical Pathologists directing private laboratories in California are approved by the Council on Medical Education and Hospitals of the American Medical Association:

Clinical Laboratory of Drs. W. V. Brem, A. H. Zeiler, Roy W. Hammack and G. D. Maner, 657 So. Westlake Avenue, Los Angeles, California.

Zera E. Bolin, M. D., 490 Post Street, San Francisco, California.

These laboratories use standard methods and are fully equipped to make all clinical examinations of recognized value in: **Tissue Pathology, Bacteriology, Hematology, Serology, Bio-Chemistry, Kolmer, Wassermann, Kahn test, Medico-legal, Basal metabolism, Blood chemistry, Hormone Test for Pregnancy, Parasitology, Cardiology, Autogenous vaccines, etc.**

Mailing containers sent on request. Special delivery postage insures prompt, accurate service.

THE POTTENGER SANATORIUM AND CLINIC

For Diseases of the Chest — **Monrovia, California**

AN INSTITUTION FOR DIAGNOSIS AND THERAPY

CHOICE rooms and bungalows at rates ranging from $35 per week up, including medical service, general nursing, x-rays, routine laboratory examinations, ordinary medicines and therapeutic pneumothorax.

A few accommodations as low as $25 per week assigned on special application in selected cases.

In the foothills of the Sierra Madre Mountains, thirty-five miles from the ocean. Surrounded by beautiful gardens.

Close medical supervision. Aside from tuberculosis, special attention is given to asthma, bronchiectasis, lung abscess and kindred diseases.

For particulars address:

THE POTTENGER SANATORIUM AND CLINIC, Monrovia, California

(Continued from Preceding Page)

tion of motor vehicle accidents, the problem facing the medical profession is fundamentally the establishment of practical methods by which to determine or measure the driver's ability to operate a motor vehicle.

The Section on Ophthalmology is interested in the visual phase of this problem, but this is necessarily complex. The visual function cannot be separated from the physical and mental, and a high degree of coördination of all these is most important to the skilful and safe operation of an automobile. The measure of good vision alone does not measure the driver's ability to interpret and to act on what is seen. However, good vision is essential in order to obtain the transmission of proper sensory impressions to these other essential functions.

To determine visual standards which are adequate to a greater degree of safety in operating motor vehicles, your committee has consulted the following for suggestions and advice: Council of State Governments, National Safety Council, American Automobile Association, National Society for the Prevention of Blindness, Bureal of Legal Medicine of the American Medical Association, United States Department of Commerce, National Bureau of Standards, National Research Council, and many students of traffic problems.

After consideration of the many phases of this problem, we submit the following recommendations:

1. *Bureaus of licensure shall be established in every state, and in as many subdivisions thereof as may be necessary.*

 (*a*) A license shall be issued to each individual only after determining the applicant's ability to operate a motor vehicle.

 (*b*) To test this ability actual road tests shall be made by legally appointed lay persons who shall be trained

SELF-PORTRAIT

OF MANY BUSINESS MEN

MANY a business man pictures himself as a sort of modern Atlas—supporting the fate of the world on his shoulders.

He sincerely regards his work as indispensable to the success of the business, and recoils from anything that he feels might take him away from his job.

That's why it usually is so difficult to get such a man to pay proper attention to his health, even though he is troubled by persistent signs and warnings that something is wrong.

For at any suggestion that he heed these warnings—that he see his doctor—he says: "Yes, yes, I suppose you're right. But what if the doctor should order me to stop work for awhile? Who'd take care of my job? What would happen to the business?"

And the irony of it is that by his attitude he is inviting the very thing he fears! For one of the surest ways of encouraging a *serious* sickness is to neglect a seemingly *small* one. Heart and other organic diseases, stomach ulcers, and nervous disorders—diseases to which men in the so-called "prime of life" are particularly susceptible—thrive on neglect.

When you see your doctor he may, to be sure, prescribe a short rest. But isn't that better than a *forced long* rest later? He might say: "Take things a little easy. Leave the office an hour earlier at night." But isn't that better than driving on relentlessly until you're *carried* out of the office?

Let us hope, of course, that your disturbance will turn out to be a minor one—and that its treatment will be simple, its correction rapid. But whatever is wrong, you'll be better off if you start correcting it before it becomes really serious. The most sensible thing you can do, therefore, is to see your doctor *now*.

DISCIPLINARY CODES OF MEDICAL SOCIETIES

Medical Society Membership as a Vested Right.—It has taken medical societies a long time to learn the important fact that, once a physician is admitted to membership in a county medical society, he becomes possessed of rights and privileges that can be taken from him only if charges are properly filed against him, and even then, only after a fair trial, during which all his legal and other rights have been meticulously safeguarded. If such procedures were lax and these fundamental rules were not observed, and if, subsequently, disciplinary action, in the form of censure, suspension or expulsion was carried out, then such a member would have the right to turn to the civil courts and there give a society, its officers and members an unhappy and, perhaps, rather an expensive experience.

* * *

Disciplinary Code of the California Medical Association.—County medical associations in California, and in other states, despite the belief of their officers that they were proceeding properly, have had, in a number of instances, just such unpleasant subsequent awakenings; and that is why a new disciplinary code of the California Medical Association (outlined in its by-laws, under Chapter II—Membership) was adopted several years ago. Great as was the improvement so effected, later experiences have indicated that even these new rules could be clarified.

* * *

"Disciplinary Procedure" Recently Adopted by the Los Angeles County Medical Association.—Attention having been called thereto by the chairman of one of its committees, Dr. Lowell S. Goin, the Council of the Los Angeles County Medical Association instructed his committee to outline a "Procedure in Disciplinary Actions," to be used in the future as its sole guide. The committee's report, as adopted by the Los Angeles Council on February 7, 1938, appears below, and its perusal and consideration are recommended to all component county units of the California Medical Association.

† Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

Disciplinary Action Must Be Based on By-Laws: "Resolutions" Are Inadequate.—In connection with this subject of disciplinary action, it may be well to remind every county medical society that no member can be legally subjected to discipline (censure, suspension or expulsion) because of violation of a "resolution" that may have been adopted at some previous meeting. A "resolution" may state that conduct of a certain nature is "disapproved" by the society, but membership can be taken away only after it has been shown, in a fair trial, that a member has violated the constitution and by-laws of a society. Nor is a "resolution" a by-law. When in doubt on these matters, component county societies are advised to write to the central office of the State Association requesting that the opinion of its legal counsel may be given, before any active steps for a member's trial are instituted. The importance of caution and care in all these matters can hardly be overemphasized.

* * *

A County Society Is the Sole and Absolute Judge on Qualifications of Applicants.—An equally important fact to keep in mind is this, that each component county society is sole judge of the qualifications of physicians whom it admits to membership. If the application of a physician is rejected by a county medical society, when it has acted in accordance with its constitution and by-laws, that judgment of rejection stands, and there can be no appeal to a higher body, such as the state or national associations; nor need a subsequent application from such a rejected member be considered, except as the county society, according to its own constitution and by-laws, may see fit to grant that privilege.

* * *

Quality Precedes Quantity in County Society Membership.—In California, there are a goodly number of physicians not members, yet who are apparently eligible to membership in their respective county societies, and it is proper that dignified efforts should be made to secure the affiliation of such colleagues. On the other hand, among nonmembers are physicians whose records and past or present affiliations give just cause for hesitancy in so important a matter as that of granting membership. Here the old policy, "When in doubt, wait, consider, and reconsider," aptly applies. For, as stated in the beginning of these comments, such physicians, once they are members, become vested with certain legal rights, to divest them of which is no easy or agreeable task. Here, also, "An ounce of prevention is worth a pound of cure."

* * *

The Text of the Recently Adopted Los Angeles County Disciplinary Procedures.—Because of the great importance of all these matters, the procedures recently adopted by the Los Angeles County Medical Association follow:

(COPY)

PROCEDURE IN DISCIPLINARY ACTIONS

Procedure to Be Followed in Citing a Member to Trial Is Presented in the Following Report of a Special Committee: Report Adopted by the Council of the Los Angeles County Medical Association on February 7, 1938

I. *Most complaints when received could be referred to the Committee on Professional Conduct* without any action on the part of the Council; and your committee recommends that the Secretary of the Association be authorized and instructed to use his discretion as to such reference; the Secretary to be further directed to report all such complaints to the Council whether they are referred to the Committee on Professional Conduct or not.

* * *

II. *On conclusion of its investigation of any complaint, no matter how received, the committee has two courses:*

(1) It may recommend no action.

(2) It may recommend citation of the respondent.

(*a*) It should be, and the committee recommends that it become, the duty of the committee to secure a sworn affidavit as to the matters complained of, if the complaint is made by a nonmember of this Association.

The complaint should first be reduced to a concise statement by the committee and thereafter sworn to by the complainant.

If the accusation is by a member of the Association, he should sign the complaint (but not the charges).

(*b*) On the basis of the signed statement by a member or an affidavit by a nonmember, formal charges should then be prepared by the committee and signed by them as a committee.

This forms a sort of indictment and serves two purposes:

(1) It removes the personal element present when A accuses B, substituting therefor an impersonal action by a committee engaged in the performance of its duties.

(2) It changes the nature of the charges from a biased accusation to a calm statement that the ascertained facts are such as warrant their evaluation by the Council.

* * *

III. *The form of the charges should be as follows:*

To the Council of the Los Angeles County Medical Association: Attention, Dr. ———, Secretary.

We, the Committee on Professional Conduct of the Los Angeles County Medical Association, having investigated the ———, hereby charge as follows: that ——— (member, or members) of the Los Angeles County Medical Association, has violated ———.

Said Section —— reads as follows: ———.

Your committee bases these charges upon the following information disclosed by its investigation heretofore referred to: ———

That your committee is informed and believes and therefore charges: ———.

Your committee believes that the foregoing acts and conduct on the part of said ——— constitute violations by said ——— of the section of the ——— (here insert by-laws or Principle of Medical Ethics, as the case may be) which has been previously mentioned herein. Your committee believes that the alleged acts and conduct, if found to be true, of said member of this Association, namely ———, who is herein charged with violations of ———, require disciplinary measures as provided in Chapter II, Section 2 (d), of the By-Laws of the California Medical Association and, therefore, prefers these charges.

Said Chapter II, Section 2 (d), reads as follows: "Acts and Conduct Subjecting Member to Censure, Suspension or Expulsion by Component County Society. Any active member of a component county society who has been adjudged guilty of a criminal offense involving moral turpitude, or who has been duly adjudged guilty by his society, in accordance with the procedural requirements of these by-laws, of gross misconduct as a physician or a surgeon or of a violation of any of the provisions of the professional conduct of his society or of the principles of medical

ethics promulgated from time to time by this Association or by the American Medical Association, shall be subject to censure, suspension or expulsion from his society by such component county society."

Respectfully submitted,

COMMITTEE ON PROFESSIONAL CONDUCT.

Date: ———

* * *

IV. *The details of service, certificate of service, notice of hearing,* and all of the other details set forth in Chapter II, Section 3, of the By-Laws of the California Medical Association should be meticulously followed.

* * *

V. *There should be no evasion* of the fact that the respondent who is being cited is to be tried; that the Council before which he is cited to appear is a trial body; or that he will be on trial when he appears.

* * *

VI. *The Chairman of the Committee on Professional Conduct should be assigned the definite duty of prosecutor,* the other members of the committee sitting as advisers.

* * *

VII. *The Council, which is in fact the jury,* should refrain from interrogation of the respondent or witnesses except in such instances as some question may be necessary to clarify some doubt existing in the questioner's mind. When there is such a question it should be addressed to the presiding officer.

* * *

VIII. *The Council should make a definite rule stating whether attorneys-at-law will be permitted to represent either side* in such a trial. The committee recommends that they be not permitted.

* * *

IX. *The respondent should be advised of his rights,* namely: that he may be represented by any member as counsel; (but if the foregoing recommendation (Item VIII) is adopted, it should be stipulated that he may not be represented by a member who is admitted to the Bar) that he, or his counsel, may cross-examine witnesses; that he may offer in evidence any records or documents that he deems fit; that he may enter objections as to testimony or to material in evidence; that he may address the Council in his own behalf; and that he has the right of appeal.

* * *

X. *A referee* should be requested in all cases.

* * *

XI. It shall be the *policy of the Council that the Chairman thereof shall remain as its presiding officer, but that all questions of procedure shall be answered by the referee, if any.*

* * *

XII. *On conclusion of the hearing,* the respondent, his counsel, if any, the Professional Conduct Committee, and the referee should be excluded and the verdict considered. The verdict should be ascertained by secret ballot in writing.

A time should be fixed in which briefs may be filed, and the Council should consider the evidence after such time has elapsed.

* * *

XIII. The Council shall establish as a policy, and shall recommend to the Board of Trustees that the Secretary shall be granted *authority to engage the services of a court reporter* for the purpose of securing a transcript of evidence at all trials.

* * *

XIV. *The Secretary of the Association shall advise the accused in writing of said accused's rights* under Chapter II, Section 3, Paragraph 5 of the By-Laws of the California Medical Association on a form on which shall be printed all of Chapter II, Section 3, Paragraph 5.

XV. *To avoid expressions of opinion, verdicts should be rendered as follows:*

"*Resolved,* That the charges against (name) be and hereby are dismissed" in case that the respondent is found not guilty;

or

"WHEREAS, (name), a member of this Association, has been charged with violation of certain sections or articles of the Code of Ethics; and

"WHEREAS, He has had a fair and impartial trial and has been found guilty;

"*Resolved,* That he be and hereby is (action taken)."

COUNTY MEDICAL SOCIETY HEADQUARTERS HOMES

The Official Journal's Plea for "Medical Buildings," as Made a Quarter of a Century Ago.—Twenty-five years ago, Editor Philip Mills Jones gave expression to a thought, neither then nor now new, but today even more worthy of serious reflection by all county medical associations of any considerable size. Editor Jones, in the following words (which appeared on page 152 in the "Twenty-five Years Ago" column of last month's issue), advocated homes for county medical societies:

> Have you thought anything about that suggestion in the last JOURNAL as to the county society owning its own building? It can be done by a good many—if not most—of the county societies in California. You all pay rent to somebody; why not pay it to the county society? It is merely a matter of finance, of getting together, and the getting together, in some places, seems to be the hardest part of the problem.

* * *

County Medical Societies Having More Than One Hundred Members Should Be Especially Interested.—A glance at the membership totals of the California Medical Association's component county societies (which, with five conjoint county units, each made up of more than one county, embrace fifty of California's fifty-eight counties; as listed on page 5 of the Membership Roster supplement of the February OFFICIAL JOURNAL) will promptly reveal the county societies credited with more than one hundred members each. Of organizations having such membership the California Medical Association possesses eleven: Alameda, Fresno, Los Angeles, Orange, Sacramento, San Bernardino, San Diego, San Francisco, San Joaquin, Santa Barbara, and Santa Clara. Why should not each of the societies mentioned (Los Angeles and San Francisco counties having already provided themselves with homes) consider financial ways and means, as well as location and plans, for the erection of headquarters homes? In Los Angeles County, several of the larger geographical branches (that of Long Beach, for instance, which boasts over 200 members) might well consider homes of their own. It is quite likely, if inquiry were made of the Federal Home Loan authorities, that plans could be devised whereby, with a showing of a basic investment or resources of 10 per cent (to be raised by initial voluntary contribution or assessment), it might be possible to secure a federal loan up to, perhaps, $6,000, with repayment on easy terms and low interest over a period of twenty years. If a lot were secured through donation or purchase, the initial hurdle would

have been cleared, and the remaining steps should bring no major hardships if ordinary budget caution were used.

* * *

Simple Headquarters Would Be in Order: Woman's Auxiliary Could Help.—An elaborate initial structure would not be necessary. A meeting hall, with shelvings for books, and a reading alcove, with anterooms, would answer all immediate needs. The woman's auxiliary in each county could lend a hand, both with furnishings and in the maintenance of such headquarters, and its library, clubhouse, and meeting-place accommodations. Why not, then, dignify your county medical society with a home of its own? The possession of headquarters property would not only add to the prestige of every association owning the same, but would have a stimulating influence upon the growth of the unit, and the development of finer fraternal and other affiliations. In our colleges and universities, the Greek-letter fraternities for many years have demonstrated the advantages of individual clubhouses. Surely, in the ancient guild of physicians, it should be attainable to duplicate what has been so often created and so successfully achieved by small groups of undergraduate students; and especially so today, when long-time, low-interest loans from federal sources may often be obtained on comparatively slender initial investment. We feel certain, also, that the established medical libraries of California will be happy to cooperate in starting local book collections, by donating duplicate volumes which otherwise must often be sold as waste paper.

* * *

A Special Committee on Headquarters Is in Order.—Why not, while the subject is ripe, have your own society appoint a special committee to look into this proposition? The officers of the California Medical Association will be glad to advise. For any members who may shy off at the thought of a local assessment needed to help purchase a lot, it will be in order to state that every applicant for membership in the Los Angeles County Medical Association today must pay, or sign a note to pay, the sum of one hundred dollars into the permanent quarters fund. That large county society, through fortunate investment some years ago, now has a headquarters and library building of unusual usefulness and attractiveness, and a home that is becoming an increasing benefit and joy to its members; and what has been done in Los Angeles and San Francisco can be repeated by other county units. San Francisco colleagues, in their annual dues, assess themselves even more heavily than do their fellows in Los Angeles. As already stated, the OFFICIAL JOURNAL of the California Medical Association became a propagandist for headquarters homes as long as twenty-five years ago. Why not, then, make an earnest attempt, in these years, 1938-1939, to prove whether such a desirable addition can be brought into being for your society? Surely, the proposal is worthy of earnest thought and discussion. "Where there is a will, there is a way."

SOME COUNTY HOSPITAL PROBLEMS: CONTINUED FROM FEBRUARY ISSUE*

County Hospital Articles in the February Issue.—In last month's issue, comment concerning certain conditions which had been brought to our attention was made under two captions: (1) "California County Hospital Bureaucracy! Which Way Leading?—State Medicine Through a Back-Door Entrance?" and, (2) "Los Angeles County Hospital Collections Bureau," this having as a subheading: "How Los Angeles County Charges the Indigent Sick for Hospitalization, While Accepting Gratuitous Medical Service to the Value of About Two Million Dollars Annually from Attending Physicians and Surgeons"; the latter article including some ten exhibits, and covering correspondence, the full Kern County Appellate Court decision, and other items.

To have printed the above in the OFFICIAL JOURNAL of the California Medical Association, and, after mailing, to have then sent copies to the Board of Supervisors or to the newspapers, would have resulted, probably, in little more than another experience with what so often takes place under such conditions, to wit, "move the report be received and filed." Therefore, and because the principles involved in the County Hospital conditions outlined were closely related to the State's welfare, the articles were released to the public press of Los Angeles two days in advance of the regular mailing date of CALIFORNIA AND WESTERN MEDICINE. It was heartening to note the prominence which the newspapers, of their own volition and without special request, gave to the discussion of these local county hospital problems. After publication of the charges in the press, several hearings were held, at which Los Angeles County officials and members of the executive board of the attending staff were present, the further study of the matter being then delegated to a joint group of the above parties. What the ultimate decision of the conferences will be is not possible, of course, to forecast; but that some of the conditions complained of will be remedied, is quite certain. For, not to modify certain of the present procedures must result ultimately in a popular outburst, with adoption of methods differing decidedly from those in vogue in the past. Elsewhere in this issue,† some additional, new evidence is submitted to substantiate statements made in the February issue.

* * *

The Essence of the Kern County Injunction. In this column, at this time, we would only emphasize the fact that, no matter how much legal and other language may be quoted or brought forward to the contrary, the really significant and far-reaching items of the Kern County Hospital Fourth District Appellate Court decision are the subdivisions (*a*) and (*b*) of Injunction Section 8

* See CALIFORNIA AND WESTERN MEDICINE, February, 1938, on pages 73 and 97.

† See report in Special Articles department, on page 216.

(see February issue, page 109, first column), which read:

. . . The following should be admitted:

(*a*) An indigent sick or dependent poor person.

(*b*) A needy sick and dependent, or partially dependent citizen in case of emergency. . . .

The other items which follow (*c*) to (*e*) relate only to exceptional cases involving, at any one time, but a very small number of citizens.

The crux of the Kern County Hospital decision, therefore, reaffirms what has been the contention of the medical profession, whose members in the Los Angeles County Hospital yearly donate professional services with money value in excess of two million dollars! Physicians of California hold that the Constitution and the Welfare and Institutions Code of California make it possible for the constituted authorities (the boards of supervisors) of the constituent counties to create and maintain institutions known as county hospitals, designed primarily for indigent citizens who are sick or injured. In such institutions, the citizens who belong to the indigent class shall be entitled to receive treatment; provided that, in case of emergencies, partially dependent citizens (meaning medically indigent persons, *i. e.,* citizens who, after providing themselves and their families with housing, clothing and food, do not possess means for adequate hospitalization or medical care) may also be admitted; these latter being expected to repay the county later, in proportion to their means. Nonindigent citizens have no legal right to hospitalization in county hospitals except in case of emergency, and are then legally obligated to pay the full costs of their hospitalization.

* * *

The Staggering Hospitalization Charges to Indigent Patients in Los Angeles County Hospital.—As stated in our previous articles, the County of Los Angeles, through its Department of Charities, has deemed it proper to practically demand repayment of hospitalization charges from all patients, both indigent and near-indigent, the statements so rendered for the period July 1, 1937, to December 31, 1937, inclusive, aggregating $2,366,779.30, with an estimated staggering total of $4,733,588.60 for merely the county's current fiscal year!

With only the sum of about $300,000 of this $4,733,588.60 possible of collection, and probably 90 per cent of the amount so collected coming from "partially dependent citizens," whose financial status, by any business-like method in the great majority of cases, should have been decided through social service investigation *prior to admission,* it seems almost self-evident that it is debatable whether it is good business policy to use a procedure that annually costs $109,383.09 to maintain, in order to make possible collections of only $300,000; the Collection Bureau, using methods, at the same time, so seemingly harsh that the indigent poor and their friends, to a probable number of, say, 500,000 persons out of a county population of 2,500,000, are driven to become, in many instances, more or less antigovernmental or bolshevistic! Surely something is wrong in a set-up capable of leading to such deplorable results. Letters received during the last several weeks from both physicians and patients attest to the above, and some examples are printed in this issue, on pages 216 and 219.

* * *

County Hospital Problems Are Being Studied by the California Medical Association Council. Los Angeles County, with its 3,000 patients in the County Hospital, its 4,000 tuberculosis sick in Olive View Sanatorium and adnexa, and 1,000 patients in the Infirmary of its County Farm (these latter housed there because of chronic diseases), presents, of course, a major problem all its own, the cost figures, naturally, assuming tremendous sums. However, what has been commented upon in the articles referred to has not been so much the quantitative phases, but, rather, the qualitative nature of the principles involved. And these principles come into play, more or less, in all the county hospitals of California, and are receiving serious consideration by the Council of the California Medical Association.

* * *

Each County Society Should Investigate Its Own County Hospital and Make Prompt Report.—As previously stated, each component county medical society, through its officers and proper committee, should make an early study of the admission and other requirements and procedures of its respective county hospital, sending a copy of the report thereon to the central office of the Association for the consideration of the Council. With full knowledge of factual information in these matters, gathered from all counties in the State, it would then be possible for the members of the constituted authority of the Association—the Council—to formulate plans and make report to the House of Delegates at the 1938 annual session, to be held in Pasadena. Let us repeat, the county hospital subject is important and vital to the interests both of the citizenry and the medical profession of the State, and is worthy of the earnest attention of every county medical society in California!

THE CRIMINAL INSANE

A Recent Case.—The article by Dr. Ruggles A. Cushman, Superintendent of the Mendocino State Hospital at Talmage, California, on the subject, "The Criminal Insane," printed on page 83 of the February issue of CALIFORNIA AND WESTERN MEDICINE, has attracted considerable attention in medico-legal circles, and deservedly so. Its appearance, at a time when, in Los Angeles, a jury brought in a verdict of manslaughter against a man who had killed his wife and his friend, and then, when the same jury, a few days later, on a separate plea of "not guilty by reason of insanity," affirmed that the perpetrator of the deed had been "insane" when the deed was perpetrated, made the presentation by Doctor Cushman's views and the discussion thereon most pertinent. In the case above referred to, the prisoner, subsequent to the

"insane" verdict, was sent to the psychopathic ward of the County Hospital, where alienists, appointed by the Court, were called upon to examine him and give their opinions as to his sanity. At the time of this writing, the Court in charge has not brought in its decision; but the opinion of men on the street is that the prisoner will be given his liberty as a "sane" person.

In this particular case, which, owing to its unusual nature, was given much space and exploitation in the public press, both locally and elsewhere, there was the usual spectacle in the trial, of medical witnesses being pitted one against the other, giving their expressions of opinion on hypothetical questions. What took place was, as Doctor Cushman so aptly stated when he wrote:

> Another court proceeding which brings the psychiatrist into popular disrepute is the manner in which he must testify as an expert.

In the case here under discussion, the prisoner is now to be examined by a new group of psychiatrists, and, quoting Doctor Cushman again, there comes into play the next step, namely, that on the

> successful plea of insanity, [concerning] these individuals . . . , unless [they be] suffering from a definite psychosis, the *hospital staff can only testify that they are sane, and the judge is bound to release them.**

* * *

California's Laws on the "Criminal Insane" Need Amendment.—Doctor Cushman's proposed amendments to the Penal Code's "1026 law," along lines such as are in operation in Colorado, Ohio, Maine, Vermont, and New Hampshire, are worthy of careful consideration; he stating the proposition thus:

> . . . The law should be amended and supplemented by provision that, before a prisoner is tried upon his insanity plea, he shall be sent to a state hospital for one month or longer, if possible, for continued observation. If found actually suffering from a mental disease, he could be detained until recovery without the expense and ordeal of a trial, and then be tried on a fair basis. If found sane by the hospital staff, his opportunity for escaping by means of an insanity plea would not be so favorable. Also, justice would be done to that type of offender who is actually suffering from a psychosis, but who, due to popular feeling against his antisocial act, is often dealt with most unjustly.

A proposed act submitted to the 1937 California Legislature, which would have accomplished the above, failed of enactment, but effort to secure its passage will be made again when the Legislature convenes in 1939.

Doctor Cushman's paper, with its discussion, has distinct educational value, and it is to be hoped that reprints may be made and distributed during the next few months, not only to legislators, but to medical and bar associations, service and other clubs. This is to be wished for, in order that presentation of facts and the remedial measures advocated may elicit support from the citizenry of the State, thus making much-needed legislation in these matters more possible of enactment next year. Certainly, there is need of improvement in the present laws.

* A few days later the decision of "sanity" was handed down, and for those who are interested, a press item is reprinted in this issue, on page 212.

A "HUMANE POUND LAW" INITIATIVE TO BE ON THE STATE ELECTION BALLOT IN NOVEMBER, 1938

A Proposed Antivivisection Measure: But Under a New Name.—Most members of the California Medical Association are aware that California "antivivisectionists" have secured, under the euphonious title, "Humane Pound Law," the necessary 186,380 signatures of voters for submission of a new proposed initiative law—in this instance, one dubbed the "Humane Pound Act," and that it will be given a place on the November, 1938, State election ballot for decision by the State's electorate as to its adoption.

Editorial criticism concerning this measure, which its proponents hope to give a place on the statute folios of California, was made in the *Journal of the American Medical Association* in the number for February 19, 1938. The importance of the issues involved, therefore, warrant reprinting of these *J. A. M. A.* comments:

California's "Humane Pound Law" and Medical Research

Unscientific movements are constantly promoted, based on misinformation, prejudice, emotionalism and cynical racketeering. Chiropractors, naturopaths, naprapaths, herbologists and all sorts of -paths, -ologies and -isms ally themselves with other quacks and sentimentalists to oppose medical research, which exposes the hollowness of their pretensions. The antivivisectionists have made hay in the California sunshine. Fortified with some prominent theatrical names and disregarding the absence of scientific qualifications in such sponsorship, the antivivisectionists have frequently attempted to throttle research in California and in other states.

In 1932 and subsequently, a determined attempt was made to interfere with the use of dogs from the San Francisco pound, by the medical schools in the San Francisco Bay area.[1] This attempt was frustrated by the combined vigilance of the medical profession and public health authorities. Undeterred by this failure, the "antis" in 1937 turned to the initiative provided under California law and circulated a petition for a so-called Humane Pound Law. The crucial provision in this law is that dogs and cats shall not be delivered to medical schools from public pounds. This means that research involving dogs would be prohibitive in price, since the breeding of dogs for research purposes is not practical. The petition received the requisite number of signatures and will appear on the ballot at the election of November 8, 1938. Many of the signers of the petition obviously did not understand what they asked for with their signatures. As was pointed out in our discussion of the Colorado proposal last week, many signers fail to understand the ultimate effects of the petitions to which they affix their signatures. Many estimable persons, imbued with the spirit of kindness to animals, may feel inclined to vote for this pernicious legislation unless they are fully informed in time as to what it would mean in the harassment of medical education, the hampering of medical research, and interference with the manufacturing and testing of drugs and biologic products.

A California Society for the Promotion of Medical Research is the answer of the enlightened people of California to the challenge of the antivivisectionists and their cultist, faker, faddist and fraud-monger allies. Among California's leading citizens who will be active in the society, or will lend it their moral support and influence, are Ray Lyman Wilbur, president of Stanford University; Robert Gordon Sproul, president of the University of California; the Rt. Reverend Charles A. Ramm, Monsignor St. Mary's Cathedral, San Francisco; Rabbi Irving F. Reichert,

1 Question Is of Facts, San Francisco *Chronicle*, July 11, 1932.

Temple Emanu-El, San Francisco, and Rev. William Kirk Guthrie, D. D., San Francisco. Organization and membership work is proceeding actively.

The forces seeking the adoption of the so-called Humane Pound Law appear to be well financed and give every evidence of determination to achieve their purpose. They have heretofore demonstrated their total immunity to any appeals to reason. Dominated as they are by their mistaken ideas of humanitarianism, by which, if successful, they would precipitate on the people of California a deluge of disease, pain and death, they cannot be persuaded. They must be defeated. This issue is not confined to California. Just as this law is not primarily a humane pound law, but an entering wedge for intolerable restrictions on the freedom of scientific research, so its adoption in California will be the signal for renewed campaigns in other states. If anyone doubts this, the following quotation from an antivivisectionist publication should be convincing: "... there is but one honorable stand to take, and that is to talk, write and work for the *complete abolition of vivisection*"[2] (capitals in original). The medical profession of California and its enlightened allies, the dental and veterinary professions and many of California's leading citizens, have the welfare of their state and its people as much at heart as any crackbrained coterie of false humanitarians can claim to have. They are backed by considered opinions based on scientifically demonstrated facts which underlie the modern record of health improvement through the application of the fruits of research.

The medical profession has always stood for the public health against those fanatical groups who, offering nothing constructive, would tear down the whole structure of scientific research. It is time the public helped in its own defense. The California Society for the Promotion of Medical Research is a step in the right direction. It should become a permanent organization, national in scope, adequately supported with money, similar to the British Research Defense Council. The American Medical Association has long had a Committee for Protection of Medical Research. With the coöperation of the Bureau of Health and Public Instruction, this committee has helped to keep the antivivisectionists partially in check by cooperating locally with medical schools and medical societies. Numerous efforts directed at crippling research have been defeated. All this is not enough. Promotion is needed as well as defense. A national society of enlightened persons in all professions, in business, in industry and in public life, is needed to preserve the country from the evil influence of this distorted antivivisectionist propaganda.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 197.

[2] The Animal Helper, Vol. 7, January, 1938, published by N. F. Whitaker, Dayton, Ohio.

Hepatic Involvement in Exophthalmic Goiter.—Retzlaff reviews the literature and describes five cases that were observed at the university clinic in Königsberg. Although the literature indicates that a knowledge of a toxic impairment of the liver is based chiefly on pathologic anatomic studies, the cases reported here indicate that in all of them the signs of hepatic impairment were already demonstrable during life. Icterus, the most typical symptom, and an increase in the bilirubin content of the blood were present in three cases. The fact that in two of these three cases the condition improved again indicates that the icterus which develops during exophthalmic goiter does not have the unfavorable prognosis (fatal outcome) that has generally been ascribed to it. On the basis of clinical studies and necropsies the conclusion is reached that parenchymal and functional disturbances of the liver are not a rarity in patients with exophthalmic goiter but that they can be observed occasionally, especially in the severe forms of exophthalmic goiter.—*Zeitschrift für Klinische Medizin.*

EDITORIAL COMMENT†

CONTROL OF CERTAIN BLINDNESS HAZARDS AMONG MYOPIC CHILDREN AND ADULTS

Near-sighted or myopic children, as well as adults, may have a separation of the retina from minor injuries, often so trivial as hardly to impress the memory as especially important among the ordinary bumps and bangs of daily play or routine. From among these myopic individuals, during a period of time, will originate two-thirds or three-fourths of all the separated retinas which probably will have to be operated upon to prevent blindness—perhaps of their only useful eye—because, when it occurs in the first eye, our early records indicate that, without special care, it occurs finally in the last eye with disturbing frequency (more than one in four).

Fortunately, this threat to the second eye has been enormously reduced by hazard-avoiding habits learned by the patient and guardians during the operation and protracted postoperative period of intensive training. Thus, today records are clearly showing that often a "stitch in time saves nine," because the last eye is easily eight times as valuable as the first eye, and we can often do the operation now, leaving just one knotless running stitch, removable without lid opening, on the fifth day.

This experience leads us to suggest that some of our rules be used preventively, beginning in school days:

1. Insist on an eye examination report, showing definitely the amount of myopia when present. (Fifteen cases of low myopia should be found per hundred individuals examined, on an average.)

2. At least do not encourage myopic children to engage in rough sports, and gymnasium or other strenuous exercises. To avoid hazard they should not be permitted to engage in or loiter near games involving flying objects such as stones, balls, sticks, hands, or fists.

(*a*) Advise against racing, physical competition and combat.

(*b*) Discourage the use of the various modifications of the old doorknob method of pulling teeth. Pulling hair is just as bad.

(*c*) Advise against sit-down strikes; they often lead to brawls, and if tear gas, or even dust particles get into the eye, the consequent rubbing is a vicious producer and subsequent augmentor of the separated retina.

(*d*) Warn against the evils of rubbing the eyeballs strongly when washing the face or at any other time. When rubbing is irresistible, teach them to rub the lid margins against the lower bony rim of the orbit—not against the eyeball.

(*e*) Teach them never to think of all activities in terms of the hazards thereof, since the above

† This department of CALIFORNIA AND WESTERN MEDICINE presents editorial comments by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California Medical Association to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

examples are only a few of the commonest. Eyesight is worth every precaution.

Without doubt, to whatever extent these or equivalent rules are followed, a corresponding reduction in the occurrence of blindness from separated retina will result.

"NATURAL IMMUNITY" VERSUS DRUG TOXICITY IN MALARIA

There is no drug, nor combination of drugs, at our disposal today which will completely rid an individual of malarial parasites. It is unwise, therefore, to attempt sterilization of all parasites during a primary attack of malaria. Relapses cease to occur naturally, in untreated humans, when the defensive mechanism of the host has managed to overcome the fever and attendant symptoms which the protozoa cause in nonimmune patients. No attempt should be made during the primary attack, in the opinion of the Malaria Commission of the League of Nations,[1] to continue treatment with the hope of preventing relapses. If treatment during the first recrudescence is not successful in preventing relapses, drug therapy of later recrudescences should be delayed as long as possible in order to permit the patient to acquire some defensive power.

Taliaferro and Cannon[2] have recently studied the cellular reactions during primary and repeated infections of monkey malaria in Panaman monkeys. This extensive study has been most carefully planned and carried out, and confirms the conclusions reached from previous studies on immunity in bird malaria. These authors have demonstrated that when the crisis occurs in monkey infections the phagocytosis of infected cells is suddenly increased. This, they say, is to be looked upon as an acquired immunity response in contrast to the phagocytosis which has gone on before the crisis and which is believed to be due to a natural immunity. It is the intensive phagocytosis at the crisis which reduces the infection to a low level, in spite of the fact that the parasites may continue to reproduce at their original rate.

In order to prevent relapse in malarial-infected humans, it would seem wise to wait until the first recrudescence has occurred and then to use specific drug therapy in such a way as to assist "rather than hinder the development of the patient's natural defensive forces." By repeating this plan with the same watchfulness during later recrudescences, *i. e.,* by using the specific drug at a later period and more sparingly than at first, "in most cases the patient becomes fortified or preimmunized against the disease to the extent that he not only ceases to suffer from relapses, but fails to have an attack when he is reinfected."[1]

For the treatment of an acute attack of any form of malaria the Commission recommends that either quinin or atebrin be used. For routine use either drug may be tried. Each has some disadvantages, but they are trivial in comparison with their merits as antimalarial agents. Usually one gram of quinin bihydrochlorid daily, for from five to seven days, is sufficient for the primary malarial attack. If atebrin is chosen, then 0.3 gram daily may be given for the same period. The Malaria Commission contends that "curative doses of quinin or atebrin for treatment of an attack should not be continued longer than seven days, and that treatment for five days will often suffice." Plasmochin is not recommended by the Malaria Commission for routine use.

When these principles are violated, serious consequences may result. The following patient is cited as an example of atebrin poisoning, which followed the injudicious use of antimalarial drugs.

Report of Case.—M. D., an American housewife, twenty-eight years old, acquired her first attack of malaria while visiting one of the atols near Tahiti. She had her first chill four days after she left the island en route to Panama. The parasites of benign tertian malaria were demonstrated in her blood. She was given quinin 0.66 gram daily for four days, and for the next three days daily intramuscular injections of quinin and urea hydrochlorid, the amount being unknown. She was then symptom-free for one month, but suffered her first relapse and again had parasites in her blood. Atebrin was administered in 0.1 gram amounts three times daily for eight days. Since the patient weighed 48 kilos at that time, the total dose given must be considered as approximately 50 per cent above the amount usually recommended. Within twenty-four hours after finishing the course of treatment, the patient's skin became deep yellow, she complained of persistent headache, and was nauseated and vomited. Her temperature became abnormally high, and she was conscious of an increased heart rate and was very weak. When first seen by us, fourteen days after she had started atebrin therapy, her skin was bronze color, but her sclerae were not discolored. The liver was enlarged and tender to deep pressure, but the examination was negative otherwise, except for the blood pressure of 100 millimeters of mercury systolic over 60 millimeters diastolic. Laboratory examinations of blood, including complement-fixation for syphilis, agglutinations against eleven antigens, icterus index and nonprotein nitrogen were negative or within the limits of normal. Feces, blood, and urine were negative for parasites. An electrocardiographic tracing was normal. The rose bengal hepatic function test showed a 42 per cent depressed function.

Comment.—It is our opinion that this patient has suffered from improper treatment, since the excessive amount of atebrin administered has presumably damaged her liver. There has been no attempt in this case to permit the natural defensive forces to overcome the infection. Not only should the dose of such a potentially dangerous drug as atebrin be based on body weight, but its use should be limited to the minimal amount which will abort a malarial attack or control symptoms. This changed attitude in antimalarial therapy should result in developing an increased host immunity in patients treated for this disease.

THE PRACTICAL USE OF THE "ELIMINATION DIETS"

Trial diet may be used as a diagnostic measure whenever food allergy is suspected. It will be used with negative results in many instances, but much less often than is the Wassermann reaction or blood count. A test negative diet, eliminating the skin-reacting foods, may be tried first, but my continued experience confirms the general opinion that allergenic foods frequently fail to be indicated by positive scratch reactions, and when the intradermal test is used many reactions arise which are due to nonspecific irritants or to allergens which produce no clinical symptoms. Moreover, the intradermal test with foods often fails in the presence of active food allergy. Thus it is usually better to use trial diets, such as the elimination diets which exclude those foods which most frequently produce allergy, modified by definite scratch reactions or by the history of idiosyncrasies to specific foods.

For over twelve years I have been using the elimination diets in this manner for diet trial, and think that some comments on their manipulation and preparation can bear repetition.

Allergenic foods often must be eliminated for several days, and at times for one to three weeks, before definite evidence of improvement arises. In fact, the tissue changes resulting from long-continued allergy may be so marked, bordering on the irreversible type, and associated possibly with impaired vascular supply, or superimposed infection, that the maximum effect of the proper diet may not arise for several months. Therefore, too rapid decisions about the benefit to be derived from an elimination diet is unwise, and may, unfortunately, deny the patient relief from his chronic allergy. When elimination diets are to be used for more than a few days, the patient must be provided with sample menus which will assure a proper intake of calories, protein, vitamins, and minerals to maintain nutritional balance. Especially important is the weighing of the patient every few days, and regular interviews with the physician so that undesirable weight loss will not occur. The addition of calcium and vitamin D to the diet is usually desirable.

During such visits the physician must be certain that the patient is adhering to his diet. Possible mistakes in the kitchen, such as the stirring of the patient's food with a spoon that has touched milk soup or egg if they are excluded from the diet, should be prevented. Canned soups often contain unrecognized foods not included in the patient's diet. The possibility that so-called pure flours may be mixed with wheat or other ingredients must be appreciated. It is especially hazardous to entrust the making of bakery products to an ordinary baker in an unsupervised shop, since the temptation to include wheat or other forbidden food against orders is often too much to resist. Above all else, the patient himself is apt to taste a little food off the diet, or to take an interdicted food, thinking "a little will do no harm." Careful inquiry of the various foods eaten in friends' homes, restaurants, or hotels, will often reveal slight or definite mistakes. With such careful supervision of the diet, the patient will gradually develop the necessary scrutiny and care without which success with diet trial is impossible.

In every large city it will be necessary to have dependable bakers who will make bread, muffins, cookies, cakes, and other bakery products which contain specified flours and are devoid of various cereals, milk, eggs, and other ingredients, according to the physician's prescription. Such bakers, however, will need constant supervision, as shown recently by one who against orders included gluten flour in so-called wheat-free products. The patient, moreover, must be provided with recipes for bakery products, various desserts and candies if desired, which can be made at home, and their accurate use must be definitely assured by the physician.

If the physician uses the elimination diets routinely, the dietitians in the hospital or the nurse or assistant in the office can be trained to give instructions about the diet to the patient, but the determination of the accuracy with which the diet is being followed, and the determination of its effect, must be made by the physician himself.

The elimination diets can be prescribed very simply by ordering Diets 1 and 2 minus certain foods and plus others, or by ordering Diet 3 or Diet 2, alone or plus and minus specific foods. When routine diets 1, 2, or 3 do not give evidence of benefit, it may become desirable to use supplemental diets which have been previously described which contain one starch, one protein, a few vegetables or fruits, sugar, a specified oil, and salt, such foods being determined by the history, the results of previous dietary trial, and by positive skin reactions. The fact that patients may be sensitive to practically all fruits, all cereals, even to all meats, and at times to all vegetables in varying degrees, must be remembered.

In the use of elimination diets,[1] it must be emphatically stated that nutritional damage must never occur, and that undesirable weight loss must not be allowed. If the physician cannot arrange menus which prevent these undesirable results, diet trial should be promptly discontinued.

REVERSIBLE GERMICIDES

It has long been recognized by professional bacteriologists [2] that the phenol coefficient, as determined by recommended standard techniques, is not a reliable index to the therapeutic usefulness of surgical antiseptics. While pneumococci and streptococci, for example, are readily killed in the test tube by dilute solutions of mercurial salts, the treatment of pneumococcus or streptococcus peritonitis with the same or even more concentrated mercurial solutions rarely gives curative results. Such antiseptics usually cause an earlier death of

1 Rowe, Albert H., M.D.: Clinical Allergy. Lea & Febiger, 1937.

2 Leonard, G. F.: J. Infect. Dis., 48:358, 1931. Birkhaug, K. E.: J. Infect. Dis., 53:250, 1933.

the inoculated animal than the untreated control. Methods for the therapeutic (or *in vivo*) titration of surgical antiseptics, therefore, have been sought by numerous investigators. One of the most promising of these is currently proposed by Dr. George A. Hunt[2] of the Department of Bacteriology, Washington University School of Medicine.

In the Hunt therapeutic titration, 0.1 cubic centimeters of a 50 per cent dilution of a twenty-four-hour broth culture of an "invasive strain" of Staphylococcus aureus is injected intracutaneously into a shaved area on the abdomen of mice. The hypodermic needle is dipped in India ink before making the inoculation, so as to leave a permanent tatoo mark at the site of injection. This injection causes a local inflammatory reaction from 3 to 10 millimeters in diameter, with subsequent suppuration, necrosis and scab formation. Desquamation and spontaneous healing is the usual end-result; in only two of the several hundred control mice thus far injected by Doctor Hunt, was there perforation of the abdominal wall with the development of fatal peritonitis.

The antiseptics thus far tested by the St. Louis bacteriologist include "disinfectant I" (chlor-iso-octyl-resorcinol), merthiolate, metaphen, mercurochrome, oxyquinolin, chlorazene, and hexylresorcinal. These antiseptics were tested as aqueous solutions twenty times the minimum concentration necessary to kill Staphylococcus aureus within ten minutes in the test tube. The test dose was usually 0.1 cubic centimeter of this multilethal concentration injected through the tatoo mark on the skin.

"Disinfectant I" was studied in greatest detail. This resorcinol product has a phenol coefficient of 1800 when dissolved in distilled water, reduced to a coefficient of 500 in the presence of one per cent serum. "Disinfectant I" was able to prevent the formation of the skin lesion in mice if administered at the same time the area was infected. Given one hour after infection, it prevented the formation of the lesion in only one mouse out of four. Administered three hours after infection, it had no demonstrable prophylactic or curative effects.

Even more discouraging results were obtained with merthiolate and metaphen which were without therapeutic effects even when the multilethal antiseptic and the staphylococcus culture were mixed prior to intracutaneous injection. Merthiolate and metaphen, therefore, are presumably "reversible germicides," rapidly dissociating from the staphylococci in the presence of mouse tissues.

"Reversible germicidal action" was first suggested as a biologic possibility by Mueller and Gegenbauer[3] about sixteen years ago. Doctor Hunt confirmed this reversibility by repeatedly washing merthiolated and apparently dead staphylococci with salt solution. Fully 90 per cent of the presumably nonviable staphylococci were restored to full viability by such washings, even after two to seven hours' contact with the multilethal antiseptic. By treating the same apparently nonviable merthiolated staphylococci with H_2S, practically 100 per cent of them were fully resuscitated. The standard phenol coefficient technique suggests that staphylococci are killed within five minutes by exposure to this concentration of merthiolate. "Revitalizations" of apparently dead bacteria, even after 100 days' exposure to mercury salts, have been reported by certain European investigators.[3]

In contrast with this resuscitation, Doctor Hunt found that the germicidal actions of "disinfectant I," oxyquinolin, chlorazene or hexylresorcinal are not "reversible," "revitalization" being impossible after only thirty minutes' exposure to these antiseptics. Doctor Hunt found that even these "non-reversible" disinfectants would not prevent the formation of the experimental skin lesion in mice if administered later than two hours after inoculation. None of them was capable of shortening the time of healing, once the staphylococcus infection was established in cutaneous tissues.

Whether or not more encouraging therapeutic results could be obtained with intracutaneous injections of specific antiserums, enzymes, endocrine products or other physiologic stimulants, has not yet been studied by this technique. It has been shown by Bronfenhrenner and Sulkin,[4] however, that local applications of bacteriophage usually do more harm than good in experimental staphylococcus skin infections in rabbits.

It is of interest in this connection that priority for the discovery of "reversible germicides" should conceivably be given to Doctor Mudge of the University of California (Davis), who has hesitated to report many of his results for fear of unfavorable publicity. "Bacterial death" as a "reversible phenomenon" or "death as a reversible chemical reaction" might readily have been misunderstood by nontechnical readers.

Just as there has been evolution in the content of public health knowledge, there has been also evolution in its administrative procedure. The primitive conception of applied public health was a service to be brought into action to control the spread of epidemic diseases, purely as an emergency measure. The accumulation of scientific knowledge relative to the nature and causes of preventable diseases, however, has made it more and more certain than by conscious planning and alert vigilance by organized health forces on continuous duty, epidemics might in large measure be forestalled and many of the most serious endemic health problems which would otherwise go unchallenged might be successfully overcome. Unfortunately, the great majority of our rural communities in this country have as yet made no preparation for any kind of health service beyond the emergency phase, and precious little of that. As evidence of the fact that concerted effort and conscious planning have only very recently been introduced into our governmental machinery, it should be noted that the first state board of health was organized in Massachusetts in 1869, and was followed two years later by the organization of the State Board of Health of California.—The Health Officer.

DURAL DEFECTS: HOW IMPORTANT IS THEIR SURGICAL REPAIR*†

AN EXPERIMENTAL AND CLINICAL STUDY UPON HETEROPLASTIC AND AUTOPLASTIC DURAL GRAFTS

By Mark Albert Glaser, M.D.
and
Clinton H. Thienes, M.D.
Los Angeles

Discussion *by Edmund J. Morrissey, M. D., San Francisco; Frederick Leet Reichert, M. D., San Francisco; Howard W. Fleming, M. D., San Francisco.*

DURAL defects caused by trauma, or produced by the removal of tumors of the brain, or the excision of cerebral scars, may or may not be repaired. If these defects are to be repaired, direct closure of the dura by suture, or the use of heteroplastic or autoplastic grafts may be utilized.

Various reasons have been advanced for the use of dural grafts. The earlier investigators were firm believers that the insertion of a graft prevented the formation of adhesions, and thus were a large factor in the prevention of posttraumatic epilepsy.

At the present time, the closure of dural defects by the use of grafts is a question for surgical debate. It is believed by some that a dural graft is entirely unnecessary, and at times may even be harmful because of its foreign body reaction, and its aid in the formation of excessive adhesions.

POINTS IN FAVOR OF DURAL GRAFTS

Those who favor the use of dural grafts quote the following reasons for their usefulness: (1) the prevention of rough edges of bone irritating the brain; (2) to close a dural defect after the removal of a large meningioma, or a cerebral scar and thus prevent surface adhesions; (3) to form a watertight closure after the removal of tumors or scar, provided the ventricle has been opened; (4) to prevent the formation of a brain fungus following depressed fractures or tumors, provided the intracranial pressure is high; (5) to prevent the development of meningitis following depressed fractures, which could arise secondarily from an infected scalp; (6) to form a definite layer over the surface of the brain so that, in cases of depressed fracture, fragments of the bone removed may be inserted in place to form a bony union.

AUTHORS' STUDIES

For the purpose of determining whether a dural graft is necessary, and to further determine if a dural graft is to be utilized, whether a heteroplastic or an autoplastic graft is more suitable, a series of twenty-four operations were carried out upon dogs, and a small series of clinical cases were studied. In this group of experiments the relative merit of dural repair was studied by the use of fascia lata, animal membrane, and a blank dural opening. These animals were operated upon under aseptic technique. The temporal muscle was stripped away from the calvarium under anesthesia, and a half-inch by one-inch opening was made in the skull. The dura was not injured. An area of dura of approximately the same size was then resected, without injury to the underlying arachnoid. This dural opening was left intact in a certain proportion of these animals, and in others a piece of fascia lata or animal membrane was sutured in place. The animal membrane utilized was sheep intestine which had been sterilized and tubed. These animals were observed for a period of twenty-four hours to one year.

EMBRYONIC BACKGROUND

The dura mater develops from the embryonic mesenchyme which early grows out as a covering to the neural tube. The mesenchyme condenses and splits and differentiates into scalp, bone, dura, arachnoid, and pia mater. Over the brain the dura mater is a single dense fibrous membrane, which may be subdivided into a denser outer layer of collagenous fibers, loosely adherent to the skull and serving as periosteum, and an inner looser layer of collagenous and yellow elastic fibers. The venous sinuses of the skull lie between these two layers. At the foramen magnum the outer layer separates from the inner, to become the periosteum of the vertebrae, the inner layer remaining as the dural covering of the spinal cord. The dura mater is loosely held to the inner surface of the skull by prolongations of its fibrous meshwork, and to the arachnoid membrane by delicate tissue bridges. Jordan makes the statement that the dura is rich in lymphatics, but Weed contends that these spaces are not true lymphatics lined with endothelium, but are merely areolae in the dense membrane. The vascularity of the dura mater is attested to by all writers. The large vessels are confined largely to the outer layer, while the vessels of the inner layer are fine and numerous. Hassin describes the dura mater as characterized by lacunae and numerous interstitial spaces containing nests of arachnoid or mesothelial cells. The characteristic cell is the fibroblast, but there may be found also histocytes and plasma cells. The outer layer is said to contain more nuclei than the inner. Where not attached to the bone, the outer layer is covered by a thin endothelioid coat. The inner surface more nearly resembles a true serous surface, being lined by a thicker type of endothelioid cell.

SURGICAL REPAIR OF DURAL DEFECTS

The repair of the dural defects by surgical means was first carried out by Sacchi in 1893. He recommended that the osseous disk of a trephination be turned around so that the periosteum approximated the dural defect. Abbe, in 1895, referred to a patient of Beeches', wherein gold foil had been employed to cover the raw area left after the separation of subdural adhesions. He, however, preferred rubber tissue. Since this pioneer

† List of references will appear in the reprints.

Fig. 1.—A section of the skull has been removed. The dura is seen on its inner aspect. The two cranial defects are visible on both sides. On the right side, animal membrane has been sutured in place. On the left side the dural defect has been left open. Note how the space has been covered by the new growth of dura. It is from these sections that material has been taken for microscopic studies. Time after operation, five weeks.

Fig. 2.—Section taken three days after surgery. Note the thick clot which has formed over the brain and the fascia lata graft at the base of this clot. Microscopic sections were taken directly through this area.

work, many different tissues have been suggested for plastic operations upon the dura. Among those advocated were heteroplastic and autoplastic fascial transplants used alone, or in combination with muscle and fat, skin muscle, splitting of the intact dura, peritoneum, periosteum, amniotic membrane, veins, arteries, hernial sacs, egg membrane, tunica vaginalis, celluloid plates, laminated catgut, dog peritoneum, blood vessels of the calf, and finely scraped intestine of the sheep.

Autoplastic fascial transplant was first introduced by Kirschner, and was also advocated by von Saar, Kleinschmidt, Smirnoff, Denk, von Ebert, Hill, Barany, Gille, Neuhoff, Jeger, Alissandri, Halstead, and Caylor. Peritoneum was first utilized as a dural graft by Kocher and Beresowsky. It was further investigated by von Saar, Kolaczek, Smirnoff, Finsterer, etc. Peritoneal transplants were considered unsatisfactory because of the difficulty in obtaining them and, further, the fact that they adhered quickly to the underlying brain. The use of adipose tissue alone, or in combination with fascia, was utilized by Smirnoff, Rehn, Körte, Marchand, Bode, Koennecke, Drevermann, Byford. The use of periosteal grafts for the filling of cranial and dural defects was first suggested by Sacchi in 1893. This idea was confirmed by researches of Wolf, Koenig, Durante, Rhigetti, von Hacker, Delangenière, and Kerr. Though the primary purpose of the periosteal graft was to cover cranial defect, some attention was paid to regeneration of the underlying dura. Splitting the dura in half was first suggested by Bruning, and was independently described by Elsberg, and also utilized by von Eiselberg and Dobrotvorski. The technical difficulty in dividing the dura prevented its widespread use. The use of celluloid was advocated by Finsterer and von Eiselberg. Penfield and Peet believed the use of celluloid is quite valuable in preventing adhesions of the dura to the overlying scalp, and recommend its use in traumatic cases. Finely scraped intestine of the sheep was advocated by Hanel, and methods for disinfection of this membrane was suggested by Hofmeister and Taddei. Catgut applied in strands and laced into a network has been considered superior to all substance previously utilized, and absolutely prevented adhesions to the underlying brain (Righetti, Dainelli, Caporale, Caporale e Bertini, De Bernardis, Caporale and De Bernardis). Less common substances advocated, and more experimental in nature than practical, were the blood vessels, especially the vena cava, Unger and Bettman; hernial sacs and dog peritoneum, Finsterer; egg membrane, von Saar; tunica vaginalis, Kocher; omentum, Kozireff; viable muscle, Dixon; epithelium, Roux-Berger and Ballance; and umbilical cord by Perimoff. Experimental studies carried out by Trotter, Sayard and Harvey, and Penfield, supplied definite proof that the dura regenerated itself spontaneously, sufficient to cover any traumatic or operative defect.

In spite of the numerous substances suggested to close dural defects, the present consensus of opinion is that the most suitable is autoplastic fascia. If the defect is small, temporal muscle fascia is utilized. If it is large, fascia lata is recommended.

EXPERIMENT PROCEDURES

The experiments were performed upon a series of dogs; the first group, studied from twenty-four hours to one year, consisted of fascial transplants; the second group consisted of animal membrane

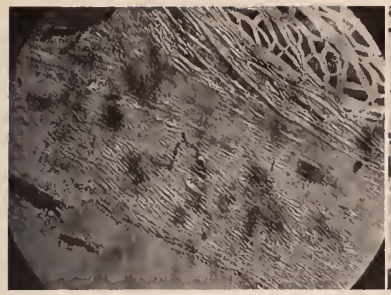

Fig. 3

Fig. 4

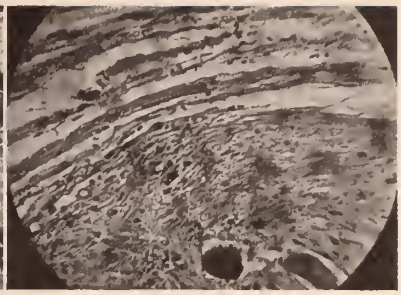

Fig. 5

Fig. 3.—Dura removed. Three months after operation. Thick layer of dura formed; few cells; bone formation at edge.

Fig. 4.—H. G., age thirty-nine, dural defect with the insertion of a graft, six weeks after surgery.

Fig. 5.—High power. Fascia inserted. Five weeks after operation. Note young fibroblasts, foreign body giant cells, plasma cells, and clasmatocytes.

grafts; and in the third group the dural opening was not covered in any way. These animals were sacrificed by intra-arterial formalin injection. The stains utilized in this study consisted of hemotoxylin and eosin; Mallory's phosphotungstic hemotoxylin stain for fibrils; Mallory's aniline blue-orange G stain for the presence of collagen; and Laidlaw's silver stain for reticulin.

Upon gross examination, the muscle was adherent to the newly formed dura. The defect was entirely closed and smoothly healed on the undersurface. In all three sets of experiments, the gross appearance of the newly formed dura was the same. The dura was adherent to the overlying bone, and when the skull was resected came away with the bone, leaving a free, non-adherent brain beneath. There were no adhesions whatsoever to the underlying arachnoid. This, of course, had not been injured. In one case where a small cortical blood vessel had been injured, and in another where an excessive amount of bleeding had occurred over the surface of the brain, small fibrous strands of adhesions were attached to the brain (Fig. 1). Sections taken through the surface of the brain were entirely normal. In those experiments wherein the dural defect was left open, a thin clot was present in the first twenty-four hours, but within a three-day period a thick clot had formed (Fig. 2). In order to study these sections, a wedge of brain and clot were excised through the bony defect, thus preserving the surface of the brain and the clot in one adherent piece.

In the group wherein the dural defect was not replaced, a definite membrane was visible within seven days, which became quite apparent on the tenth day. On microscopic examination, the process of repair consisted of formation of granulation tissue with a definite outgrowth of fibroblast from the muscle and the dural edge. There was no clear indication that there was a transition of the mononuclear cells of the blood. The clasmatocytes, or wandering tissue cells, as well as occasional polyblast, were present (Fig. 3). In a clinical case, the newly formed dura was evident six weeks following surgery, and here again new cell formation seemed to arise from the fibroblasts of the muscle and dura, and not from the blood-clot (Fig. 4).

The second series of animals was followed over a similar period of time. Fascia lata and temporal muscle, however, were utilized to cover the defects. The process again was one of repair with a definite invasion of a similar cell structure, except that foreign body giant cells were in evidence. Within a five months' period, phagocytosis of the fascia had taken place, as well as the laying down of calcium. Within nine months there still was evidence of the fascial membrane, while within a period of a year the presence of calcium was the only indication that foreign body had previously existed (Fig. 5). In a clinical case a similar histological picture was present, and coincided in every detail with the animal experiments (Fig. 6).

In the third series, animal membrane was utilized, which proved to be as satisfactory as the

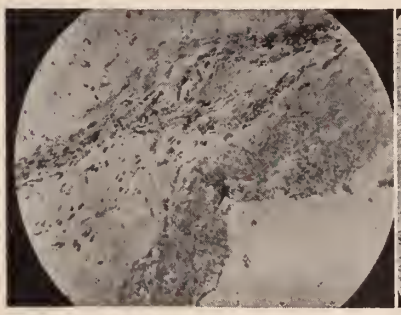

Fig. 6

Fig. 7

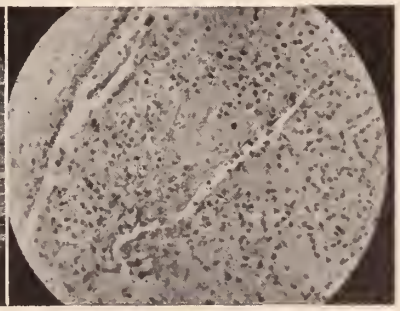

Fig. 8

Fig. 6.—M. L., age ten. Fascial graft five months after insertions.

Fig. 7.—Membrane inserted. One year after operaton. Membrane apparently completely absorbed. Dense layer or dura formed; slight infiltration of small round and plasma cells near pia.

Fig. 8.—R. B., age thirty-six. Animal membrane graft, eight months after surgery.

fascia, both as to its ease in application and the resultant histological picture. The same type of cell took part in the reaction, and at the end of a year complete absorption had occurred (Fig. 7). In a clinical case, studied eight months after the introduction of the graft, the membrane was quite apparent. It was entirely surrounded by fibrous tissue. The dura about the membrane was thicker than the surrounding area, and there were no adhesions (Fig. 8).

CONCLUSIONS

1. Experimental and clinical studies indicate that the use of either a heteroplastic or autoplastic graft for the repair of dural defects is entirely unnecessary.

2. Should one feel inclined to use a dural graft, heteroplastic animal membrane is equally as efficient as autoplastic fascia.

3. Dural defects caused by surgical procedures or depressed skull fractures without injury to the underlying arachnoid spontaneously repair themselves.

4. If the arachnoid is not injured, adhesions will not form between the dura, arachnoid and brain, but will form between the overlying skull and periosteum, as well as fascia and muscle.

5. Both types of grafts are entirely absorbed within twelve months.

6. The cells that form the new dura are apparently derived from the overlying fascia and muscle and from a peripheral outgrowth of dural cells, which arise from the cut margin of the dura.*

727 West Seventh Street.

DISCUSSION

Edmund J. Morrissey, M.D. (330 Medical Building, San Francisco).—The work of Doctors Glaser and Thienes is an excellent and timely piece of experimental research. Their findings agree in all important details with similar studies reported by Sayard and Harvey, and Lear and Harvey.

In my opinion, the work shows conclusively that defects in the dura will heal without the formation of adhesions in a very short period of time, provided the underlying arachnoid has not been injured. On the other hand, if the arachnoid has been injured, adhesions will form, regardless.

Too often, however, we see the mistake being made of covering these dural defects with facial transplants, or some other foreign material, which certainly is unnecessary and which, in my opinion, will do nothing more than increase the adhesions.

Frederick Leet Reichert, M.D. (Stanford University Hospital, San Francisco).—This experimental study of Doctors Glaser and Thienes confirms the clinical observations of neurosurgeons that, whether a portion of dura is excised or replaced without suture, the resultant gap is readily and completely closed by tissue which resembles dura and officiates as dura. This applies only where the pia arachnoid is intact.

In the clinical application of this experimental study, one need not be apprehensive about replacing a dural defect if overlying muscle is available; but if muscle cannot be used, a fascial graft or the prepared membrane will form a new dura. Again, this applies in cases in which the pia arachnoid is intact. Where the pia arachnoid is absent from any cause, one prefers to cover this pial defect by a plastic procedure with the patient's dura, leaving a dural defect over the intact pia arachnoid.

Howard W. Fleming, M.D. (384 Post Street, San Francisco).—Doctors Glaser and Thienes's clinical and experimental studies give further substantiation to the popularly accepted theories regarding the healing processes of brain and dural tissues. The facts that dural defects repair themselves spontaneously, and that adhesions do not form if the arachnoid is uninjured, are reassuring.

In the past, surgeons often went to great extremes to effect a complete closure of the dura following operation. This, in most cases, is no longer considered necessary. There are circumstances where the use of a dural graft may be advantageous.

It is advisable to debride and repair penetrating wounds of the brain. If the patient is cared for soon after injury, a careful debridement will lessen the possibility of infection and possibly reduce the morbidity. A snug graft in the dura will minimize the contusion to the brain and prevent a fungus should a marked increase of intracranial pressure develop as a late complication. A careful repair of the dura will also allow the replacement of small fragments of bone to fill the skull defect that could not otherwise be utilized.

In the treatment of post-traumatic epilepsy, excision of a cortical scar and the overlying dura is often necessary. Repair of the dural defect is not essential, but probably advisable. Occasionally, false meningoceles develop in cases where there is a loss of bone over the dural defect.

The kind of material to be used in dural grafts depends largely upon the past experiences and the preferences of the individual surgeon. Many prefer autoplastic substances, such as temporal fascia or fascia lata, on the theory that there is less foreign-body reaction than when heteroplastic substances are used. The author's conclusion in this paper would seem to negate this idea.

Probably careful handling of tissues and hemostasis are more important than the type of material used to fill a dural defect.

* We wish to extend our sincere thanks to Dr. H. M. Beerman for his aid in the experimental surgery, and to Dr. M. Bettin and Dr. E. M. Butt for their advice in the preparation of the pathological material.

TRICHINOSIS*

By James B. McNaught, M.D.
San Francisco

Discussion *by John J. Miller, M.D., San Francisco; R. D. Friedlander, M.D., San Francisco; E. M. Butt, M.D., Los Angeles.*

THE Mosaic code, of some three thousand years ago, forbade the use of pork: "And the swine is unclean to you. Of their flesh shall ye not eat, and their carcass shall ye not touch."[1] Some believe that it was forbidden because the hog had been worshiped by certain heathen tribes; but modern interpreters[2] of this code maintain that Moses had noticed a peculiar train of symptoms in people who had partaken of pork, and thus condemned its use as food. For thirty centuries the Jews were ridiculed for abstaining from pork. During this time no one heard of trichinosis and, as far as is known, no one, until 1835, saw trichinella. In February of that year James Paget, then a medical student at St. Bartholomew's Hospital, London, "was dissecting the muscles of a subject, when his scalpel became quickly and repeatedly blunt."[3] He saw numerous small calcareous specks in the muscles. There was no microscope available at the hospital, but Robert Brown, the botanist, had a simple one at the British Museum through which Paget saw a worm within a capsule. He made careful sketches of the parasite, and prepared a report of his discovery for the *London Medical Gazette*;

* From the Department of Pathology, Stanford University School of Medicine.

Read before the Pathology and Bacteriology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

but it was never printed, although the manuscript may still be seen at the College of Surgeons. A specimen from Paget's subject was submitted to Richard Owen of the College of Surgeons, who named the parasite Trichina spiralis, and published his findings. The name was later changed to Trichinella spiralis.

Dr. Henry Bowditch [4] of Boston, in 1842, reported the first case of trichinosis in America in a young man who died from a malignant growth. Joseph Leidy [5] of Philadelphia, in 1847, demonstrated the parasite in pork. It was Zenker [6] of Dresden, who, in 1860, described clinical trichinosis. He established the connection of the parasite, which he saw in the muscles of a patient, with an illness clinically regarded as typhoid fever. He ascertained that the patient had eaten of flesh from a certain pig that had caused serious illness in everyone who had eaten it, and finally pointed out the parasites in ham and sausage from the pig in question. Within five years the people of Prussia and Saxony were in a state of panic because of fear of the disease during terrible epidemics. The German Government then instituted a method of examining pork microscopically, which is still in use. It consisted in pressing bits of muscle between glass plates and examining it, under the microscope, for the parasites. The infected animals were condemned for human consumption. Stiles [7] stated that the trichina inspection force in Prussia in 1895 was almost as large as the entire regular army of the United States of that year (27,089). Such a system gave a false sense of security, and pork was still consumed raw with dire results.

There is no doubt that rats harbor the trichinella. They have long been incriminated as the chief source of hog infection; but Spink and Augustine [8] are of the opinion that trichinosis in hogs is usually the result of their ingesting trichinous pork either in garbage or in the offal at times of slaughter. They believe that the infection in rats has its origin in trichinous pork scraps, and that it may be transmitted from rat to rat through cannibalistic habits, but that its return to swine through rats seldom occurs.

INCIDENCE: REPORTS IN THE LITERATURE

Hundreds of cases of trichinosis [9,10] have been recorded in American literature since Bowditch described his findings in 1842. While it is not considered to be so common as many infectious diseases, it does occur far more frequently than the published case reports and vital statistics indicate. Recent statistical studies, based on actually finding the parasites, show that trichinosis is a common disease in this country, and that the majority of cases are of such a mild form that they often pass unrecognized. In 1931 Queen,[11] by artificial digestion of fifty grams of diaphragm from 344 consecutive autopsies in Rochester, New York, found 17.5 per cent contained Trichinella spiralis. None of these cases gave a history of trichinosis, although some gave a vague "rheumatic" history. In a second series of fifty-eight cases in Boston, Queen found 27.6 per cent positive. Riley and Scheifley,[12] in a study of the diaphragms of 117 cadavers in Minneapolis in 1934, found 17.1 per cent positive for trichinella by pressing the muscle between glass slides. Hinman,[13] in 1936, examined ten grams of diaphragm, by the digestion method, from two hundred autopsies in New Orleans, and found only 3.5 per cent positive. Undoubtedly, he would have found a higher percentage had he used the fifty-gram quantities digested by Queen. Hall and Collins [14] reported 13.67 per cent of three hundred human diaphragms in Washington, D. C., positive for trichinella, using combined digestion and microscopic methods.

INCIDENCE IN SAN FRANCISCO

Recently we [15] reported that 24 per cent of the diaphragms from two hundred autopsies in San Francisco were positive for trichinella, using fifty-gram quantities by the digestion method. The diaphragms from an additional twenty-five new-born infants gave negative results. Living larvae were found in all the positive cases in San Francisco, but the number was usually small, being less than twenty to each fifty grams of muscle in 79 per cent of the cases. None of the clinical records of the positive cases revealed a definite history of trichinosis. Many of the case histories recorded "rheumatic" or "muscular" or joint "pains," "gastro-intestinal upsets" and the like, but these were as plentiful in the negative as in the positive cases. The results of these studies in six large, widely separated cities indicate that the actual incidence of trichinosis in the United States is rather high—averaging 15.6 per cent, or one in every six individuals.

Vital statistics of the Department of Health of San Francisco for the years 1931 to 1935 show a reported incidence of trichinosis, ranging from 0.0016 to 0.0044 per cent of the total population for each year. Those for the State of California, for the years 1932 to 1936, range from 0.0014 to 0.0006 per cent. A study of the sources of infection in 311 cases of trichinosis in California shows that 50 per cent were caused by the eating of salami or mettwurst sausages. The striking discrepancy between the number of cases of trichinosis reported, and the number of positive cases found at autopsy, demonstrates that the milder forms and sporadic cases of the disease usually pass unrecognized.

LIFE CYCLE OF TRICHINELLA SPIRALIS

Knowledge of the life history of the trichinella and the pathology of the disease is essential to an understanding of the symptomatology of trichinosis. Man is an accidental host to the parasite when he ingests infected meat. Pork is the usual offender; but a small epidemic due to bear meat [16] has been reported in this State.

Digestive juices liberate the encysted larvae, which pass into the upper intestine. In the course of two or three days they mature, copulate and, as early as the fourth day, the females, having burrowed into the mucosa, start bearing their young into the lymph spaces. During several weeks the

Fig. 1.—Photomicrograph of cardiac muscle, showing necrotic muscle-fibers infiltrated by leucocytes, but no trichinella larvae. (X450).

Fig. 2.—Photomicrograph of sausage pressed then between glass slides, showing many encysted trichinella. (X40).

Fig. 3.—Photomicrograph of living trichinella larvae in the sediment of a digested human diaphragm. (X25).

female ejects a total of 1,000 to 1,500 actively motile young, which migrate and are carried by the lymphatics into the general circulation. The entire body is flooded with enormous numbers of embryos, which increase rapidly in size to almost ten times their original length. Many penetrate the skeletal muscles, become surrounded by a capsule of connective tissue and, in the course of time, often calcify, but may remain alive for many years. Larvae have been found in almost every tissue, fluid, and excretion of the body, but those which do not enter voluntary muscles usually die rapidly.

FACTORS CONCERNED IN THE LOCALIZATION OF TRICHINELLA LARVAE

It has long been known that the circulating trichinella invade such muscles as those of the diaphragm, tongue, larynx, and eye, the masseter and intercostal muscles, more than others. This has been explained by the fact that these are more active than other muscles. However, Berger and Stähelin [17] could demonstrate no quantitative relationship between the activity of a muscle and the number of trichinella it contained, using one paralyzed and one normal leg of animals infected experimentally.

Scheifley [18] investigated the rôle of increased blood flow in localization of the larvae by the removal of the lumbar sympathetic chain and ganglions from one side of dogs. Subsequent infection with trichinella revealed no significant change in localization of the larvae between the normal limbs and those with increased blood flow.

Lewis [19] found that the muscles favored by trichinella contained far less glycogen than those which are relatively spared. The diaphragm of normal guinea pigs contains only 7.2 milligrams per cent of glycogen, the masseter muscles 16.1, while those of the forelegs contain 488.1. He depleted the glycogen content of some of the animals by insulin, and administered large quantities of dextrose to others and infected all with trichinella. Dextrose lessened the migration of the parasites into the muscle, while insulin favored it. This is an encouraging step toward clarifying the question of specificity of localization of trichinella.

PATHOLOGIC CHANGES

The changes in the muscle during trichinous invasion are summarized from Sobel.[20] About the eighth to tenth day of the infection, embryos are found in the skeletal muscles, their long axis parallel to that of the muscle fiber. The fibers lose their striations and assume a finely granular appearance. With eosin-hematoxylin stain, the granules are a blue-violet color instead of the pink of normal muscle. This basophilic degeneration starts near the parasite and extends along most of the length of the muscle fiber. The trichinella curls up within the fiber, and the latter swells to two or three times its normal thickness. The muscle nuclei, normally close to the sarcolemma, increase in number and size, and move centrally about the parasite, become pale-staining and eventually degenerate. The granular degenerated muscle fiber assumes a more homogeneous compact appearance, forming a well-circumscribed elliptical mantle about the coiled worm. An interstitial myositis accompanies these changes from the beginning with infiltration of polymorphonuclears, eosinophils, and lymphocytes. The mesenchymal granulation tissue encircles the parasite with connective tissue, which later becomes hyalinized collagen of considerable thickness. Calcification may begin as early as the fifth month.

Trichinous myocarditis is not a specific picture. There is an active focal cellular infiltration of the myocardium, with lymphocytes, eosinophils, and polymorphonuclears, with necrosis and fragmentation of the muscle fibers apparently caused by the migrating larvae. Figure 1 is a photomicrograph of the cardiac muscle of a woman of sixty-four, who succumbed to trichinosis during the third week of her illness. The eosinophil count reached 39.5 per cent during the second week. Encysted larvae are rarely, if ever, found in the heart muscle. We have examined microscopically the hearts of two patients dead of trichinosis, and hearts of many rats with skeletal muscles peppered with encysted larvae, but have never encountered one encysted in the heart. The hearts of fifteen humans with encysted trichinella in their diaphragms at autopsy

failed to yield a single larvae by the digestion-concentration method.[15]

The meninges of patients exhibiting neurological manifestations may show marked infiltration with lymphocytes, plasma cells, fibroblasts, macrophages, and masses of eosinophils surrounding embryonic trichinella.[21] The brain itself may show granulomatous nodules, with or without parasites, and perivascular infiltrations of polymorphonuclears, lymphocytes, plasma cells, gitter cells, and fibroblasts.[22]

SYMPTOMATOLOGY

The symptomatology of the usual form of trichinosis may be closely correlated with the life history of the parasite. The maturation of the worms in the intestines corresponds to the gastro-intestinal upsets, nausea, vomiting, diarrhea, colic, and fever in the early stage of trichinosis. The period of dissemination of the embryos is marked by muscle aches, difficult and painful mastication, speech and respiration, petechial hemorrhages, edema, and eosinophilia. Spink and Augustine,[9] in an analysis of thirty-five cases of trichinosis, call attention to the fact that many do not exhibit a sufficient number of these symptoms to be readily diagnosed.

Trichinosis is comparable with any generalized bacterial infection. The chief difference is that the embryos of the trichinella are much larger than bacteria. The lesions produced are essentially a combination of toxic manifestations and embolic phenomena.

Myocarditis is one of the most serious, and not so uncommon complications of trichinosis.[23] It is frequent in severe infections, and is seen usually in patients dying in the fourth to eighth week of the disease. Cheney [24] has called attention to the occurrence of extreme hypotension in trichinosis.

It is not unusual to observe neurological manifestations in trichinosis, since the embryos invade the spinal fluid and brain. Most and Abeles [22] recently reviewed this subject, listing cases simulating meningitis, acute and chronic encephalitis, ocular disturbances, diplegia, deafness, and the syndrome of amyotrophic lateral sclerosis.

DIAGNOSIS

The diagnosis of a case of trichinosis should not be difficult, if it follows the common clinical course. A febrile disease with gastro-intestinal symptoms, muscle aches, and edema of the eyelids, calls for a blood count. Most cases of trichinosis will show a moderate leukocytosis, with an eosinophilia. The eosinophils usually increase rapidly, reaching a peak in the third or fourth week. We have also observed this repeatedly in experimental trichinosis in animals. The eosinophils in human trichinosis may mount to 75 to 90 per cent, although counts of 30 to 40 per cent are more frequently encountered.

The finding of the larvae in the body or body fluids of the patient makes the diagnosis certain. Examination of the stool for the parasites is often advised, but this procedure is rarely rewarded with success. Eosinophils have been found in the stools of trichinosis patients.[25] The laking of large quantities of blood or searching the sediment of spinal fluid is rarely satisfactory. Muscle biopsies, when obtainable, may prove satisfactory if the infestation is heavy, but there may be no parasites found in the excised tissue. Biopsy material or suspected meat is usually examined by one of three methods: (1) Portions of the material are pressed thin between glass slides and examined microscopically for encysted parasites. This is simple and rapid, and yields highly satisfactory results when the muscle is heavily infected. Figure 2 is a photomicrograph of a bit of sausage handled in this manner. This meat was responsible for an outbreak of trichinosis in Lower Lake, California. (2) Stained sections are essential for observing histologic changes in trichinous tissue; but unless the parasites are present in large numbers they may be missed if only a few slides are prepared. (3) The most satisfactory method in our hands for studying suspected material is by digesting the muscle with liberation and concentration of the larvae.[15] Figure 3 is a photomicrograph of the concentrated sediment from a human diaphragm.

SKIN AND SEROLOGIC TESTS

Within the last decade skin and serologic tests have been found of value in doubtful cases of trichinosis. Bachman [26] was the first to use trichinella antigen for diagnostic purposes. Augustine and Theiler [27] applied the test to human beings, and concluded that the skin test and precipitin reaction are of specific value in the diagnosis of trichinosis. Many other investigators have confirmed their findings. Recently, Spink [28] reported fifty-nine positive skin tests in sixty patients with trichinosis. The single negative reaction was elicited in a moribund patient, whose muscles at autopsy were shown to be heavily infiltrated with trichinella.

McCoy, Miller, and Friedlander [29] found that 92 per cent of thirty-six persons ill with trichinosis gave positive skin reactions, and Kaljus [30] reports 74 per cent of sixty-six cases were positive.

Skin Reactions.—Spink [28] describes two types of skin reactions to the antigen, an immediate and a delayed. The immediate type usually is not obtained until the second week of the infection. Within five to ten minutes after intradermal injection of the antigen a blanched wheal appears, sometimes with pseudopodia, but always with a surrounding zone of erythema. The reaction usually reaches its maximum within an hour, when it gradually subsides. The delayed type of skin reaction consists of an erythematous flare, following injection, which quickly subsides. Then, in twelve to twenty-four hours there is a red, slightly edematous, tender area from 1 to 3 centimeters in diameter, at the site of injection. This type, he believes, occurs early in the course of the disease, and later changes to the immediate type.

The precipitin test is performed by carefully layering 0.3 or 0.5 milliliter of a 1-100 dilution of trichinella antigen over a similar amount of serum in a small serological tube. The control consists of layering saline diluting fluid over the serum. Both tubes are incubated for an hour in a 37.5 degrees centigrade water bath. An opaque whitish ring at the junction of the antigen and serum indicates a positive test. Spink states that the precipitin test

usually becomes positive by the end of the fourth week.

We have recently investigated the skin reactions to trichinella antigen. The antigen is prepared in general according to the methods of Bachman, and others.[28,29] Adult white rats of the Wistar strain are fed about twenty free trichinella larvae per gram, by means of a stomach tube. Our strain of Trichinella spiralis was isolated from a human diaphragm, and is kept alive in the rat colony. After about five weeks the infected animals are sacrificed, skinned, eviscerated, and ground in a meat chopper. The meat is thoroughly digested in six to twelve hours by agitation in an aqueous solution of one per cent granular pepsin and 0.7 per cent hydrochloric acid in a 37.5 degree centigrade incubator. The lying larvae are thus freed from the meat and their capsules. The digest is passed through a twenty-mesh, then a sixty-mesh sieve, to remove undigested particles and bone, and placed in a large glass separatory funnel. The larvae settle to the bottom, are drawn off into a beaker and washed with tap water until the washings are clear and no débris is seen microscopically. The concentrate of larvae is dried rapidly in open Petri dishes within a vacuum desiccator in the incubator. It is important that this process be rapid to prevent bacterial growth, which would complicate the antigenic specificity. The larvae are then extracted with ether for twenty-four hours and again dried. This powder is the antigen. A 1-100 dilution of the powder is prepared in a small flask, using a buffered saline solution (0.5 per cent NaCl, 0.143 per cent Na_2HPO_4, 0.036 per cent KH_2PO_4 and 0.4 per cent phenol for preservative) with a pH of 7.1 This is permitted to extract for twenty-four hours at room temperature, then ground in a ball mill for another twenty-four hours. The resultant mixture is passed through a Seitz filter. The clear fluid, considered to be a 1-100 dilution of the antigen, is further diluted with the saline solution to make 1-500 and 1-10,000 dilutions of the original antigen, and placed in sterile vials with rubber stoppers of the type readily punctured by an hypodermic needle. Vials of the saline diluting fluid are prepared as controls.

The tests are made by the intradermal injection of 0.1 cubic centimeter of diluted antigen into the skin of one forearm with a similar injection of control solution into the other arm. The tuberculin type of syringes with short bevel, 26-gauge, hypodermic needles are best suited to these procedures. We have followed the methods of McCoy, Miller, and Friedlander, of routinely using the 1:10,000 dilution of the antigen for the first injection. If this is negative, a second test is made in about twenty-five minutes, using the 1:500 dilution. The immediate type of reaction is not considered positive unless the wheal is at least 7 millimeters in diameter and the zone of erythema 20 millimeters.

To date we have tested only five cases of clinically active trichinosis, ranging from the third to the sixth week of illness. These have all shown positive skin tests of the immediate type. One case of illness with a history, signs and symptoms of trichinosis and 16 per cent eosinophilia, on the tenth day gave a delayed type of reaction with a 25 millimeter tender area of erythema and edema. When tested on the thirtieth day, at which time the eosinophils had mounted to 54 per cent, the reaction was of the immediate type with a 10-millimeter wheal and 30-millimeter zone of erythema. A precipitin test on the serum from this patient on the thirtieth day of illness, using a 1-100 dilution of trichinella antigen, was also positive.

COMMENT

In view of our finding at autopsy that 24 per cent of the diaphragms in San Francisco contained trichinella with no history of trichinosis,[15] we are curious as to the number of persons living in this area with no history or symptoms of infection who show a sensitivity to the trichinella antigen. We have tested only sixty-three such individuals thus far, but have found 12.7 per cent of them give the immediate type of reaction and 11.9 per cent the delayed type. If all of the delayed types are specific reactions—and we are not convinced that they are —the total per cent of positive skin tests in this series is 24.6. This is unbelievably similar to the 24 per cent found at autopsy.

McCoy, Miller, and Friedlander found 18 per cent of 104 control individuals in Rochester, New York, and 6.5 per cent of forty-seven controls in San Francisco gave positive immediate reactions to the trichinella antigen. They state that delayed reactions were sometimes noted after twenty-four hours, "but their presence could not be correlated with the immediate reaction, and they have been disregarded."

Theiler, Augustine, and Spink[31] note that patients may show a positive skin reaction as long as seven years after infection with Trichinella spiralis. Thus, it is not possible by means of the skin test alone to distinguish between acute trichinous infections and those which occurred some years previously. We conclude from our few data that even the subclinical cases of trichinosis, which must greatly exceed the clinical ones, show sensitivity to the antigen.

TREATMENT

Patients with trichinosis should be treated as those with any other general febrile disease, by bed rest, adequate fluids, nourishment, and relief of pain. A preliminary purge has been recommended to remove such parasites as may still be free in the intestines. This may be of questionable value, since the females are usually buried in the mucosa.

A variety of agents have been employed in attempts to destroy the parasites in the body. Neoarsphenamin, antimony and potassium tartrate, acriflavin, rivanol, gentian violet, metaphen, Lugol's solution and sodium iodid were all found ineffective in experimental trichinosis by Miller, McCoy, and Bradford.[32] Miller, in a personal communication, states that further work indicates that there may be some value to the use of thymol, but that toluol and xylol are ineffective.

Since there are reports that the liberal use of alcoholic beverages, while ingesting trichinous-

meat, offers protection, we are now investigating this subject. Our results thus far indicate that such is really the case, but that the mechanism is one of interference with digestion and failure to liberate the larvae rather than a toxic action on the worm.

Blumer [33] questions the desirability of destroying, at one time, the enormous numbers of trichinella which are present in the body. It is possible, if an effective parasiticide were discovered, that the destruction en masse might result in a sudden flooding of the system with large quantities of toxic substances. Obviously, the larvae cannot be removed from the patient after they have left the intestinal tract and become encysted in the muscles. The administration of vitamin D [34] and calcium [35] has been advised to accelerate calcification of the capsule.

McCoy [36] has shown that immunity can be developed in rats, and others [37,38] report that while immune serum does not damage the parasites, it apparently neutralizes the toxemia. Salzer [39] was encouraged by his use of serum from recovered patients in treating clinical trichinosis.

COMMENT

It is readily seen that trichinosis is quite a common disease, but that the majority of cases are probably subclinical in type and are not diagnosed. The quantity of parasites ingested by the individual is probably the greatest factor in determining the clinical course. Its recognition depends on a critical history of the patient's illness as to possible sources of infection, examination of suspected meats, and a study of others partaking of the same foods. Patients with gastro-intestinal complaints, fever, vague muscle aches which persist, and an eosinophilia, should have a skin and precipitin test for trichinosis. Biopsy is of value if the parasites are present in sufficient numbers in the excised muscle, but it is an inconvenience to the patient, and frequently cannot be obtained. Skin and precipitin tests have been shown to be of high diagnostic value and may be performed at practically no inconvenience to the patient.

Since a certain number of individuals with no history of infestation show a positive skin test, it must be borne in mind that all evidence must be considered before making a diagnosis of trichinosis, especially in the sporadic cases, and that too much weight must not be attached to any one feature. The history, symptoms, signs, eosinophilia, skin and precipitin tests, must all be properly evaluated.

It is impossible to detect infected pork by practical methods of meat inspection. Therefore, it is necessary for the consumer to assume the responsibility of preventing trichinosis by either avoiding or thoroughly cooking all fresh pork.

SUMMARY

1. Trichinosis is a common disease, but the majority of cases are subclinical in type and are not diagnosed.

2. The incidence of trichinosis, as revealed by actually finding the parasites in autopsy material in six widely separated cities in the United States, averages 15.6 per cent.

3. Pathologic changes in skeletal muscle, heart muscle, meninges, and brain are briefly described.

4. Methods of diagnosis are reviewed. Eosinophilia is the simplest and one of the most reliable diagnostic clinical aids.

5. The technique for skin and precipitin tests, method of preparing trichinella antigen, and results of the tests are outlined.

6. The consumer must assume the responsibility of preventing trichinosis by thoroughly cooking all fresh pork.

DISCUSSION

John J. Miller, M.D. (Stanford University Hospital, San Francisco).—Splinter hemorrhages under the nails, chemosis of the conjunctiva, and double vision are occasionally observed.

I cannot quite agree with Doctor McNaught's statement that direct examination of the blood and spinal fluid for parasites is rarely satisfactory. On two occasions I have found larvae in the blood. About 40 cubic centimeters of blood are taken, laked with two volumes of distilled water, and then centrifuged down. If any larvae are present, they are readily apparent in the sediment. This method is the quickest and simplest one for confirming the diagnosis. To my mind the procedure next in order is a lumbar puncture. I have seen larvae in the spinal fluid of five patients. Three or four minutes of centrifugation are sufficient. Obviously, the more spinal fluid obtained, the better the chance of finding larvae.

The skin test seems to be of definite value and should be used if antigen is available. While, as Doctor McNaught said, it is not possible by means of the skin test alone to distinguish between active and healed trichinosis, the skin hypersensitivity has a very definite tendency to decrease with time. Therefore, a positive reaction to a high dilution of antigen, 1:10,000 or higher, suggests active infection. We have seen skin reactions in acute trichinosis to a 1:1,000,000 dilution. The use of these dilutions is also important, when it is recalled that the skin test is not strictly specific. When McCoy tested ninety-two persons in southern Louisiana infected with Trichuris trichiura, he found 18 per cent positive to a 1:10,000 dilution, and 62 per cent positive to a 1:500 dilution. This group reaction is, of course, due to the close biological relationship between Trichinella spiralis and Trichuris trichiura.

Eosinophilia is also of the greatest aid in diagnosis. It should be remembered, however, that an absence of eosinophilia in a very sick patient does not rule out trichinosis. In two instances we have noted a drop in eosinophilia to less than 4 per cent within three days of death. Coincidentally, the skin reaction, which had been positive to a high dilution, became very weak shortly before exitus.

With the use of the above procedures a diagnosis can almost always be confirmed. I do not believe that a biopsy is often warranted. If a biopsy is finally done, however, the material should be digested as Doctor McNaught describes, rather than sectioned.

R. D. Friedlander, M.D. (384 Post Street, San Francisco).—I am glad, for two reasons, to be allowed the privilege of discussing Doctor McNaught's paper: First, because of my interest in trichiniasis, which has led me to follow carefully the literature on the subject for the past five years, so that I feel competent to state that Doctor McNaught's paper is not only the most comprehensive review of the subject to date, but it adds original findings that enhance to a considerable degree our present knowledge of trichiniasis. The second reason is that I should like to amplify several points that have been touched upon by Doctor McNaught.

Those acquainted with this problem know that my interest has been centered mainly in the intradermal test as a specific diagnostic measure. It was the original hope that the test, if positive, would give unequivocal evidence of an acute infestation by the larvae of Trichinella spiralis. We know now that, while there is no doubt about the specificity of the test, there may be some doubt about the acuteness of the infection when the test is positive, because it has been shown that individuals may exhibit a positive intradermal reaction as long as seven years after the first infection. Recent work by Spink, however, may help somewhat to clear up this problem. Spink has reported two types of intradermal reactions to trichinella antigen: an immediate, and a delayed. The immediate reaction usually does not occur until some time around the second week of illness, whereas the delayed reaction is said to occur earlier in the course of the disease. There has always been some doubt about the specificity of the delayed reaction; but if Spink's findings are corroborated by further work the intradermal test might serve not only as a diagnostic aid, but also as an indication of the stage of infection in new cases. What one might expect of the intradermal test, applied to an individual suffering from trichiniasis a second time, has not yet been determined. It is apparent that the allergic aspect of this problem must be of considerable importance. For the present, however, we must still rely upon a proper evaluation of "the history, symptoms, signs, eosinophilia, intradermal and precipitin tests" for the diagnosis of trichiniasis.

The diagnosis having been made, one is next interested in therapy. There is no specific remedy for trichiniasis as yet, so that prevention would seem to be of major importance, if members of the medical profession feel that this disease is on the increase. Doctor McNaught and, among others, Doctor Blumer of Yale Medical School, feel that the consumer must assume the responsibility of preventing trichiniasis by either avoiding or thoroughly cooking all pork. Doctor Blumer felt that the individuals responsible for the occurrence of the disease were not the meat dealers, but the consumers.

I cannot help but feel that this is a highly disputable opinion, particularly on the part of the profession. It seems all the more inconsistent, if one considers the fact that prevention of such diseases, which may be transmitted to the consumer in food products or by food handlers, has never been accomplished satisfactorily by the assumption of responsibility by the consumer. It is comparable to the statement that if the public consumes milk from tuberculous cows, it deserves to contract tuberculosis; or if the public consumes milk or water from typhoid-contaminated sources, it is responsible for the occurrence of typhoid fever. While these statements may be literally true, such has not been the stand of local or state health departments. The only justification for such a stand regarding trichiniasis is that, because it is not contagious, it could never assume large epidemic proportions; hence the attitude of *caveat emptor*.

This brings up the point that an important piece of work of considerable bearing on the epidemiologic aspect of this disease has been either overlooked or ignored. In 1932, Augustine and Theiler reported the results of precipitin and intradermal tests on a small number of swine infested with Trichinella spiralis. These tests were found to be positive in pigs, which, after slaughter, showed no larvae on extensive microscopic examination of muscle slips from the tongue, diaphragm, intercostal and masseter muscles. Yet after artificial digestion of the same muscular tissue, in the same manner as described by Doctor McNaught, large numbers of living trichinella larvae were obtained. The conclusion was that the precipitin and intradermal tests were more accurate than muscle examination. So far as I know, intradermal tests on swine have never been done

on a large scale to confirm this work. Nevertheless, if the findings of these workers should be definitely confirmed, then intradermal tests in trichinous pigs would be just as specific as tuberculin tests in tuberculous cows. The opinion that has been held in the past, that we must have trichiniasis because of the inability to detect infested swine, would then be tenable no longer.

E. M. Butt, M.D. (University of Southern California School of Medicine, Los Angeles).—Our attention has been drawn to the subject of trichinosis by the startling figures obtained by a few recent workers in determining the prevalence of trichina infestation in cadavers. These figures are from widely separated localities and, excepting the report from New Orleans, indicate an incidence of trichina infestation in well over 15 per cent of the cadavers examined. Yet, as McNaught has pointed out, the vital statistics of the State of California show a very low incidence of the disease. This discrepancy has been dismissed quickly with the conclusion that, clinically, the disease is rare, and that subclinical infestation is common. However, quantitative evaluation of infestations would indicate that such an inference is not true in a certain percentage of positive cases. It follows, therefore, that patients with trichinosis are not seen medically or that our training and diagnostic methods are faulty and require scrutiny. Aside from the clinical importance of trichinosis, there is a public health aspect of utmost interest.

Recently, we have completed the examination of 150 diaphragms by the digestion method. These specimens have been taken at random from our autopsy service. The total percentage of positive findings was 17.3 per cent. Further analysis of these figures revealed a higher percentage of infestation in females than in males. This is due to the high incidence of trichina in diaphragms of colored females, a figure which in our small series was close to 50 per cent. Thirty-seven per cent of the diaphragms from Mexicans and Negroes, both males and females, were positive for trichinae.

It is still too early to adequately evaluate the diagnostic importance of the skin test. The few clinical cases that we have seen have all given an immediate positive reaction to the antigen. However, there are reports in the literature that indicate that such is not always the case. Furthermore, positive skin tests have been obtained in individuals with Trichuris trichiura infestation. So far, little attention has centered around the trichina skin test in hyperergic patients. These and other aspects must be taken into account before the skin test can be considered reliable in the diagnosis of trichinosis.

Trichinosis is a subject of considerable clinical and public health importance. Doctor McNaught's admirable paper should help to create more interest in the subject.

SNAKE VENOM: ITS USE IN POSTOPERATIVE HEMORRHAGE OF THE EYE*

By W. F. Swett, M.D.
San Francisco

Discussion *by Warren D. Horner, M.D., San Francisco; Frederick C. Cordes, M.D., San Francisco.*

THE management of postoperative hemorrhage, following major procedures on the eye, is always difficult to control, and the usual procedures are notoriously ineffective. These cases have always been a source of worry, and in my effort to find something to control this situation I was encouraged by reports of Peck [1] (1931), McFarlande and Barnett [2] (1934), and Dack [3] (1935), in their use of moccasin venom in the treatment of hemorrhagic disease.

During the past year I have had several stubborn postoperative hemorrhage cases which were responsible in my using the snake venom therapy, in an effort to find a good postoperative treatment in this distressing complication.

MOCCASIN VENOM

The moccasin venom was prepared in a concentration of 1/3000, in a physiological saline solution with 1/10,000 merthiolate being added as a preservative. According to these authors, it was efficacious in functional uterine bleeding, epistaxis, and hematuria in the Henoch-Schönlein syndrome, in thrombocytopenic purpura, in multiple heredity telangiectasis, and in hemoptysis from bronchiectatic cavities. The more recent applications have shown that the venom is excellent as a coagulent in local intractible bleeding, and was found especially effective in cases of functional uterine bleeding and idiopathic nasal hemorrhages. This led to its being used preoperatively, in patients predisposed to excessive hemorrhage, with equally good results. Hemophitic blood, which normally clotted in twenty to forty-five minutes, was clotted in seventeen seconds by a 1/10,000 dilution of venom, and has been used successfully in managing hemophiliac hemorrhages following dental extraction, tonsillectomy, epistaxis, and oozing from abdominal wounds.

In giving the venom, ecchymosis may develop at the site of injection in the first twenty-four hours, and most patients develop a reaction of hypersensitivity in approximately ten to fourteen days; however, the reaction is always local, and characterized by a hot, tender swelling at the point of injection only. No general reaction may be feared. In the six cases that I have used it on up to date, I have had no reaction whatever, either local or general.

The continuous oozing of blood from the iris or the wound into the anterior chamber, following cataract extractions, prolongs the healing and in many instances results in the failure of the wound to close, or even a painful eye with rupture of the wound and prolonged seepage from the anterior chamber.

In the first case, hemorrhage occurred the first day following operation and continued to ooze in spite of all treatment for ten days. I decided to use the moccasin venom put out by Lederle, and was very pleasantly surprised when the oozing stopped immediately after the first injection of .4 cubic centimeter. As soon as the hemorrhage was checked, the blood disappeared rapidly from the anterior chamber and the wound was closed completely four days later. I have used it in four cases since with identical results. These results have been so satisfying that I have come to look upon the venom as indispensable in the control of postoperative hemorrhage. To date I have only administered it in those cases which showed a tendency to hemorrhage after operation, and found that .5 cubic centimeter given daily for one week has been sufficient. I feel that the ideal method of use would be to give these injections previous to operation to prevent the complications rather than to correct them. I have not gone into this phase of the subject because I first wanted to demonstrate to my satisfaction the action of the venom on actively hemorrhaging cases.

* Read before the Eye, Ear, Nose, and Throat Section of the California Medical Association at the sixty-sixth annual session, May 2–6, 1937.

In one case of a severe iridocyclitis, accompanied by hemorrhage in the anterior chamber, I gave .5 cubic centimeter subcutaneously and have found that it also stopped the bleeding in the face of a severe inflammation in which no operation had been performed.

IN CONCLUSION

I am convinced that the most important point in the use of venom in postoperative hemorrhage is to give it in large enough doses to rapidly control the bleeding, and as it is not continued long enough to produce sensitization, this point need not be feared. The patients tolerate .1 cubic centimeter daily up to fourteen days if necessary, without any untoward symptoms.

In two other cases I used a dosage of .1 cubic centimeter daily for four days without any signs of hypersensitivity or local reaction.

In this small series of six cases, I believe I have demonstrated that moccasin venom has a definite place in the control of postoperative bleeding, and also has possibilities as a prophylactic procedure which may be used in intra-ocular surgery, particularly in cases where we are suspicious of having postoperative bleeding.

DISCUSSION

Warren D. Horner, M.D. (384 Post Street, San Francisco).—A snake swallows its food whole, and what could be handier for a snake than a hypodermic injection ready at all times to paralyze its prey and to assist in its digestion! This is precisely what a venomous snake has. The venom is secreted in glands homologous with the mammalian salivary parotid. It is led down to fangs which are either grooved or hollow and so placed as to pierce the thing bitten. The act of biting contracts the temporal muscle, which exerts pressure over the poison gland which forces the venom to the fangs.

The toxic action of venoms varies enormously among the different snakes.

A large group of venoms, such as those of the Indian cobra and Australian death adder, act like curare in paralyzing skeletal muscles, and death may take place from paralysis of the muscles of respiration.

Another group, chiefly of the viper family, causes death by peripheral circulatory failure.

A third group causes death by the rapid coagulation of the victim's blood, due to the presence of thrombin or kinase in the venom, which set off the clotting reaction.

Other venoms contain anticoagulating substances thought to be antikinase or antithrombin. Hence, venom from the cobra, Australian copperhead or death adder causes blood to become incoagulable, either *in vivo* or *in vitro*.

Since we are interested alone in coagulating effects, we will discuss this phase further.

As early as 1893 Martin pointed out that certain snake venoms caused intravascular clotting.

In 1903, Lamb found that citrated blood could be clotted by particular venoms.

McFarlane and Barnett,[1] in 1934, found that a 1:10,000 dilution of viper venom could be sterilized by a Birkefeld filter, was not toxic in this dilution, and had coagulating powers even in hemophilia. This dilution has been used ever since in St. Bartholomew's Hospital, London, particularly in dental extractions, tonsillectomies, oozing of viscera, such as kidney and liver, and prostatectomies.

In America, since 1931, Peck[2] has advocated the use of moccasin venom and, with Lederle, has given us a commercial supply.

Rosenfeld and Lenke (1935) have used venom of the Australian tiger snake as a hemostatic.

The exact rôle of viper venom in the process of blood coagulation has been studied.

As you remember, the clotting of normal blood follows this scheme: Prothrombin in the plasma, plus calcium salts in the plasma, plus thrombokinase or injured-tissue juice, yields thrombin, which reacts with fibrinogen in the plasma to form fibrin or clot.

Indian and Australian viper venoms contain substances which are the equivalent of a mixture of thrombokinase and calcium, which can generate thrombin and set off the clotting mechanism.

Peck and Rosenthal attribute the coagulating effect of moccasin venom either to some effect on the blood-vessel walls or on the clotting factor of the blood.

Snake venom for antihemorrhagic purposes has been given a successful trial both in London and America. Its use to prevent hemorrhage in the eye is, as far as I can determine, original with Doctor Swett, for I noted no other reference relative to its employment in ophthalmology.

There are many cases in eye surgery where the fear of bleeding or recurrence of bleeding literally haunts one. Furthermore, we have only feeble means to prevent hemorrhage, even when we fear it preoperatively. I have never felt confident that calcium or horse serum, or anything else for that matter, could be depended upon.

In snake venom we have a promising new reagent which is worthy of our trial, and we are indebted to Doctor Swett for bringing this remedy to our attention.

❦

Frederick C. Cordes, M. D. (384 Post Street, San Francisco).—Doctor Swett has called to our attention a therapeutic measure that has a definite place in our armamentarium. It offers a rapid and effective means of controlling hemorrhage in certain cases.

The control of hemorrhage comes briefly under three headings: (1) Measures to remedy any underlying constitutional cause, such as scurvy. (2) Steps to prevent the flow of blood from the bleeding vessel by the application of direct pressure, or substances that contract the vessels. (3) Consolidation of the blood.

It is primarily with the third that we are concerned in the discussion of snake venom. According to Huggett,[3] the main coagulants used in medicine may be listed in five physiological classes.

1. Thrombokinases, such as tissue or platelet extracts, preparations of brain tissue or cephalin itself.
2. Thrombin preparations.
3. Calcium variants, such as calcium salts or parathyroid extract.
4. Proteins. Foreign proteins, peptone, and the blood sera of animals have been used.
5. Physical means; carbon dioxid inhalations, extreme heat, and styptics.

The use of snake venom comes under the head of treatment with thrombins, as it has been shown that venom, particularly that of vipera russellii, contains a highly active thrombin. In addition to being a powerful coagulant, venom also produces a very strong clot. The rapidity of action is most dramatic, as Doctor Swett has stated. From the above it follows that in those cases where the bleeding results from an abnormality of the blood itself, one can expect help from the use of snake venom.

In addition to the type of case mentioned by Doctor Swett, the prophylactic use of snake venom suggests itself in those cases of apparently simple contusion of the eyeball that develop severe vitreous hemorrhages, three to five days after the injury.

I feel that this paper is of particular significance, as it is, to the best of my knowledge, the first report of the use of snake venom in ophthalmology, and one of a very few instances of the use of venom reported in the American literature.

BRUCELLOSIS OF THE MALE GENITALIA*

By Thomas I. Buckley, M.D.
Oakland

Discussion *by Morrell Vecki, M.D., San Francisco; Jay J. Crane, M.D., Los Angeles; Donald A. Charnock, M.D., Los Angeles.*

RECENT articles, published by those interested in the epidemiology of brucellosis, stress that the disease is on the increase throughout the United States.[1] For the country as a whole, the number of reported cases has steadily risen from 24 in 1925 to 1,897 in 1935, and in California 15 cases in 1927 to 148 in 1936. The true incidence is evidently higher, as these statistics were compiled from cases whose agglutination tests were positive; whereas patients have recovered spontaneously before the diagnosis was made and, therefore, have not been reported. With increasing frequency it is more than likely that genito-urinary tract complications, as a result of brucellosis, will be more numerous.

It will be the aim in this paper to call to your attention the various aspects of the disease, and emphasizing, where possible, involvement of the genito-urinary system. The care of the patient affected with this ailment is usually in the hands of the internist, except when surgical complications arise. It may be a localized genito-urinary system lesion, however, for which the patient first consults a urologist. For this reason, I believe, it is well that we have a general knowledge of the disease.

HISTORICAL

For years authors have used varied names in classifying this disease, the most common being Mediterranean fever, Malta fever, and undulant fever. Recently, the term "brucellosis" has been adopted both in this country and abroad, and this newer terminology will clarify discussions on the subject.

In 1885, David Bruce described the disease while on the Island of Malta and was the first to isolate the causative organism, Micrococcus melitensis. He also showed that 50 per cent of the goats on the island were infected, and proved that the disease was transmitted through their milk. Ten years later, Bangs, a Danish veterinarian, discovered the organism Bacillus abortus, which causes contagious abortion in cows. In 1917, Alice Evans demonstrated that Bacillus abortus and Micrococcus melitensis had similar cultural, morphological, and serological characteristics. From the work of the above three, the general term of brucella or brucella infection was applied to the whole group.

In 1924, Keefer reported the first proved case of human infection with the Brucella suis. Since then the disease has been in all parts of the country: geographically, the bovine type is somewhat uniformly distributed, while the porcine and caprine types are largely confined to specific localities. The morbidity rate is much higher in those dealing with livestock, fresh meats, and raw dairy products.

CLINICAL FEATURES

After an incubation period of one to two weeks, the first symptoms are usually those of an acute infectious disease, namely, fever, chill, profuse sweating, general muscular aches, arthritic pains, abdominal discomfort, nausea with occasional vomiting, and anorexia with loss of weight and strength. The patient has an appearance of well-being not consistent with his high fluctuations of temperature. Recovery from one to two months is the rule; however, one or more relapses is not uncommon. The mortality rate is 2 to 3 per cent, usually due to localized complications with toxemia.[2]

PHYSICAL SIGNS

Other than fever, there is often no other symptom early in the disease. Later, the spleen is frequently enlarged, and there is progressive anemia and loss of weight.[3] Doctors Hardy, Jordon, and Barts, in a paper published in the *Journal of the American Medical Association* for August, 1936, emphasize the occurrence of localized brucella infections in animals, and it is not unexpected that the same suppurative lesions occur in the human. In their article, based on 705 cases in the State of Iowa, they enumerate the more common lesions from which the brucella has been isolated, such as chronic cholecystitis, meningitis, arthritis, and lymphadenitis. Cases with initial symptoms of cystitis and renal tuberculosis have been diagnosed as brucellosis through isolation of the organism from the urine and positive agglutination tests.

LABORATORY DIAGNOSIS

The agglutination test is of the greatest value. At times, especially in the chronic cases, it may become negative, but here the skin test with brucella antigen has been found to be positive when the blood agglutination has been negative, or in lower dilutions.[4] Positive skin reactions in those working with the organisms, as laboratory technicians or veterinarians, without symptoms only indicates exposure to the disease. Recovery of the organism from the blood is positive proof, but cultures are frequently negative in acute cases. Special media for blood cultures can usually be supplied from the Hooper Foundation, where much of the work is in progress.[6] In the chronic supperative lesions the organism can be identified by serological tests after being grown on the special medias.[5]

In the blood picture there is a leukocytosis at the onset, but leukopenia with anemia soon occurs.

TREATMENT

Hardy, Jordon, and Barts, the men quoted early in the paper, summarize their views on treatment by stating that, as yet, conclusive evidence as to the value of specific therapy has not been obtained. Some feel that the brucella vaccine is of value, although it does cause a local and general reaction.

Many times the illness has an abrupt termination without any specific form of therapy being used except bed rest and supportive treatment. Complications and sequelae naturally must be handled as any other surgical condition, whether

* From the Cowell Memorial Hospital, University of California, Berkeley.

Read before the Urology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

it be in skin, bone, chest, or genito-urinary system. I have not seen or read in the literature of any suppurative lesions in the genito-urinary system in the human which needed surgery, but have seen them in the testicles of animals, causing complete destruction by abscesses. In the case I am to report, involving the testicle and epididymis of a young university student, the infection subsided without any surgery being necessary.

REPORT OF CASE

The patient, a nineteen-year-old university student, entered the Cowell Memorial Hospital (University of California Campus) March 18, 1935, complaining of a very painful left testicle associated with nausea and vomiting. He attributed the cause to football practice two days previously, but there was no definite knowledge as to any injury. On questioning, no further information of note was obtained.

Physical Examination.—Although the patient's temperature was 102 degrees Fahrenheit when he entered, he did not feel ill except for his complaint of pain in the left testicle. The physical examination, other than the left testicle and epididymis and chronically infected tonsils, was practically negative. There was no urethral discharge nor a history of ever having a discharge. The left testicle was enlarged and painful to gentle palpation. The globus minor appeared to be enlarged, soft and tender. The cord was normal in size, not nodular, and not tender.

Laboratory Findings.—Urine, normal; tuberculin, negative; Wassermann, not done; blood culture, negative; blood counts, first on March 18, 1935 (day of entry), white blood cells 14,000, polymorphonuclears 68 per cent, mononuclears 31 per cent; second on March 22, 1935, white blood cells 6,600, polynuclears 38 per cent, mononuclears 60 per cent, eosinophils 2 per cent.

This count demonstrates the fact that at the onset of the disease there is a leukocytosis, followed rapidly by a leukopenia with an increase in the monocytes. On March 26, 1935, the blood that had been sent to the State Laboratory on the Berkeley Campus, reported negative for tularemia, typhoid, paratyphoid A and B, but a positive agglutination for brucellosis of 1 :1280.

Course.—The boy did not appear ill, but his temperature fluctuated between 102 and 101 degrees Fahrenheit for six days, and on the seventh day it was 99 degrees Fahrenheit, and from then on until his discharge, was normal. The testicle and epididymis were supported by a Bellevue bridge and ice packs applied, but they remained swollen and painful for eight days, after which the swelling gradually subsided. He was discharged from the hospital fifteen days after entry with normal temperature and very little swelling or pain in the left testicle and epididymis.

Interval History.—The patient was well until October 12, 1935, when he again entered the hospital with symptoms of catarrhal jaundice. There was nausea and vomiting, abdominal cramps, and jaundice, the icterus index reaching 273. There was no fever at any time during his stay in the hospital. The agglutination for brucellosis was positive in the dilution of 1 : 640. Biliary drainage was instituted and bile was to be cultured for the brucella organism, but unfortunately the specimen was destroyed accidentally. Melitensis and abortus vaccine was given intramuscularly (.25 cubic centimeter); however, it was administered thirty-eight days after entry, and the symptoms as well as the jaundice had subsided. Two more injections of the vaccine were given after his discharge, none of them causing any local or general reaction.

COMMENT

On March 18, 1937, two years after the illness, the agglutination titer was 1 to 100. Here we have a case of brucellosis with indications that it had localized in the testicle and epididymis, to be followed ten months later by the symptoms of gallbladder disease. The question arises, "Where did this young man contract the disease?" His father owns a cattle ranch in California, but the student had not been home for nine months. It is possible that his was a case of chronic brucellosis, with very late localizing symptoms. At the time of his first entry into the hospital in March, 1935, he was working in a local restaurant where fresh livestock and dairy products were being handled. No other cases were reported from this source, nor were there any other cases reported in the county at this time, so we must say that the source of the infection was not determined.

BRUCELLOSIS IN GOATS

Through the courtesy of Dr. C. M. Haring of the Veterinary Science Department of the University of California at Berkeley, I had the opportunity of observing a goat infected with brucellosis, which had localized in the left testicle and epididymis. On autopsy, no significant lesions were found, except the following:

The left tunica vaginalis, which showed fibrous thickening, contained a moderate-sized hydrocele. The left testis was enlarged to 8 by 5 centimeters in diameter, and on cut section showed numerous necrotic and hemorrhagic areas 1 to 5 millimeters in diameter. Some were discrete and others confluent. The epididymis on cut section also showed these marked discrete necrotic areas measuring 1 to 6 millimeters, resembling caseous necrosis seen in tuberculosis.

Brucella abortus was isolated in pure culture from the hydrocele fluid, and from the parenchyma of the testicle and epididymis.

The microscopic pathology was described by Dr. Paul Michael of Oakland, whose report follows:

Pathological Report.—Microscopic examination of the testicle shows practically a complete loss of normal markings. The glandular elements appear to be replaced by inflammatory granulation tissue. There is a diffuse background of large, oval and polyhedral-shaped epithelioid cells. These cells have clear-cut membrane, pale azure cytoplasm and eccentric nuclei, with vesicular nucleoli. Interspersed through this background are clear spindle-shaped fibroblasts and some well-defined, mature fibrous tissue fibers. In addition to these cells there are numerous, scattered mononuclear cells, oval and round in shape, containing deeply stained nuclei and distinctly basophilic cytoplasm. There are also a few scattered lymphoid cells, large plasma cells, and a few polymorphonuclear leukocytes. In addition to this diffuse background there are small tuberculoid aggregations, composed of densely packed round cells, fibroblasts and epithelioid cells, with some areas of central caseous necrosis. There is an occasional giant cell observed.

Sections through the epididymis show a marked interstitial fibrosis in the stroma with distortion of the glandular elements. Most of the ducts show compression, but a few are the seat of ectasia. The stroma is rich in both proliferative fibroblasts and mature fibrous tissue. The blood vessels show some endo-arteritis, and surrounding the glands are scattered round cells and plasma cells.

SUMMARY

1. Brucellosis, a disease contracted through dairy products and livestock, is on the increase throughout the United States, and we, as physicians, should have a general knowledge of its symptoms and diagnosis.

2. A case history is presented giving the symptoms and clinical course of brucella infection, which had localized in the genital system.

3. The gross and microscopic picture of the lesions produced in animals involving the testicles and epididymis are shown.

411 Thirtieth Street.

DISCUSSION

Morrell Vecki, M.D. (450 Sutter Street, San Francisco).—Doctor Buckley has introduced a new etiologic factor, brucellosis, which has rarely been recognized and isolated in diseases of the genital tract in man. He has given an excellent résumé of the history and clinical manifestations of the disease.

In 1917, shortly after Alice Evans demonstrated that Bacillus abortus and Bacillus melitensis had similar cultural, morphologic and serologic characteristics, experimental work was begun at the Hooper Foundation in San Francisco by Meyer, Fleischner, and Shaw. It was soon demonstrated that Bacillus abortus was always present in certified milk produced in the San Francisco Bay region. Incidentally, the name "Brucella," honoring Bruce, who discovered the Malta fever organism, was proposed by Meyer and Shaw.

In 1920, while studying for my master's degree, it became my privilege to work with these investigators. Our particular problem at that time was to find out if Bacillus abortus could produce a disease similar in the monkey to that produced by Bacillus melitensis, or Malta fever germ, since it had been reported that, in the monkey, a disease was produced similar to that seen in man.

By injecting monkeys and feeding them with large doses of organisms, agglutinins were developed fairly rapidly. At postmortem examination it was possible to recover the organisms from the spleen, lymph nodes, and liver. We have no record of having recovered the organism, or having produced the disease in any part of the genital tract of these animals.

Recently, I came upon an article by Simpson, who had studied ninety cases of brucellosis in and about Dayton, Ohio. Evidence of orchitis, epididymitis, prostatitis, and seminal vesiculitis, was found in three of the patients, all being raw-milk consumers. In one case the organism was recovered from a draining sinus tract, which extended from the globus major through the scrotal wall.

In conclusion, I can state that Doctor Buckley's case report will set an example for us to be on the alert to investigate any obscure genital lesion for brucella infection.

❦

Jay J. Crane, M.D. (1921 Wilshire Boulevard, Los Angeles).—A proved case of brucella infection of the testicle and epididymis in a human has not yet, so far as I know, ever been reported. I can see no reason why the infection should not involve these structures, because other tissues are not uncommonly involved.

Doctor Buckley's interesting case report comes closer to being a proved case than has as yet reached the literature. However, the history, physical findings and course of the infection, as described, are in no way pathognomonic of a brucella infection of these structures, and without a positive culture having been obtained from the testicle and epididymis, one cannot differentiate with certainty between a nonspecific infection and a brucella infection. I, therefore, do not consider Doctor Buckley's diagnosis as positive; yet it is certainly very suggestive.

Doctor Buckley has brought to our attention the great possibility that many of the so-called nonspecific epididymitis cases may be due to brucella, which is especially true in those patients who have recurrent attacks of epididymitis; and I believe this latter group should all have an agglutination test for brucellosis, in view of the fact that the disease is on the increase.

❦

Donald A. Charnock, M.D. (727 West Seventh Street, Los Angeles).—Brucellosis is fairly common in California, especially in the agrarian districts. In reviewing the disorder, attention is directed to the numerous complications. The disease is not rare in Southern California, but there is no record of urologic complications in our largest hospital.

The description of the physical findings and the clinical course is well brought out. It is an established fact that the agglutination test remains positive for a long period of time. This test must be carefully evaluated in making a diagnosis of brucellosis.

While there have been no cases of orchitis and epididymitis reported in the American literature within the past few years, four cases are recorded in the foreign literature. Three of these cases originated in Italy and one in France.[1]

Dr. Harold J. Harris of Westport, New York, calls attention to the complication and states that it may be present in one per cent of the cases.[2]

In urologic practice we are often called upon to help identify cases of persistent fever. These cases should all be checked for brucellosis. Recently, I was called to see a case of persistent fever. Here a few pus cells in the urine directed attention to the urinary tract. Examination revealed a normal upper tract. A prostatitis accounted for the lower-tract infection. The agglutination test for brucellosis was strongly positive. The temperature returned to normal, and all of the symptoms cleared after the administration of a vaccine obtained from the Hooper Foundation.

MEDIOLATERAL EPISIOTOMY*

By George D. Huff, M.D.
San Diego

Discussion *by A. M. McCausland, M. D., Los Angeles; Hall G. Holder, M. D., San Diego; Donald G. Tollefson, M. D., Los Angeles.*

An episiotomy is the substitution of a clean, straight, carefully made cut in a known and safe place for jagged, irregular tears in unsafe and unknown places. This operation is now the most neglected obstetrical procedure. It should be used in 97 per cent of full-term primipara. The operation should be performed after the pelvic floor has been moderately stretched by the presenting part, but before damage has occurred.

TECHNIQUE

The mediolateral is used exclusively in this series. The incision is made with a sharp scalpel following the injection of one-half per cent novocain. The needle is inserted in the median raphe at the vaginal entrance and carried mediolaterally immediately under the skin for a distance of three inches. Ten cubic centimeters of novocain are injected in this area. The needle point is now drawn back to the median raphe and carried in again at the same angle, and for the same distance; but just above the urogenital septum and levator ani muscle.

1 Presti and Seminerio: Rinasc. med., 11:621-623 (Oct. 31), 1934. Benincasa: Rinasc. med. 14:260-263 (April 30), 1937. Farjot and Dumond: Soc. de méd. mil. Franc., Bull. mens. 29:290-293 (Nov.), 1935. Garcia and Ruiz: Policlinico, 42: 1912-1921 (Sept. 30), 1935.

2 Harris: J. A. M. A., 109:1300 (Oct. 16), 1937.

* Read before the Obstetrics and Gynecology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

Fifteen cubic centimeters of novocain are required for this area. Three minutes should elapse before the incision is made, to allow the novocain to spread through the tissues to be anesthetized. With the first finger of the left hand in the vagina, pulling the pelvic floor toward the operator, it is easy to locate, with the aid of the thumb, the thin round edge of the urogenital septum, and the thicker and deeper edge of the levator ani muscle. The operator now knows the tissues to be severed, their exact location, their thickness and the depth of the incision to be made in each structure. The finger remains in the vagina until the operation has been completed. The incision is started in the median raphe at the vaginal opening, carried mediolaterally and through skin and subcutaneous tissue, exposing the urogenital septum. The urogenital septum, after being identified, is severed by the second stroke of the knife. The levator muscle and fascia cannot be seen and are incised in a similar manner. The outward pressure of the finger in the vagina will cause the cut edges of the severed tissues to separate, and at the same time the pressure will control bleeding. Finally, the incision is made along the vaginal floor for a distance of about two inches. Bleeding vessels should be clamped and tied as in any other operation. The dissection is now complete.

INFECTION

After the baby has been delivered, it is of the greatest importance to redrape the field of operation. Direct infection from the rectum must be avoided. Great care must be exercised to prevent the ends of the sutures from touching the rectum, or some contaminated area. Gloves should be changed before starting the repair.

REPAIR

The skin, subcutaneous tissue, urogenital septum, levator fascia, levator ani muscle, and the vaginal floor must be clearly recognized. The incision was started in the skin and carried inward, layer by layer, toward the vaginal floor. The repair is started in the vaginal floor and carried outward, layer by layer, until the skin has been closed. The incision is held open by a Gelpi retractor. Chromic catgut No. 2 is used exclusively. The apex of the vaginal floor incision is picked up with an Allis clamp. The suture is inserted and tied around the clamp to prevent bleeding from the angle. The suture is then carried, in a continuous manner, down to the mucocutaneous junction at the opening of the vagina. The rounded edges of the urogenital septum on each side of the incision are grasped by Allis clamps and pulled well up toward the symphysis, bringing all the severed structures into view. The first step in closing the urogenital septum and levator ani muscle is to place a suture just to one side of the deepest point of the incision in these structures, and be sure the suture passes through both layers of the urogenital septum, the levator fascia, and levator ani muscle. The suture must be passed through the same structures on the opposite side of the incision but, of course, in the reverse order. It is important not to allow this first deep suture to pass through the rectal wall, but to make sure it passes through both layers of the septum, levator ani fascia, and muscle on both sides of the incision. The Gelpi retractor is partly released and this suture is tied. Similar interrupted sutures are placed three-fourths of an inch apart, until the upper edges of the urogenital septum have been brought firmly together. The subcutaneous tissue is closed with a continuous suture. The skin is closed with a continuous subcuticular stitch, starting at the apex of the skin incision and ending at the mucocutaneous junction. This suture is tied to the one closing the vaginal floor, which leaves no sutures or knots exposed near the rectum.

RESULTS IN FOUR HUNDRED AND TWELVE PRIMIPARA*

Primipara studied	412
Severe infection, two	0.46%
Mild skin infection, twenty-six	6.3 %
Healed but followed by relaxation, thirteen	3.1 %
Hematoma, one	0.23%
Marked pain, two	0.46%
Satisfactory results	89.5 %
Vaginal dilatation before sexual relation could be resumed	35.0 %

CONCLUSIONS

1. This operation should be respected.
2. Good results can be obtained, and will soon be demanded by patients.
3. The mediolateral is one of choice.
4. A slow, deliberate, painless, and scientific operation can be done under local.
5. Each structure can and should be recognized before cutting.
6. A sharp scalpel should be used.
7. All bleeding should be controlled, as in any other operation.
8. The wound should be watched and treated by the doctor and not by the student nurse.
9. Patients have been pleased with this method.
10. A definite fee should be charged for this operation.

806 Medico-Dental Building.

DISCUSSION

A. M. McCausland, M. D. (3780 Wilshire Boulevard, Los Angeles).—The general use of analgesia today has resulted in increased elective low-forceps deliveries, with a corresponding increase in episiotomies in multiparae as well as in primiparae. In addition to the many other reasons and indications already discussed, may I point out that, if the episiotomy is done early, lacerations in the region of the urethra, clitoris, and vestibular bulbs may usually be prevented. Thus, hemorrhage in these locations, which is often difficult to control, is avoided and, still more important, scarring and adhesions about the clitoris, which frequently result in frigidity. Therefore, episiotomy as a routine procedure is the rule rather than the exception in the practice of modern obstetrics. The gratifying results to both patient and physician have firmly established it in its proper place.

With the increase of surgery in the perineal region, a clear understanding of the anatomy involved is of vital importance. Because of the many structures involved, their intricate relationships, and the confusing terminology, the average physician does not possess the same knowledge of the anatomy of this region that he does of other regions of the body.

* In private practice.

If the perineum is considered as the "inferior abdominal wall" with layers as definite and as important as the layers of the "superior (or anterior) abdominal wall," greatly improved results from surgery in this region are inevitable. A general surgeon would not close the "superior abdominal wall" without first identifying any approximately like structures, and yet, too frequently, a repair of the perineum is done by those who do not possess knowledge of even the essential anatomy of the region.

That faulty closure of the "superior abdominal wall" often results in incisional herniations is generally recognized; but obstetricians frequently fail to realize that faulty closure of the "inferior abdominal wall" almost invariably results in pelvic herniations such as rectoceles, cystoceles, urethroceles, and varying degrees of prolapse.

The layers that must be approximated may be summarized briefly as:

(1) Vaginal mucosa; (2) pelvic diaphragm; (3) urogenital diaphragm; and (4) skin.

When the bulbocavernosus muscles, which lie in the anterior compartment of the urogenital diaphragm, are approximated by the well-known "crown stitch," the result is a vaginal tone similar to that in a nulliparous woman.

The pudendal nerves are the chief source of muscular and cutaneous innervation in the perineum. These nerves readily lend themselves to local block due to their accessibility as they course through Alcock's Canal, which is on a level above the lower margin of the ischial tuberosities. The blocking of these nerves relaxes and anesthetizes the perineum, and is often used in conjunction with the infiltration method as described by Doctor Huff.

❦

Hall G. Holder, M. D. (1107 Medico-Dental Building, San Diego).—Modern obstetrics emphasizes episiotomy after elective low-forceps as proper procedure in primipara, in the best interests of mother and new-born. So widely has this teaching been accepted that it has become the rule rather than the exception. I will not labor this point, as I wish to indicate the value of this paper from a purely gynecological standpoint. The gynecologist sees all too many poorly done episiotomy repairs with associated perineal relaxation and subsequent gynecological sequalae. The statement has been made by older gynecologists that 60 per cent of gynecological surgery was incident to poor obstetrics and birth trauma. Episiotomy and elective low-forceps deliveries in particular were designed to avoid much of the sequelae of former years. Under proper management this is undoubtedly true; so we are indebted to Doctor Huff for his emphasis on episiotomy repair, the weak link in obtaining optimum results.

Episiotomy has been too lightly regarded as a most important operation, in fact, the most important in the conduct of the delivery, considering the future comfort and health of the mother. We, therefore, see many poorly executed and poorly repaired episiotomy incisions resulting in perineal relaxation comparable, or worse, than the results formerly obtained without its use and followed by the usual complications.

From a gynecological standpoint Doctor Huff's paper is timely in pointing very clearly to those employing episiotomy the necessity for accurate technique, if the best results are to be obtained and much subsequent morbidity avoided.

❦

Donald G. Tollefson, M. D. (511 South Bonnie Brae Street, Los Angeles).—Doctor Huff's presentation of the technique of mediolateral episiotomy calls our attention to a procedure which has been greatly neglected. It is an operation and should be performed as one.

The use of a scalpel has the advantage of a clean, sharp incision over the jagged irregular separation of tissue produced by a scissors. It allows better delineation of the various layers which permits a more accurate anatomical approximation. The elimination of external, nonabsorbable sutures might be criticized by those who feel that skin separation would be too apt to occur. This will seldom happen if asepsis is maintained and hemostasis is assured. The advantages as enumerated warrant the trial of this very complete, yet practical technique.

REGIONAL ANESTHESIA FOR ORTHOPEDIC OPERATIONS*

By Charles F. McCuskey, M.D.
Glendale

Discussion *by Alfred Edward Gallant, M. D., Los Angeles; Hugh Jones, M. D., Los Angeles.*

THE routine use of general anesthesia by orthopedic surgeons has been quite universal. This has been due in great part to lack of familiarity with regional technique and failure thereby to obtain complete anesthesia when operations have been attempted with regional block. We have no anesthetic agent or method that assures perfect results in every instance. In many orthopedic procedures regional anesthesia offers the patient greater safety and comfort during and after the operative procedure than can be obtained with any form of general anesthesia.

Three primary factors enter into the successful use of regional anesthesia:

1. Preliminary medication selected to meet the requirements of each case.
2. Potent, freshly made solutions of the anesthetic agent, of proper concentration.
3. Skillful blocking of the operative area.

PRELIMINARY MEDICATION

Preliminary medication plays an important part in the success or failure of any type of anesthesia. In regional anesthesia we try to give sufficient medication to allay nervousness and fear, but not enough to make the patient irresponsible and uncoöperative. To accomplish this the dosage must be selected for each patient. A combination of one of the barbituric acid derivatives and a narcotic will usually prove adequate. In some instances it has seemed advisable to give a hypodermic of morphin about one and a quarter hours prior to the injection, followed in about thirty minutes with a barbiturate. This gives us the advantage of the narcotic effect for the painful injection and allows the full effect of the hypnotic during the operation, when the patient is free from painful stimuli.

SOLUTIONS

Procain is our safest and best regional anesthetic agent. To avoid error and failure to obtain anesthesia due to injection of improper solution, it is advisable to prepare fresh solutions for each case. This is much more satisfactory than depending on novocain solutions prepared by some member of the surgical nursing staff, or by local pharmacists. By using 5 cubic centimeter sterile ampoules of 20 per cent novocain as put out by the larger pharmaceutical houses, this is a simple procedure. One of these ampoules diluted to 50 cubic centimeters with normal saline gives a 2 per cent solution, 100 cubic centimeters, 1 per cent, and 200 cubic centimeters, 0.5 per cent. Approximately

* Read before the Anesthesiology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

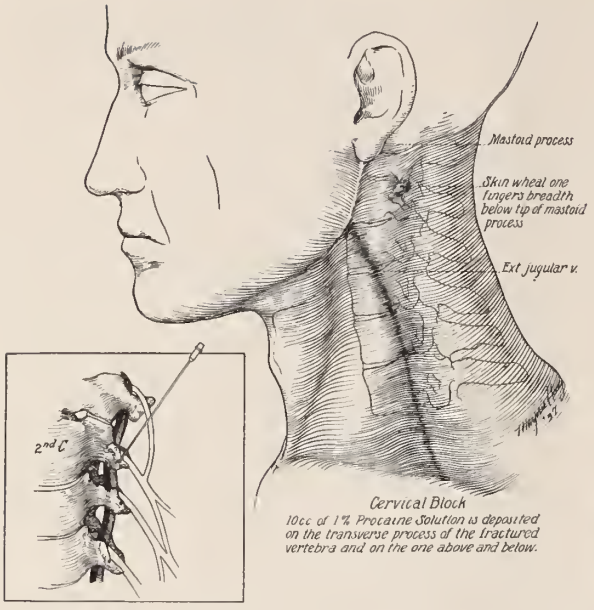

Fig. 1.—Deep and superficial landmarks for cervical block.

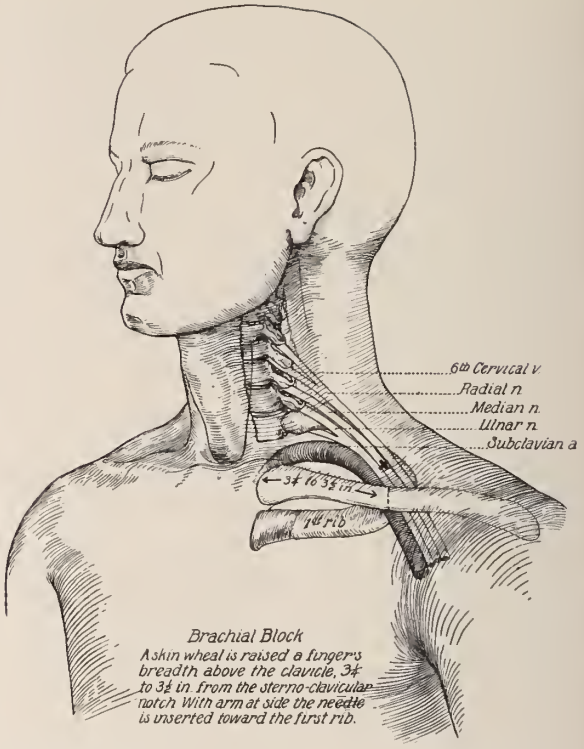

Fig. 2.—Position of clavicle and first rib in relation to brachial plexus.

6 minims of adrenalin is added to each ampoule for its local vasoconstrictor action, except when the patient is suffering from a toxic thyroid condition, or severe myocardial damage. The solutions should be at about body temperature when injected. Warmer solutions produce anesthesia more rapidly than cold, due to a more rapid absorption; but the duration of the anesthesia will be reduced proportionately.

SKILLFUL BLOCKING

Patients are not capable of judging whether they have had a good or bad general anesthetic. When they remain conscious throughout the entire operative procedure, as they do with regional anesthesia, they are the best judges of the success or failure of the method. Most patients are willing to stand some discomfort during the injection. If the operative procedure following this is also painful, we cannot expect them to be enthusiastic boosters for the method.

The novocain solution should be deposited in close proximity to the nerves with as few needle punctures as possible. The anesthetist making the injection should be sufficiently familiar with the operative procedure to assure anesthesia of the entire operative field. Failure to have anesthesia of a very small area may result in the total failure of an otherwise satisfactory block.

CERVICAL PLEXUS BLOCK

The use of block anesthesia of the cervical plexus is limited in orthopedic surgery to laminectomy and the reduction of fractures or dislocations of the cervical vertebrae. It offers a greater margin of safety for the reduction of cervical fractures than any other type of anesthesia. With the patient conscious and able to coöperate, it is possible for the surgeon to tell immediately if he should overcorrect the deformity and cause compression of the cord where none existed previously. For this procedure 10 cubic centimeters of 1 per cent novocain is deposited on the transverse processes of the fractured vertebrae and of the one above and below. The method of approach to the processes is determined by the location of the fracture and the patient's condition. Whenever possible the lateral approach as described by Labat is the one of choice. (Fig. 1.) If the sixth or seventh cervical vertebrae are involved, they may be approached from either the lateral or posterior position. In the posterior position a technique similar to paravertebral block in the upper thoracic region is used.

OPERATIVE PROCEDURES ON THE ARM

Regional anesthesia is the method of choice for long operative procedures on the arm. Anesthetic shock for long operations is reduced to a minimum, and when the injection is made correctly, the operative procedure is painless. It is particularly indicated for emergency traumatic surgery, as there is always an increased risk in administering an inhalation anesthetic to a patient that has not been properly prepared and premedicated.

Of the regional procedures that may be used on the arm, this discussion will be limited to brachial plexus block; although, for some cases, blocking of the nerves at the elbow or wrist may be sufficient. Brachial plexus block gives complete anesthesia of the entire forearm; if anesthesia of the shoulder, or upper arm, is desired, it can be obtained by placing a superficial injection around the shoulder, or upper arm, as indicated. The anesthesia obtained will ordinarily last for one and one-half hours from the completion of the injection. If the need for a longer period of an-

esthesia is anticipated, the needles may be left in place and additional novocain added as necessary. By this means anesthesia has been maintained for tendon repair for over four hours.

The technique for brachial plexus block is one of the easiest of our regional procedures, if one will keep in mind the important anatomical structures. The chief difficulty is encountered in accurately locating the mid-point of the clavicle, and in depositing the solution at the proper depth. If it is possible to palpate the subclavian artery, this difficulty is immediately overcome, as the injection can be made just lateral to it. The sternoclavicular junction can always be palpated easily; and if a wheal is raised a finger's breadth above the clavicle, three and a quarter to three and a half inches from the sternoclavicular articulation, this will practically always be over the plexus. The patient's arm should be at the side, and not extended on an arm board. (Fig. 2.) The needle is then inserted toward the first rib. If paresthesia is obtained to the hand, the injection is made immediately. By keeping in mind the relationship of the nerve trunks, it is easy to decide whether to move the needle inward or outward from the midline, as the ulnar trunk lies closest to the artery. Thus, if paresthesia is obtained to the thumb and forefinger, the next needle is inserted slightly closer the midline for the ulnar branch. If no paresthesia is obtained, the needle is withdrawn about one centimeter from the rib and the 2 per cent procain solution is deposited at that level. From 20 to 30 cubic centimeters of solution placed at the proper depth will spread over quite an area, so that paresthesias are not essential for obtaining complete anesthesia.

In a series of forty brachial blocks during the past three years, one was for open reduction of the clavicle, one for shoulder operation, one for Dupuytren's contracture, and the rest were for open or closed reductions of fractures of the upper or forearm and tendon sutures. In one instance where an open reduction at the elbow was done, a second operation became necessary and the patient requested this type of anesthesia. Satisfactory anesthesia was obtained in all of these patients for one and one-half hours, except in the case of one closed reduction, and that patient's fracture was reduced without the use of general anesthesia.

PARAVERTEBRAL BLOCK

Paravertebral block is a method to be considered for laminectomys for any purpose, and for Hibbs and Albee operations in particular. When used for the Albee operation, it is also necessary to block an area over the tibia for removal of the bone graft. Due to the restriction of breathing when it is necessary to operate upon patients lying on their face, our choice really lies between general anesthesia, using the intratrachial technique, and regional anesthesia. Considering the safety of the patient during the operative procedure, regional anesthesia is the method of choice. The dangers of postoperative anesthesia complications are also greatly reduced.

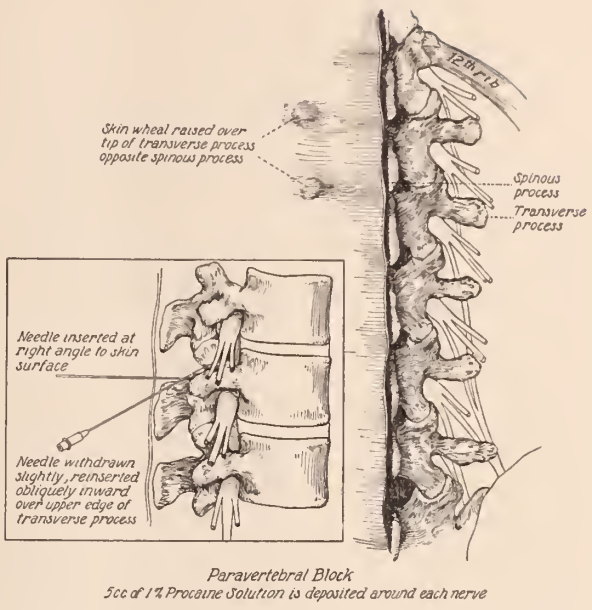

Fig. 3.—Superficial and deep landmarks for paravertebral block in the lumbar region.

The technique of paravertebral block varies slightly, according to the area involved. In the lumbar region the transverse processes lie directly opposite the intraspinous notch, and the skin wheal is raised at this point about an inch from the midline. (Fig. 3.) As we ascend the vertebral column, the wheals are raised about an inch from the midline, but higher in relation to the notch until, in the upper thoracic, they are raised opposite the spinous process itself.

The needle is first inserted at right angles to the skin until it makes contact with the transverse process. It is then withdrawn and reinserted, inward and upward over the edge of the transverse process. Approximately 5 cubic centimeters of 1 per cent novocain is injected around each nerve. The line of incision may then be infiltrated with .5 per cent procain as an adjunct to the anesthetic, and to promote hemostasis. This procedure is not essential, and if there is any contraindication it may well be omitted.

Paravertebral block is also of value in the reduction of vertebral fractures, and has the same advantages as cervical block for this purpose.

CONCLUSIONS

Regional anesthesia offers the patient greater safety for the orthopedic procedures enumerated than general anesthesia.

The dangers of postoperative pulmonary complications are eliminated, except those that are embolic in origin.

When the novocain solution is placed properly, operative procedures may be performed without pain.

Anesthetic and operative shock are reduced to a minimum.

1561 Puebla Drive.

DISCUSSION

Alfred Edward Gallant, M.D. (727 West Seventh Street, Los Angeles).—Doctor McCuskey's paper offers a very interesting phase of anesthesia for orthopedic operations, and a practical application of what he has stated and outlined is of much value because it allows the surgeon a better facility for performing his work. It has been found that regional anesthesia minimizes the possibility of shock, especially in those cases which are bad risks. In the past four years we have employed this method in about thirty cases in which Doctor McCuskey provided the anesthesia technique. To cite a few of these cases, a woman who had both bones of the left forearm fractured and a fracture of the left patella, regional anesthesia was given, under brachial block for the correction of the forearm fractures, and a femoral block for the patella fracture. There had been a head injury in this case, and I am of the opinion that an ether anesthesia would not have been a satisfactory method. The use of the regional blocks proved to be of much advantage. A second instance, a man with a spiral fracture of the humerus, brachial block was employed. This man had been a heavy drinker, and it was certain that recumbency, if the Bardenhauer method had been employed, would not have been satisfactory. The regional block allowed us to apply a shoulder spica and the patient became ambulatory. Another instance of a comminuted spiral fracture of the right humerus in a young woman where a head injury had also existed, made a satisfactory handling of the case a relatively simple procedure. A spiral fracture of the shaft of the humerus in a woman over eighty years of age was satisfactorily reduced. Patient was allowed to become ambulatory, and much more comfortable than in cases where there were recumbency and extension. Another instance, a man of eighty-four years of age with fractures of both tibiae, and right humerus, involving the elbow joint, a very bad risk and treated with regional anesthesia, resulted in satisfactory reduction and outcome. Therefore, I am of the opinion that regional anesthesia will gradually become more universally used because of its possibilities in orthopedic problems.

❋

Hugh Jones, M.D. (201 Medical Office Building, Los Angeles).—More extensive use of regional anesthesia in orthopedic operations will probably come about as anesthetists perfect the technique to the point where the surgeon and patient can confidently expect a painless operative procedure. The surgeon himself may be able to acquire this skill; but in general it is better to trust this work to an anesthetist whose experience is such that satisfactory anesthesia can be counted upon regularly.

The cervical plexus block for manipulating fractures of the cervical spine has been very comforting to me, because I have felt very uneasy about assuming the responsibility in such a case, with the weight of the head and relaxed neck as it hangs with the helpless patient under general anesthesia.

The brachial plexus block has been very helpful, indeed, for time-consuming tendon and nerve repair. A particular advantage is usually found in the ability of the patient to contract the various muscles, and this helps in the identification of the different tendons. This voluntary control is also appreciated when it is possible to try out the return of function before closing the wound. Leaving the needle in place to reinforce waning anesthesia, is an advantage easily appreciated.

More frequent use of paravertebral anesthesia should be made in the Hibbs and Albee operations, as well as for laminectomy. For the Albee operation, the leg can well be anesthetized by surrounding the operative site for the removal of the graft from the shin.

In emergency work one feels much safer about a patient with a full stomach, if the dangers incident to vomiting while under the anesthetic can be avoided. Local anesthesia provides this factor of safety.

COMPENSATORY PRESSURE IN ANESTHESIA FOR THORACIC SURGERY*

By W. Lawrence, M.D.
San Francisco

Discussion *by William Neff, M.D., San Francisco; G. D. Delprat, M.D., San Francisco.*

OCCASIONALLY, during the task of administering an anesthetic one is confronted by a sudden crisis which threatens the safety of the patient, disturbs the surgeon, and chills the spine of the anesthetist. At a time such as this it is essential to analyze the situation promptly and to institute the proper corrective measures. This is especially true when seemingly indicated readjustments in the anesthetic fail to produce the desired result.

Such a sudden crisis may occur during operations upon the thorax which necessitate the opening of a hole of any considerable size in the chest wall. The following is somewhat the order of the train of events as they take place:

A patient under nitrous oxid anesthesia, reinforced by local infiltration, chloroform, cyclopropane or intravenous barbiturates, may be breathing quite evenly and showing no signs of either anoxemia or overdosage of anesthesia. When the thorax is opened, however, the respiratory rate increases, the depth of breathing increases, the pulse rate and pulse volume increase and cyanosis appears. An increase of the oxygen flow to the patient is the first consideration, and is promptly provided. The desired evidence of oxygenation does not result. Cyanosis becomes deeper and asphyxial spasm begins to manifest itself. The pulse becomes more rapid and more feeble. The pupils dilate and the skin becomes mottled. Suddenly, just at the moment when oxygen in the lungs is of the utmost importance, the anesthetist is confronted with the most distressing of all conditions in inhalation anesthesia, *i. e.,* spasm of the glottis and of the respiratory muscles. That death does not more often supervene is undoubtedly due to the fact that, after the fatigue of the prolonged asphyxial spasm, a sufficient relaxation of the glottis occurs to permit the anesthetist to force a small amount of oxygen into the lungs under pressure, and the patient revives with evidence of considerable shock. The abruptness with which the foregoing disturbance breaks into the course of the anesthesia is probably the reason why deaths at this point have been variously ascribed to embolism, acute dilatation of the heart, shock, collapse of the trachea, or status lymphaticus.

Convinced that the foregoing syndrome was, in most cases, due entirely to oxygen-want carried to the stage of asphyxia, I began to use increased pressure in the breathing bag promptly at the time the chest wall was opened, or when its rigid structure was disturbed by a resection of the ribs. The result of maintaining pressure during this period of the operation is so gratifying that I feel the subject is worthy of emphasis before this group.

* Read before the Anesthesiology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

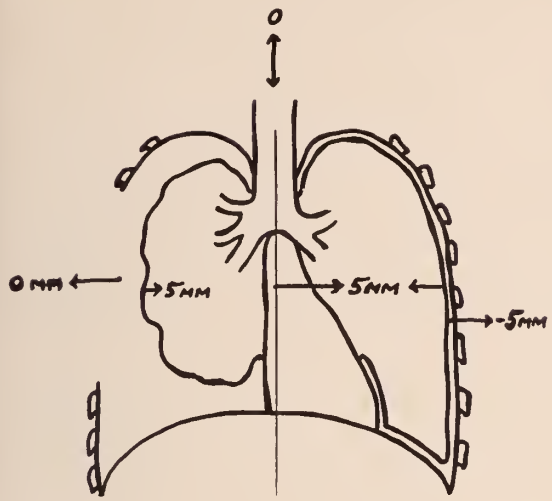

Fig. 1

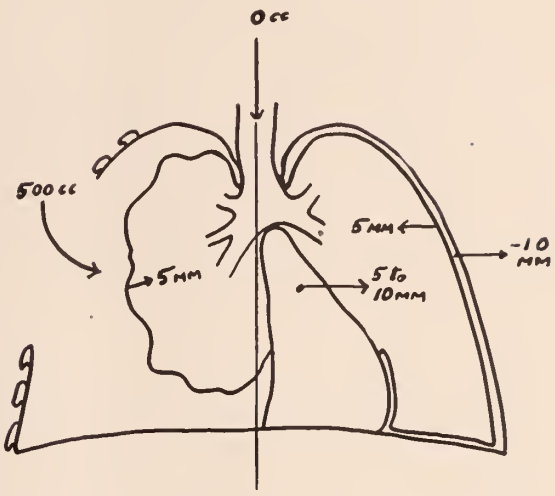

Fig. 2

Fig. 1.—Illustrating status of intrathoracic pressures during rest—right thoracic wall open. Intrapulmonary pressure 0.

Fig. 2.—Illustrating ineffectiveness of inspiratory effort when thorax is open. Intrapulmonary pressure 0. Note mediastinal displacement.

NORMAL ANATOMY AND PHYSICS OF INTRATHORACIC PRESSURE

When the thorax is at rest there exists in the potential pleural space a vacuum of 5 millimeters of mercury. This 5 millimeters vacuum is produced by the centripetal pull of the lungs, due to their own elasticity opposed by the semirigid structure of the rib-cage and diaphragm at the limit of relaxation. The mediastinum remains in the midline because the pull upon it is equal in both lateral directions.

Upon inspiration the intrapleural vacuum is increased to 10 millimeters of mercury, due to the enlargement of the chest cavity by the raising and expansion of the rib-cage and the downward movement of the diaphragm. The 5 millimeters centripetal contraction tendency of the lung is overcome by the 10 millimeters vacuum, and the lungs fill. The mediastinum remains balanced in the midline position.

It is pertinent to observe here that the flaccid contents of the mediastinum, and its somewhat narrow anterior and posterior attachments, make it a quite movable structure.[1] In the cadaver with normal lungs it has been observed that the mediastinum will move some three inches to the left and some two inches to the right from the normal midline position.

Another anatomical consideration to be borne in mind is that the area of the normal glottis is about 2.5 to 3.0 square centimeters.

DISTURBED INTRATHORACIC PRESSURES

Assuming that an opening of considerable size is made in the right thoracic wall, and the left remains intact, it becomes evident that the intrathoracic pressure relationships are promptly disturbed. At rest the negative pressure in the right pleural cavity is now zero and the 5-millimeter pull of the left lung displaces the mediastinum somewhat to the left. (Diagram 1.)

The physics of the failure of the respiratory system becomes evident upon consideration of a diagram of the open thorax during inspiration. (Diagram 2.) The inspiratory effort results in an ingress of air into the right pleural cavity as the thorax expands, the air taking the course of least resistance. The mediastinum is displaced further to the left by the 10 millimeters vacuum of the left pleural cavity which is now added to the 5-millimeter contracting pull of the left lung. Against these forces there is now no balancing pull in the right thorax. The mediastinal displacement thus makes the inspiratory expansion of the left thorax almost entirely ineffective, in so far as aeration of the left lung via the trachea is concerned.

Thus the quantity of air or gas entering the unoperated lung under the foregoing conditions will be in inverse ratio to the disproportion between the opening in the chest wall and the opening of the glottis, *i. e.*, if the disproportion is great the amount of air or gas entering the left lung will be small. It has been estimated that the limit of disproportion between the size of the opening in the glottis and the opening in the chest wall, which is compatible with life, is as one to twenty. In other words, if an opening is made in the chest wall having an area of more than 50 square centimeters, the patient will die within a short time of asphyxia in an ordinary atmosphere.[2]

During the expiratory phase of the respiratory cycle the mediastinal structures move to the right, and the air is emptied from the right thoracic space through the thoracotomy opening, and the status is again as described during rest.

The side-to-side movement of the mediastinum with respiration has been referred to as "mediastinal flapping," and is comparable to the vigorous movement of the slack sails of a yacht as the air pressure shifts alternately from side to side.

It becomes evident that, with an insufficient exchange of anesthetic gases having a lowered oxygen

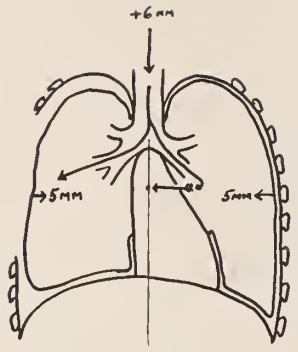

Fig. 3

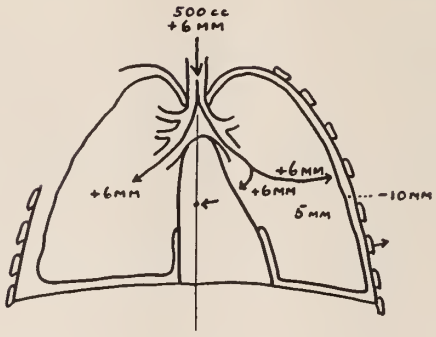

Fig. 4

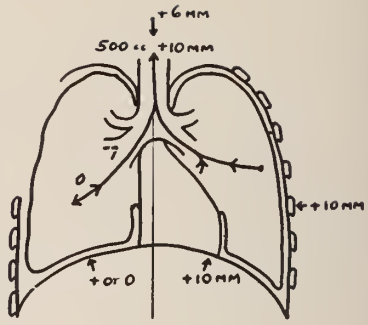

Fig. 5

Fig. 3.—Illustrating effect of increased intrapulmonary pressure during rest when thorax is open. Note indicated mediastinal stabilization.

Fig. 4.—Illustrating effect of increased intrapulmonary pressure during inspiration when thorax is open. Note indicated mediastinal stabilization.

Fig. 5.—Illustrating expiration against increased intrapulmonary pressure. Right lung remains inflated, mediastinum stabilized and the left lung emptying.

percentage, between alveoli and breathing bag the patient must of necessity very soon progress into a state of anoxemia, if a correction is not made to offset the disturbed intrathoracic pressure relations. The overactivity of the respiratory muscles, and the generalized muscle spasm which follow, cause an increased metabolic rate which still further increases the deficit between oxygen requirement and oxygen supply. Furthermore, the spasm of the glottis, which almost invariably accompanies anoxemia, also impedes the exchange of gases between lungs and breathing bag.

It is quite the natural thing for the anesthetist, having increased the oxygen flow to the patient, to be lulled into a false sense of security. This will of necessity be of brief duration because, in a matter of seconds, the patient passes through a convulsion and into a state of complete asphyxia. The pupils dilate, the skin becomes mottled, respiratory efforts cease, and the pulse becomes imperceptible. The fact will bear repeating that the unbelievably sudden climax of the syndrome makes one feel, erroneously, that the disturbance must be circulatory in nature and the etiology something akin to embolism.

The so-called "paradoxical breathing," manifested after closure of the wound, undoubtedly belongs in this classification of disturbed intrathoracic pressures. The flaccid operated side falls inward with inspiration and moves outward with expiration. The mediastinum probably exhibits the same undesirable lateral movement seen when the chest is open. I have observed rather severe anoxemia resulting from this condition at the close of thoracic operations.

FACTORS INFLUENCING DISTURBED PRESSURES

Fixation of the mediastinum by disease, thickened pleura, accommodation resulting from long-standing treatments, such as pneumothorax, pleural adhesions, and probably other more obscure factors, serve to neutralize to some extent the disturbance of intrathoracic pressures by operations.

COMPENSATORY PRESSURE

The Sauerbruch chamber was designed to create the vacuum necessary to offset the disturbance of intrathoracic pressures resulting from opening the chest wall.[3] It consists of an air-tight, steel chamber from which sufficient air may be pumped to create the desired vacuum on the inside of the chamber. The patient's body and the entire operating team are inside the chamber, and the patient's head and the anesthetist are outside. As may be readily imagined, the apparatus is cumbersome and expensive.

Since it makes no practical difference, so far as end-results are concerned, whether the difference in pressure is obtained by lowering the extrapulmonary pressure or by increasing the intrapulmonary pressure, it is certainly more feasible to employ the latter means of making the readjustment. For this purpose the Brauer high-pressure apparatus[3] was devised. It is also unnecessarily complicated.

We have been able to obtain a satisfactory stabilizing effect upon the mediastinum and aeration of the nonoperated side by maintaining a pressure just sufficient to overcome the 5 millimeters centripetal contraction tendency of the lungs. A pressure of about 6 millimeters of mercury has been quite sufficient in most cases.

The essential features of a satisfactory set-up for the successful maintenance of compensatory pressure are as follows:

1. A clear airway.
2. Air-tight connections in apparatus and between face and mask.
3. Pressure gauge in the circuit.
4. Absorber to dispose of expired carbon dioxid.
5. Accurate oxygen flow gauge.

An increased flow of oxygen and anesthetic gases may be maintained to offset small leaks in the apparatus and about the face.

With this arrangement the pressure throughout the entire system and into the patient's lungs is built up until the desired level is reached and maintained so until the thorax is closed.

During rest the pressure serves merely to hold the mediastinum in the normal midline position. (Diagram 3.) The lung on the open side, having partially collapsed, appears to withstand more pressure than we would suppose, for we have not

observed dangerous overdistention at even a pressure of 7 millimeters.

The effectiveness of sustained pressure becomes most evident during inspiration. (Diagram 4.) It now serves to hold the mediastinum steady in the midline position, while it also inflates the left lung to the limits of the expanded thoracic cavity. Gases bearing fresh oxygen thus enter the left lung. The right lung remains inflated and immobile. Whatever undesirable effect there may be upon the right lung from distention must be tolerated for the time being.

During the expiratory phase of the cycle the resilience of the left thoracic wall and diaphragm, plus the 5 millimeters contracting tendency of the left lung, are sufficient to overcome the 6 millimeters positive pressure of the breathing bag, and the atmosphere of gas in the left lung is propelled back into the breathing bag through the carbon dioxid absorber. The right lung and the mediastinum are held stable in their previous positions. (Diagram 5.)

A prompt improvement in an anoxemic patient's condition will be noted immediately upon the institution of sustained compensatory pressure sufficient to overcome the centripetal contraction tendency of the lungs, and sufficient to immobilize the mediastinum.

Pressures beyond 10 to 12 millimeters of mercury will result in rupture of the alveoli, and should be avoided.

Asphyxial symptoms may also appear during local or intravenous anesthesia, although not so rapidly as when the atmosphere has been reduced to a ten per cent oxygen content, as in nitrous oxid anesthesia. I have observed the onset of asphyxia while administering continuous intravenous anesthesia for thoracoplasty, and have corrected the condition by strapping on a mask and supplying the needed compensatory pressure while continuing the injection.

There is no doubt but that the involuntary effort of breathing against pressure must of necessity exhaust the patient after a short time, and certainly the operation should be terminated with the greatest possible speed.

Although I have been using the ordinary rubber-cushioned face mask strapped to the head, occasionally intubating the trachea transnasally with McGill tubes, with much success, I feel that the method can stand considerable improvement. The following is a technique which appears to have many good features, and which I hope to give a trial in the future:

A SUGGESTED TECHNIQUE FOR COMPENSATORY PRESSURE

1. Premedication with a large, but safe, dose of some barbituric acid derivative one and one-half hours preoperatively.
2. Morphin and hyoscin forty-five minutes preoperatively.
3. Anesthetization of the pharynx and larynx with a spray.
4. Intravenous barbituric acid derivative sufficient to give good relaxation of the jaw.
5. Intubation of the trachea, with a semi-rigid tube with an inflatable cuff to seal the space between the tube and the wall of the trachea (as described by Waters).[4] Intubation of the bronchus to the good lung would probably be an advantage in cases of bronchial fistula or bronchiectasis.
6. Inhalation anesthesia with nitrous oxid reinforced by chloroform, cyclopropane, or ether.
7. Suction to evacuate pus, blood, or mucus from the accessible branches of the bronchial tree beyond the end of the endotracheal tube.
8. Compensatory pressure during the periods of disturbed intrathoracic pressure.

SUMMARY

1. Normal thoracic pressures and anatomy relating to anesthesia have been reviewed.
2. The physics and anatomy of disturbed intrathoracic pressures and the ill effects thereof have been discussed.
3. The effects and method of instituting compensatory pressure have been described.
4. A technique is suggested for handling cases for thoracic surgery.

DISCUSSION

William Neff, M.D. (Stanford University Hospital, San Francisco).—Doctor Lawrence has given us a most interesting paper on a subject which should be the concern of every anesthesiologist. When so many drugs, both volatile and nonvolatile, and techniques, ranging from intravenous barbiturates and endobronchial or endotracheal gases to subarachnoid block, are recommended for anesthesia in intrapleural surgery, it is apparent that all have their shortcomings. Regardless, however, of the agent or the technique, there is general agreement that compensatory pressure should be used. Dr. Harry Shields, senior anesthetist to the Toronto General Hospital, and Dr. I. Magill of London are two of the outstanding anesthesiologists who advocate the use of spinal anesthesia for intrapleural surgery. They have observed that if anesthesia to the third thoracic segment is produced, circulatory shock is far greater when the abdomen is opened for gall-bladder surgery than when the pleura is opened for intrapleural surgery. These observations, emanating from such keen minds, are worthy of further study. Endobronchial anesthesia is still in the experimental stage. One must seriously consider the partially collapsed lung which is blocked, but in which the blood supply still remains. It is clinically most difficult, if not impossible, even when agents are used which permit double the atmospheric concentrations of oxygen, or increased pressure is also maintained, to prevent the symptoms of oxygen lack. Dr. E. Rovenstine of the Department of Anesthesia at Bellevue Hospital, recommends total blocking of a bronchus, not to exceed eight minutes, until the ligature has been applied. It should be remembered, also, that intubation of the left bronchus, with a thin-walled, large lumen tube is not easy.

Direct vision endotracheal intubation with a large lumen, thin-walled tube surrounded by a Waters-Guedel inflatable cushion, under inhalation anesthesia, is the method which, because of its controllability, appeals to me most. To produce adequate pressure to approach a more rigid mediastinum, the application of hand pressure to an already moderately distended breathing bag attached to a Waters (to and

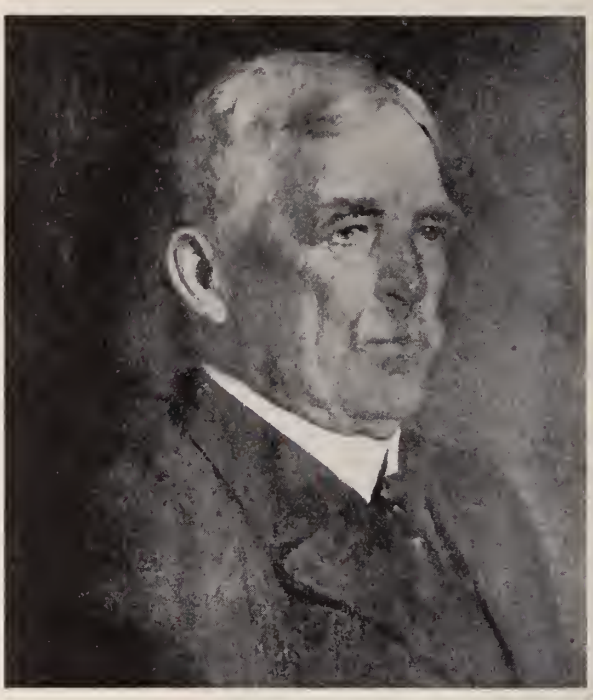
fro) soda-lime canister which, in turn, is connected to the endotracheal tube, is simple, safe, and efficient.

In so far as agents are concerned, one must keep in mind that, where mixtures of agents are used, the metabolic disturbances are always particular to the most toxic; so that when chloroform or ether has been used to fortify nitrous oxid, ethylene, or cyclopropane, one must think of toxicity in terms of the former group rather than the latter.

❊

G. D. Delprat, M.D. (384 Post Street, San Francisco). Doctor Lawrence has presented very clearly the technical considerations of anesthesia on the open thorax. As is evident in his paper a clear conception of the underlying physiology on the part of the anesthetist is an absolutely necessary and fundamental prerequisite. Then follows the need of his ability to recognize the symptoms of disturbed physiology, and his prompt correction of gas concentrations and pressures. No anesthetist without this fundamental background should permit himself to undertake any chest operation anesthesia; for even should an operation be planned that does not contemplate opening the pleura, yet this possibility is ever present. Under certain circumstances, for instance, a simple rib resection for empyema in a sick individual may be very shocking if the thoracic pressure relationships are abruptly disturbed. The technical points of this subject are ably presented. No discussion of the paper, however, would be complete without reference to the art of anesthesia which all surgeons will admit is nowhere so well demonstrated as by the competent "chest anesthetist."

There is unquestionably no comfort so great to the surgeon as the knowledge that the man behind the anesthetist's screen is alert, competent and reliable. The feeling that it is not necessary to glance over the drapes at that visible portion of the patient's face, and that it is not necessary to give directions to an already harassed anesthetist, is worth untold riches. To be able to ask, "How is the patient?" and to know that the reply, "He is all right," or "He will be all right in a minute," means what it says, is as great a comfort as the reverse is a torment. While Doctor Lawrence would be the last person to admit it, I will say that he gives just such an anesthetic!



THE LURE OF MEDICAL HISTORY†

THOMAS WATERMAN HUNTINGTON
A. B., M. D., LL. D.
V*

By Wallace I. Terry, M.D.
San Francisco

Doctor Huntington was born on January 16, 1849, at Rockford, Illinois, but sprang from New England stock. He was a descendant of Samuel Huntington, a prominent clergyman of Massachusetts and a signer of the Declaration of Independence. His father, Charles, was also a clergyman and an educator, and it was at his hands that the subject of our sketch received his early education. Doctor Huntington was graduated in 1871 from the University of Vermont, which institution, in 1913, also conferred on him the degree of LL.D.

As his finances were low after leaving college, he taught school and later entered Harvard Medical School, where he received his M.D. degree in 1876. At Harvard and at the Massachusetts General Hospital, where he interned, he came under the influence of such teachers as Oliver Wendell Holmes in anatomy, Porter, Warren, Homans, Bigelow, and Cheever in surgery, Fitz in pathology, and others prominent in the profession.

THOMAS W. HUNTINGTON
1849–1929

He began to practice in Nevada while it was still a frontier region, and there became a surgeon for the Central Pacific Railroad. His work in the latter capacity led to his appointment, in 1882, as assistant chief surgeon of the company hospital in Sacramento, the first hospital in the world devoted exclusively to railway employees. In 1885, he was made chief surgeon, and held that post for thirteen years, when he came to San Francisco and succeeded Robert A. MacLean as professor of clinical surgery in the University of California Medical School.

From 1882 to 1919, Doctor Huntington was quite a steady contributor to surgical literature. His papers dealt with a wide variety of topics, such as antisepsis and asepsis, surgery of the extremities, intestinal obstruction, gunshot and stab wounds of the abdomen, and pyloric stricture, for which he did Loreta's operation in 1889. He also wrote about aneurysm, appendicitis, hernia, nephrolithotomy, amputations, fractures, splenic cysts, stomach and gall-bladder surgery, and x-ray burns.

Some of his papers are important from a historical, as well as factual standpoint. As early as 1882, for example, he read a paper on "Antiseptics, as Applied to Surgical Art," from which I quote: "Without personal experience or experiment, with no ocular proof or demonstration, I have become a convert to the theory which has lent inspiration to surgery, and has ushered in a brighter era for sufferer and attendant alike." Two years later he

†A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of California and Western Medicine. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

* One of the papers given in Toland Hall, University of California Medical School, San Francisco, in the series on the history of the institution, arranged by the Division of the History of Medicine.

This is Paper V of the series. For other articles in the symposium, see California and Western Medicine, November, 1937, page 321; December, page 405; January, page 27; February, page 114.

reported over one hundred cases treated antiseptically, and said: "Under the old régime, we dressed all wounds once and the more important ones twice or three times daily. The dressings were many times stiffened and glued firmly to the skin by inspissated pus; lint fiber became incorporated in granulating surfaces, and large poultices weighed heavily upon throbbing sensitive areas. Each and all were torn from their moorings with a refinement of torture that would have delighted the demons of an inquisition. How different now! Where once in a given case we witnessed from fifteen to thirty repetitions of the foregoing scenes in a fortnight, we now renew our dressings once or twice."

I am confident that in 1882 very few surgeons in the West made any serious efforts to acquire an antiseptic or aseptic technique—in fact, Listerism had few adherents, many opponents, and many who knew nothing of the matter or were supinely indifferent.

On August 20, 1891, Doctor Huntington did the first successful appendectomy in the Far West. He had carefully observed the man several times during attacks, which he diagnosed as acute appendicitis, and waited for an interval period before operating. This case did much to enhance his reputation as a surgeon of diagnostic and technical ability.

In operations for hernia he also showed his progressiveness; for in 1891 he reported five operations by the Macewen method for the radical cure of hernia. In 1895, he detailed four operations on the gall-bladder.

He kept constantly abreast of the newer advances in surgery through the literature, and by faithful attendance at and participation in medical meetings, and by frequent trips to the medical centers of this country. His association with James H. Parkinson, a former president of the California Medical Association, and others, on the editorial board of the Sacramento (later the Occidental) *Medical Times,* gave him the opportunity to abstract surgical literature. Most of his earlier original contributions are to be found in those journals.

He was president of the Sacramento Society for Medical Improvement in 1891. As chairman of the Section on Surgery of the American Medical Association in 1912, he devoted his address to "The Hospital Problem," and made a plea for the inauguration of a "system of organized inspection and classification of all American civil hospitals"—a suggestion, however, which was not acted upon for many years. Also, in 1912, he was president of the California Medical Association.

In 1917, at the age of sixty-eight, he was a member of the American Red Cross Commission to Italy, and spent some time near the battlefields of Europe to report on hospital and other conditions.

Another high honor accorded him was election, in 1918, to the presidency of the American Surgical Association, when he discussed industrial medicine and health insurance.

He regarded his civic duties seriously. He served on the Board of Education in Sacramento; on the San Francisco Board of Health, shortly after the big fire when there were many problems to be solved; and on the directors' board of the Veterans' Home at Yountville.

He came to the University of California Medical School well equippel to teach and with a wealth of experience. He was a fluent speaker, a graceful, clever and conscientious operator, and was recognized as a master surgeon. He did much toward the establishment of the University Hospital. He retired as professor emeritus in 1912, after fourteen years of active teaching, but his vigor and clear intellect were changed but little in the intervening years until his death on April 19, 1929, at the ripe age of eighty.

CLINICAL NOTES AND CASE REPORTS

THYROIDISM*

By JOHN W. SHUMAN, M.D.
Los Angeles

THYROIDISM is like a two-story house with a cellar and attic.

The first floor resembles the normal thyroid state—the average individual. This type receives little notice from a thyroid, or from any other standpoint. As long as one remains on this floor all is well.

HYPOTHYROIDISM

However, as we descend into the cellar of *hypothyroidism,* too little thyroid activity is expressed. Fatigability and slow metabolism are encountered, accompanied by slow thinking, slow ideas, slow, nervous impulses, and slow everything. This is carried even to the floor of the cellar where, with its thick mind, thick skin, and coarse, brittle hair, *myxedema* vegetates.

This state of marked thyroid inactivity is acquired as a result of disease, or often as a result of injudicious surgery.

They are baffling in that they present certain symptoms that are analogous to the neurasthenics' complaints, but there is this difference: that while the neurasthenic excuses himself for not doing things, because of the complaints, and more or less hides behind them, the hypothyroid individual is annoyed at the handicap that these things he speaks of impose upon him, and tries to get ahead, regardless, with the resultant unavoidable fatigue.

We must not expect mental lethargy and sluggishness in all hypothyroids. Much depends upon the age at which the thyroid state appears. If it occurs after the individual's characteristics and mental pattern are set, then mentality is not altered. If hypothyroidism occurs early in life, then mental development is retarded, as well as physical vigor.

A further note of warning: One cannot always rely on the first basal metabolic rate reading as truly indicative of the patient's metabolism. In many hypothyroids there is a general neuromuscu-

* Presented to the Los Angeles County Hospital postgraduate course, November 22, 1935.

lar tension, which causes the first determination to be higher than a true basal rate.

A recent experience with a patient who presented all symptoms of the hypothyroid state, but was exceedingly nervous over a family conflict, found the first basal metabolic rate plus five. However, after the administration of two grains of desiccated thyroid gland daily for a week, we found the second reading minus twenty! There is, too, this difference between the neuropath and hypothyroid: the neuropaths make excuses because of their inability; the hypothyroid man goes until he breaks.

The clear-cut picture of disturbed thyroid states are not so difficult. The borderliners and mixed types are difficult, and these latter far outnumber the former. They blend into each other and often overlap, with no clear line of demarcation. The cretes, the extreme myxedemas, and the strongly hyperthyroids are easily recognized. The others we must study very carefully.

HYPOTHYROIDISM

As one ascends the steps from the first to the second floor, we find action. Hyperthyroidism begins to show with restlessness, nervousness, fast metabolism, fast mind, and fast everything. Most of us would rather be the second-story type than "sub," or just normal all of the time. This mild or intermittent "hyper" is the type which drives the world—and wears out in so doing—believing, no doubt, that it is much better to wear out than to rust out! The hyper type of mankind has made history; for example: Moses, who, in impulsiveness, slew an Egyptian taskmaster; David, who in his warmth for a woman had a husband killed so that he could take her to wife and produce Solomon; Peter, who, on account of his rashness, repentiveness and faithfulness, became "The Rock upon whom Christ built His church." Constantine, Frederick, Caesar, and Kaiser Wilhelm were not hypos. Neither are Mussolini. Roosevelt, and our own Los Angeles Aimee.

SUPERHYPERTHYROIDISM

As we ascend higher up toward and into the attic of this house of thyroidism, dire trouble is met and real suffering is found because in this attic dwells a too fast metabolism, which beats the heart to death, and produces active psychoses with coma and collapse: it is up there that we recognize an aggravation of the same symptoms which made some men famous. The *three "t's"* of *toxic thyroidism* are *tumor, tremor,* and *tachycardia.* These asthenic psychoses are the diametrical opposite of the asthenic psychoses of myxedema.

Thyroid enlargement (goiter) has held the stage for years. Folks will still continue to think goiter whenever thyroid trouble is mentioned. There are two times in the human's life when the thyroid enlarges, namely, puberty, and the climacteric (stress periods for both sexes). The female experiences two other times—menstruation, and pregnancy.

Eighty per cent of parturients have physiologic enlargement of their thyroid glands. In these, complications of pregnancy are rare. They are not only good nursers, but they make excellent mothers.

Many surgeons point with undue pride to the neat little white line of their thyroidectomy scars.

BIMANUAL PALPATION OF THE THYROID

Feeling the thyroid gland by means of the old choking method, from in front, is not satisfactory. The method which employs both hands of the examiner is better. The choking method, that is, with one hand of the physician encircling a part of the patient's neck from in front, always produces a muscular defense.

With the bimanual method, the examiner stands behind the patient, the thumbs being placed on the back or sides of the slightly flexed neck, when, with the index and second fingers, the lobes of the thyroid can be located, and their anterior and lateral surfaces explored. The patient aids by swallowing, which causes the gland to slide up and down under the examiner's fingers. This simple procedure has found many a nodule which had escaped the other method.

INDIVIDUALITIES

When studying patients in regard to thyroidism, we must consider that triad which is always working and is never the same:

- THE TRIAD
 - 1. Patient
 - 2. Disease
 - 3. Doctor
- (1) Patient
 - Heredity — We are what our ancescestors and parents made us. Characteristics are born, not acquired.
 - Environment — Gives us our tastes and acquisitions.
 - Stimuli
 - Are intrinsic—chemical and infective, or
 - Extrinsic—fixed and adjustable.
- (2) Disease
 - Hyper
 - Latently toxic
 - Mildly toxic
 - Severely toxic
 - Hypo
 - Passively sub
 - Moderately sub
 - Severely sub

Take care of the simple goiter today, because it may become the toxic one of tomorrow.

- (3) Doctor
 - Surgeon—"Operate"
 - Internist—"Medicate"
 - General Practitioner—"Procrastinate"

Stimuli depends upon type, age, sex, and so forth. If they are "fixed," it is just too bad for all parties concerned. Nevertheless, we must consider them all adjustable, and try to adjust them.

We have failed frequently in securing a permanent arrest of toxic thyroidism or even in temporarily breaking the chain of events by removing five-eighths of the thyroid gland, the reason being that we did not remove the psychic stimulus at the same time, for example, a chronic worry. This

worriment excited the remaining thyroid tissue to hypertrophy and to yield sufficient thyroxin to produce a recurrent *thyrotoxicosis.*

Infections produce acute thyroiditis, which in convalescence produces hypothyroidism. Focal infections (sinus, tooth, and tonsil) are common causes for malthyroidism. Irritation from impacted teeth, especially third molars, is too frequently neglected.

Once malthyroidism, always malthyroidism, demanding the continued services of the clinician.

3780 Wilshire Boulevard.

LYCOPODIUM GRANULOMA, AN AVOIDABLE SURGICAL COMPLICATION*

By John W. Cline, M.D.
San Francisco

FOR many years, dusting powders containing lycopodium spores have been used for various medical and pharmaceutical purposes. They are still employed in many hospitals in the preparation of dry sterile gloves and the dusting of hands of the operating staff prior to drawing on the gloves. The physical properties of lycopodium spores make such powders superior to talcum for this purpose.

COMPOSITION OF DUSTING POWDERS

These powders consist largely, or entirely, of the spores of L. clavatum, a species of club moss belonging to the fern family. The spores are about 30 microns in diameter, are roughly spherical in shape, and are covered by spinous projections. The spines cause the spores to adhere to tissues and quickly embed themselves. They make a fine, smooth, light powder, which has been called vegetable sulphur because of its pale yellow color. Due to high oil content, the spores are not wet by water and float upon it. For the same reason they burn with a quick flash when ignited.

ACTION OF THE SPORES

The spores have the property of creating an intense foreign body reaction when embedded in tissues, and have been used for the production of granulomata in experimental animals.[1] Their capacity to produce similar lesions in humans seems to have been completely overlooked until mention was made of it by Roth[2] in 1921. More recently, excellent papers have been published by Antopol[3] and Erb.[4] The reader is referred to these publications for more detailed pathological descriptions, illustrated by excellent photomicrographs.

GROSS APPEARANCE OF "LYCOPODIUM GRANULOMA"

The term "lycopodium granuloma" was introduced by Antopol to indicate the lesion produced by lycopodium spores when present in human tissues.

The gross appearance of this condition varies according to the location of the lesion and the presence or absence of secondary infection. In the peritoneal cavity, there is marked resemblance to tuberculosis. Elsewhere there is a tendency to nodular form, but the chief characteristic is the laying down of dense fibrous tissue with the usual firmness of chronic granulomata. Discharging sinuses are frequent. On section, the pearly white fibrous tissue, with islands of cellular tissue and necrosis, is seen.

MICROSCOPIC APPEARANCE

Microscopically, the process is essentially granulomatous, consisting of granulation tissue with fibrosis and necrosis. There is a marked tendency to tubercle formation, with epithelioid cells and giant cells of both the foreign body and Langhans type. The lycopodium spores are seen in the granulation tissue or giant cells as yellowish, refractile bodies staining poorly with ordinary tissue stains. In cross section, they show a membrane, surmounted by spines, surrounding a granular center. Frequently the collapsed membrane without a center is all that remains. When the tissue is stained by the Ziehl-Neelsen method, the spores stand out as acid-fast bodies.

Macroscopically and microscopically the lesions bear a close resemblance to tuberculosis. Erb suggests that the somewhat similar composition of the spores and the waxy capsule of the tubercle bacillus may be responsible for this. The spores contain "nearly 50 per cent of fatty oil."[5] It is this fat content which gives the spores their acid-fast characteristic. Erb very reasonably argues that this chemical composition influences the type of tissue reaction. He uses as an analogy the recent demonstration by Gardner and Cummings that the type of tissue response to silica particles is chemical rather than physical.

LITERATURE

The potential importance of lycopodium spores deposited in the tissues at operation can best be estimated by a review of the published cases. Erb and Antopol have each reported six cases. In this combined series of twelve cases, there have been three instances of intestinal obstruction due to very dense adhesions which the authors believe traceable to the lycopodium spores present. In one case an obstructing prostatic bar of lycopodium granuloma followed an operation for bladder stone. In another instance a draining sinus and granulomatous thickening, following an operation for traumatic hydrocele, led to an erroneous diagnosis of tuberculosis and subsequent orchidectomy. In one case nodules, appearing in the skin after removal of a benign tumor of the breast, led to a clinical diagnosis of carcinoma. Persistent draining sinuses have not been uncommon.

Lycopodium granuloma may be of little or great importance in a given case, depending upon the

5 The Dispensatory of the United States 1926, twenty-first edition, p. 666.

situation and extent of the lesion. However, it is usually troublesome and may be dangerous. Since it can be easily avoided, steps should be taken to prevent its occurrence.

The etiology of lycopodium granuloma is obvious. All of the reported cases show symptoms which have persisted since previous operation. The spores have been identified in the tissues of these cases, and in most of them the use of lycopodium preparation of the gloves used in the operations has been established. (The one exception to this was a case of squamous cell carcinoma of the arm, reported by de Messer in 1901.[6] This patient presented an open lesion through which the spores were introduced by use as a dusting powder.)

REPORT OF CASE

A white farmer, aged fifty-six years, came under observation because of draining sinuses which had persisted for four months following the repair of a right, indirect inguinal hernia. Immediately after operation the wound gave evidence of primary healing, but began to discharge about the tenth postoperative day and continued to do so thereafter.

The wound was healed except for two small sinuses in the lower portion. These ran inward for about one inch and converged near the pubic spine. Surrounding the wound, and extending as far as the midline, was an area of induration. This involved the abdominal wall and the anterior portion of the abdominal cavity. It could not be felt by rectum.

The remainder of the physical examination was not remarkable. The pus from the sinuses showed staphylococci and cultured the Staphylococcus aureus. The patient was submitted to operation.

Operative Findings.—Very firm inflammatory mass involving the incision of hernioplasty, extending from Poupart's ligament to the midline and upward from the symphysis pubis for a distance of about three inches. In the lower portion of the scar were two small sinuses, the lowermost of which ran perpendicularly downward and the upper obliquely to the same point. The subcutaneous scar was wide and so dense that it was difficult to recognize the aponeurosis of the external oblique. The sinuses met at about the level of the external oblique fascia, where they were joined by a third sinus, which paralleled the full length of the incision but had no superficial opening. The common sinus then turned medial to the spermatic cord, which was buried beneath the fused aponeurosis of the external oblique and the conjoined tendon. It penetrated these layers and dropped into a localized abscess in the lower anterior portion of the abdominal cavity. This abscess contained thick pus in the amount of one or two ounces. The cavity was searched for a foreign body, but none was found. The pus was smeared and examined at the time of operation. This examination showed staphylococci and no evidence of fungus infection. Sections were sent for microscopic examination and culture. Culture of the pus gave a pure growth of Staphylococcus aureus.

Pathological Findings.—The sections of tissue removed showed typical lycopodium granuloma with areas of granulation tissue, dense scar, and necrosis. There was tubercle formation with many giant cells. Lycopodium spores were seen embedded in the granulation tissue and in the giant cells. With the Ziehl-Neelsen preparation, they proved to be acid-fast.

Subsequent communication with the surgeon who performed the operation for inguinal hernia gave the information that the gloves used at the time of operation had been prepared with lycopodium powder.

[6] de Messer, A. F.: Virchows Arch. f. Path. Anat. 163:111, 1901.

SUMMARY

1. The literature dealing with lycopodium granuloma is reviewed briefly.

2. The etiology and importance of lycopodium granuloma are discussed.

3. A case of lycopodium granuloma is presented.

CONCLUSION

The use of dusting powders containing lycopodium spores is hazardous, and should be discontinued.

PSYLLIUM SEEDS: INTESTINAL OBSTRUCTION

By Robbin E. Fisher, M.D.
Pomona

THE dangers inherent in the ingestion of some of the so-called bulk-producing foods or drugs are well illustrated by the following case:

REPORT OF CASE

Mrs. P. S., age seventy-four, was first seen the evening of May 24. Her complaints were cramp-like, abdominal pain, vomiting, and obstipation. Significant facts in the history were that her bowels had not moved for three days, that she had been taking one teaspoonful of whole psyllium seeds daily for the past month, and that she habitually ingested very little water or other fluids. Physical examination revealed a small, poorly nourished, elderly woman with a very thin-walled abdomen—quite markedly distended. A diagnosis of intestinal obstruction was made and the patient transferred to the hospital. Two enemas given were expelled with a moderate amount of constipated stool, and a small amount of gas without relief of symptoms. A flat x-ray plate showed a "stair-step" pattern of small intestines, and no distention or evidence of impaction of the colon. Laparotomy on May 25 disclosed a very much distended ileum, with an impaction producing almost complete obstruction, about ten inches proximal to the cecum. There were no pathological constrictions or adhesions of the ileum at its point of obstruction. The impaction had the characteristic feel of psyllium seeds. It was easily broken up and milked into the cecum. The abdomen was closed. The patient made an uneventful convalescence.

COMMENT

This case, as well as observations made at autopsies, lead me to believe that psyllium seed and similar bulk producers are dangerous substances, especially in elderly people, from the standpoint of intestinal obstruction or fecal impaction of the colon. Their widespread use should be discouraged by the profession.

338 Investment Building.

If the foes of human health are ever to be brought under subjection, health service must be put on a basis of organized preparedness, not only in state but also in local governments, with suitably trained forces in adequate numbers in every country or district of 25,000 population or over. Moreover, the public health forces must cease to be defensive only. They must take the offensive against the age-old entrenchments of disease and subnormal physical standards. A modern health service worthy of its name is militant, dynamic and constructive, rather than static. It is such a program that the Public Health Service has for many years been seeking to promote among the states and which has received a tremendous impetus through Title VI of the Social Security Act."—The Health Officer.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

TETANUS

SYMPTOMS AND DIAGNOSIS

Albert G. Bower, M.D. (6777 Hollywood Boulevard, Hollywood).—There appear to be two methods by which the toxins elaborated by Clostridium tetani are absorbed from their focal source to produce the symptoms characteristic of tetanus. In one instance, the toxins travel from the focus, where they are formed, directly to the central nervous system via the lymphatics of the nerve sheaths. In the other instance, observed especially in cases with short incubation periods, the toxins appear to be distributed to the muscles of the body through the blood stream, and then absorbed through the endplates of the motor nerves to travel up their lymphatics and reach the motor ganglia and central nervous system. There is both experimental and clinical evidence for each viewpoint. Once tetanus is definitely established, besides the original primary focus, there exists a true toxemia in addition to the effect on the central nervous system produced by the fixation of the tetanus toxins within the nerve cells for which they show a selective affinity.

Usually the incubation period is within eight to ten days. In massive infections with much necrotic tissue at the focal site, it may be shorter. In many instances it may be much longer, the bacilli apparently remaining latent in the tissues until subsequently activated by chemical or mechanical irritation.

The first symptoms are commonly a stiffness of the neck, the jaw muscles, the esophageal muscles, the abdomen, or one or more limbs.

This stiffness increases until sensory stimulation produces a tetanic spasm. Finally spasm becomes constant, the jaws are locked (trismus), and cannot be opened, the corners of the mouth being drawn out to present a fixed sardonic grin (risus sardonicus), the eyebrows are elevated and the forehead wrinkled. The voice is often changed. The eyes remain partially closed, and the head becomes retracted. Gradually the other muscles of the body become increasingly spastic, and opisthotonus or orthotonus may set in on sensory stimulation, producing frightful tonic convulsions accompanied by almost unbearable pain. Occasionally the body is bent to the side (pleurothotonus), and rarely even forward (emprosthotonus). These convulsions are reflex and may be set in motion by most trivial stimuli, *e. g.,* a ray of light striking the eye, a breeze from a fan, movement of the bed clothes, etc. The penis is affected along with the back muscles. In a well-defined case, complete relaxation between convulsions is lacking, the muscles remaining spastic to a lesser degree only, and voluntary movements are impossible of accomplishment. The muscles remain stiff when anesthesia is induced. Difficulty in swallowing and breathing are common, the latter being accompanied with cyanosis. Convulsions last from a few seconds to several minutes. Fever is not high as a rule, but may reach an agonal height of 113 degrees Fahrenheit. Profuse perspiration is commonly present. Death is usually from asphyxia or from exhaustion. It is practically never of cardiac origin.

It must be remembered, in connection with this discussion, that while typical tetanus is easy to diagnose from the above symptoms, mild or atypical tetanus exists, and may be very difficult to detect. Many cases of the disease start as localized tetanus, with pain or stiffness first detected around the atrium of infection, or limited to one limb. This may persist for a long time before trismus appears, and tetanus without trismus, its cardinal symptom, has been described. Such cases may recover spontaneously, the incubation period being very prolonged, the toxicity extremely low, and symptoms limited to a mild, general spasticity of the muscles, and a questionable trismus. We have seen such a case. About 10 per cent of all cases of generalized tetanus start as a premonitory localized type.

Considering the seriousness and fulminating course of the average case, it is surprising to note that, in a relatively large number of cases, the atrium of infection remains completely undisclosed.

Tetanus neonatorum usually occurs five to eight days after birth, most generally occurring from infection of the umbilical stump, but occasionally from circumcision. It is commonest in dairying communities, and is not unknown in California.

Diagnosis.—Given a typical case, the diagnosis is relatively easy. If trismus be present in characteristic fashion, the burden of proof rests upon any clinician, who diagnoses the case anything but tetanus. This does not imply that conditions simulating trismus do not exist.

Early diagnosis is of utmost importance from the standpoint of prognosis and treatment, for the earlier the treatment is started the greater is the probability of a successful outcome. Localized tetanus is apt to be overlooked, unless its occurrence is kept in mind and a history of the preliminary wound is obtainable. During the World War, nurses were required to invite the attention of medical officers to all cases in which tissues surrounding a wound were more rigid than around wounds in other areas on opposite sides. Experience taught that these cases usually developed generalized clinical tetanus, if adequate débridement and encircling infiltration with antitoxin were not promptly carried out.

The differential must be made between strychnin poisoning, tetany, rabies, meningitis, hysteria, and occasionally poliomyelitis, infectious myelitis, and sometimes the rarer nervous disorders.

Local conditions of the parotids and in the throat may also simulate trismus at times, but lack of the other signs of tetanus make these easily differentiated.

A careful history (when obtainable), a careful physical examination, a check of the deep and superficial reflexes, and the examination of the spinal fluid, when indicated, will serve to differentiate all of the above from tetanus relatively easily. In most of them trismus remains absent.

In strychnin poisoning, symptoms start immediately after assimilation of the drug in toxic doses. Complete relaxation usually occurs between the convulsions, and trismus is not a prominent symptom. Certain tonic pills used by the Mexicans, and surreptitiously swallowed by children for their sugar coating, cause this condition; and the same is true of the ordinary Hinkle pill.

In rabies the history of an animal bite, and the fear of water, with the lack of trismus, suffices. Do not forget that tetanus may follow a dog bite.

In tetany our patients are usually small children. The spasm is accompanied by a characteristic cry, and it is usually limited to the muscles of the larynx and extremities. There is no true opithotonus, or real trismus. Fever is low or absent, and stimulation of certain parts of the body does not produce convulsions.

In the other diseases of the central nervous system, the lack of trismus, the changes in the deep and superficial reflexes, the changes in the spinal fluid, and the variable and different response to different stimuli, should suffice to differentiate them.

* * *

PROPHYLAXIS

Elbridge J. Best, M.D. (384 Post Street, San Francisco).—The first step in planning the prophylaxis of a disease is to become familiar with its incidence and distribution. A survey of a recent yearly mortality report from the United States Census Bureau shows about one death from tetanus in 1,071 for the whole country. The highest rate is in cities of 2,500 to 10,000 population, and the lowest is in the rural areas. In dividing the nation into districts, the southern states show the highest incidence, with Florida averaging one in 312. Of interest is Kentucky with a rate of one in 839, much lower than the neighboring states. The midwestern states average about that of the nation as a whole. The coastal states have a lower rate. The State of Washington averages one in 8,000. Most of the states show the highest rate for tetanus in cities of 10,000 and over, the other states show the highest rate in cities of 2,500 to 10,000. In all the states the lowest rate was in the rural districts. California averages lower than the nation, and the large cities record most of the tetanus deaths.

The tetanus bacillus is found widespread in well-cultivated soils and in the intestinal tract of domestic animals. The incidence would supposedly be higher among farmers, gardeners, and stable workers; yet it is in the more congested centers of population that most infections are reported. To such areas prophylaxis should be more intensely applied.

One prophylactic effort has borne fruit, namely, the outlawing of firecrackers on the Fourth of July. The American Medical Association reports show the obvious results in the recent, almost no-tetanus mortality with the modern, sane Fourth.

Tetanus develops in punctured wounds and rarely in open wounds; therefore, theoretically, prophylaxis should be practiced immediately upon the receipt of each and every puncture wound. If every tetanus contaminated wound were débrided, cleaned, and oxygenated, nearly all patients would be saved.

For many years tetanus antitoxin has been administered by physicians and emergency hospitals more or less routinely when there was a suspicion a fresh wound was or might be infected by the bacillus of tetanus. Perusal of the United States Army medical records shows that the prophylactic use of tetanus antitoxin was practically universal in the American Expeditionary Forces. The soil of northern France is notoriously rich in tetanus possibility. With the use of serum, the incidence of tetanus infection was strikingly low. This result answered any doubt of the value of antitoxin as a prophylactic measure for tetanus.

The universal use of serum with every accidental wound raises a few serious questions. First, the cost of the serum would greatly raise the financial burden of treatment of wounds. Second, there is the serious problem of shock and death from serum reaction. Universal use of serum might result in serum deaths to an amount as formidable as the tetanus deaths it was supposed to prevent!

Descomby, in 1924, found it was possible to detoxify tetanus toxin, as Ramon had detoxified diphtheria toxin. Zoëller and Ramon had, in 1926, found a certain amount of tetanus antitoxin in the blood, after three doses of tetanus toxoid. This amount was not sufficient to protect an animal from infection, but if a fourth dose were given at the time of injury, protection was sufficient. Toxoid given in short intervals does not furnish as high blood antitoxin as two doses with long intervals (Bergey). In 1933, Ramon and Zoeller showed that, if two doses of toxoid are given thirty days apart and a third dose used at the time of injury, the blood antitoxin is higher than 1,500 units of antitoxin. Sneath and Kerslak, in 1935, showed no loss of antitoxin in the blood two years after active immunization with toxoid.

Ramon and Lematayer studied the presence of natural tetanus antitoxin in the blood of animals and man. In some animals they found antitoxin present, but there was no natural immunity in human serum.

Mixed vaccines have been studied since 1887. In 1926, Ramon and Zoeller found the antitoxin titer definitely augmented when tetanus toxoid was given in combination with diphtheria toxoid.

* Editor's note: This discussion was received May 20, 1937.

When one cubic centimeter of plain tetanus toxoid, improved, is injected subcutaneously, immunity slowly rises in the individual up to from ninety to one hundred and fifty days.

In recent years the French army has been used for prophylactic studies. Along with typhoid vaccine it is now obligatory that every soldier be immunized for tetanus. The present procedure is to give two cubic centimeters each of tetanus toxoid and diphtheria toxoid fifteen days apart. One year later one injection of two cubic centimeters each is given.

When tetanus antitoxin is given at the first treatment following an injury, immunity is present possibly for six weeks; but such immunity is not to be relied upon for more than two weeks.

It is of interest to note that a few nationally known biological houses offer tetanus toxoid, and one house has the combination of diphtheria toxoid and tetanus toxoid.

From the above résumé an up-to-date procedure can be set forth that, if carried out, will greatly lessen the present morbidity and mortality of tetanus infection.

Prophylaxis should be directed intensively toward those areas giving the higher incidence of the disease. Our census figures point, not to the agricultural areas, but rather to the centers of population, and those cities of 10,000 population and more need as much, if not more, protection than the cities of 2,500 to 10,000. A great work has been accomplished in these populated areas by the use of diphtheria toxoid. Therefore, it is proposed that the following procedure be carried out:

"For tetanus prophylaxis: All children be given one cubic centimeter of tetanus toxoid, with one cubic centimeter of diphtheria toxoid subcutaneously. Three months later a second injection is to be given. One year later, or upon receiving an injury, a third dose is to be given.

"As gardeners and soldiers are more exposed to tetanus infection than most other occupations, the same procedure should be carried out in these classes as is outlined for children.

"In cases of suspected wounds, when no previous immunity has been attempted, the following procedure should be carried out: Prompt débridement of the wound should be done. Oxygenation of the new open wound is then accomplished. Following this, an injection of 1,500 units of tetanus antitoxin (or tetanus-gas gangrene antitoxin) is given. At the same time tetanus-diphtheria toxoid is given (one cubic centimeter of each). Three months later a second toxoid injection is given. The third toxoid injection is to be given on receiving another injury."

* * *

TREATMENT

Hyman I. Vener, M.D. (Los Angeles City Health Department, 116 West Temple Street, Los Angeles).—The management of tetanus will be considered from the standpoint of: (1) the public health problem; (2) active prophylaxis; and (3) clinical treatment.

The Public Health Problem.—With the years, the problem of tetanus in California unfortunately has become a challenge to the medical profession. Between 1921-1935, there were one thousand cases, with a gross fatality of 75 per cent. The State Department of Public Health lists the incidence as follows: 1921-1925, there were 295 cases; 1926-1930, there were 347 cases; and for the period of 1931-1935 there were 358 cases. Los Angeles City and County contributed 414 cases, which is approximately 41 per cent of the entire series noted. During the same period the Los Angeles County Hospital treated 205 of these cases, with a gross fatality of 56.5 per cent.

Rapidity of development, the diversification of industry, agriculture and population, all may play rôles. Temperature and meteorological conditions in association with present unknown qualities of our soil may be contributory factors. In a previous study (Ref.: California and Western Medicine, 29: 6, December, 1933), approximately 53 per cent of the cases occurred under the age of ten years, the greatest incidence being between the ages of five and ten.

Have we chronic carriers, who only await the proper combination of circumstances to develop clinical manifestations? Do we possess antitoxic or immune properties to the disease, which are insufficient or lacking in the younger-age groups? Are there factors in methods of soil cultivation and agriculture which transmit subclinical infection over a period of years with resultant immunity? These and many more interesting speculations could be advanced, but these are problems for future research and consideration. One must not lose sight of the greater predominance of minor or trifling injuries in the age group of the population that is most likely to have the greatest number of these accidents. Furthermore, frequently such incidents occur under conditions and environment that are favorable for the multiplication of the organisms.

Under present circumstances, education presents the best method of approach to the problem. Parents should be advised of the consequences arising from apparently trifling and innocent injuries. The seriousness of the disease, once clinical manifestations have appeared, must be stressed. The methods of prevention must be emphasized.

The profession must also appreciate the foregoing facts, and particularly stress the point that the apparent innocence of an injury affords no criterion that clinical tetanus will not develop. The fact is apparent that not every case of a trifling splinter or abrasion receives prophylactic antitoxin. Nevertheless, such incidents may cause tetanus, and no one can forecast the ultimate result. The question is repeatedly asked, "Doctor, shall I give my child antitoxin every time he gets a splinter or scratches himself?" The answer is difficult to state. One may only present the possibilities and allow the final decision to rest with the patient or the parents.

Occasionally, the administration of 1,500 units of prophylactic antitoxin is inadequate, resulting

in a false sense of security. It may be possible that, in the future, previous immunization with tetanus toxoid may offer a solution. If the disease continues to increase, serious consideration may have to be given to such a program.

The coöperation between the official health organizations and the profession, as to this disease, has become a necessity. Our responsibility cannot be evaded as to the gravity of the situation.

Active Prophylaxis.—The tract of all puncture wounds should be incised, enlarged, properly cleansed, drained, and treated with hot compresses. Each wound must be treated as a potential infection. Every effort must be made to remove all foreign material. In deep abrasive wounds a thorough débridement should be performed. Prophylactic antitoxin should be given concurrently with surgical management.

Cauterization of wounds is mentioned, only to be condemned. Caustics form an eschar which excludes oxygen, thereby creating a favorable medium for anaerobic organisms. In addition to lowering the oxygen tension, additional insult is inflicted upon tissues already devitalized.

In the average case, 1,500 units of antitoxin generally is sufficient, regardless of the patient's age. Prior to administration, every effort should be made to obtain a careful history of previous allergic reactions, such as asthma, hay fever, or serum inoculations. These precautions should be supplemented by skin testing. When a positive history or skin test is obtained, the attending physician must make the final decision. He must weigh a potential case from the type of injury present, against the possible reactions resulting from the use of antitoxin. In place of a single dose, clinical experience has shown that acute serum reactions are less apt to occur if antitoxin is given in divided doses over a period of forty-five to sixty minutes.

In extensive injuries, 1,500 units of antitoxin can be given at once and repeated in twenty-four hours. However, when two doses are contemplated, it is not amiss to give only one dose of 3,000 units.

It must be reiterated that 1,500 units of antitoxin do not afford invariable protection.

Active Management.—The following discussion is the result of many modifications in therapy. Ten years of management and supervision of tetanus in the Communicable Disease Unit of the Los Angeles County Hospital makes one aware of the world-wide problem confronting workers in this field.

In the past two years, using the procedures to be enumerated, a series of fifty-five consecutive cases have been treated. Excluding deaths occurring within twenty-four hours of hospitalization, and cases treated elsewhere before admittance to the institution, there have been forty-four cases, with a net fatality of 13.6 per cent. This rate is believed to be the lowest reported in medical literature, and this discussion will serve as a preliminary report. The fact that the number of cases is relatively small is appreciated, but the program is being continued.*

Every case of tetanus is a grave emergency, and no time may be lost in instituting treatment, regardless of how mild the case may appear.

Hypothetical Case.—To avoid confusion, and for the sake of brevity and conciseness, a hypothetical case will be chosen and its course followed during the first few days in the hospital. All the hours enumerated are arbitrary, unless otherwise definitely specified.

1. Patient admitted to diagnostic ward—8 a. m.

History obtained from patient or party accompanying him. Physical examination performed with minimum disturbance of the patient. Diagnosis is made. The focus of infection is determined and isolated. A skin test is performed.

2. Sedatives administered—8:30 a.m.

Ten to thirty grains of chloral hydrate are dissolved in one-half to one ounce of water, depending on the age and size of the patient. It is given by mouth, if patient can swallow, otherwise by rectum. Deep narcosis should be avoided, due to adverse changes that may result from the arrest of metabolism.

Subsequently, while the patient is in the hospital, chloral hydrate alone, or in combination with calcium bromid, 20 to 50 grains—depending on the age and size of the patient—may be given. The dose is repeated as needed, orally or by rectum. Mild seizures are not an indication for additional sedatives. It is only occasionally that the use of other commercial sedatives have to be added.

After the sedative is administered, an interval of one hour elapses before treatment of any kind is instituted.

3. Local treatment of the wound—9:45 a.m.

If necessary the focus is encircled with novocain, otherwise this procedure is omitted and 20,000 units of tetanus antitoxin is injected in an encircling manner about the lesion. After a waiting period of approximately forty-five minutes, or at 10:30 a. m., the lesion is incised widely, or excised thoroughly, whichever is applicable. All foreign material is eradicated, and the lesion treated with hot compresses, regardless of how innocent it may appear. Care should be taken to keep the incision within the area encircled by the antitoxin. It is possible that a temporary barrier against further progress of the tetanus toxin into the general circulation may be formed by such a procedure.

If an extremity be involved, as is frequently the case, 40,000 additional units is injected deep intramuscularly, at the junction of the upper and middle thirds in a manner to girdle the thigh. This procedure establishes an additional barrier to the spread of the toxin along the course of the nerve trunks.

4. Cisternal therapy—11 a. m.

If sedation is sufficient, no great difficulty is encountered with this procedure. Drainage of

*To September 1, sixty-two cases. Excluding eight deaths occurring within twenty-four hours of hospitalization, fifty-four cases with eight deaths, a net fatality case rate of 14.8 per cent.

spinal fluid is followed by reinjecting 20,000 units of antitoxin slowly by the gravity method. The serum must previously have been warmed in a lukewarm bath, to body temperature.

Following cisternal therapy, the patient's temperature may be elevated from 104 to 105 degrees Fahrenheit, but this gradually subsides in six to eight hours. During this period hourly rectal readings should be charted. When the temperature has receded to approximately 101 or 101.5 degrees Fahrenheit, intravenous antitoxin is administered.

5. Initial intravenous antitoxin administration—7 p. m.

Approximately six to eight hours after the cisternal procedure, the first intravenous dose of 40,000 units is given. This is diluted in 300 to 500 cubic centimeters of normal saline, regardless of age or size of the patient. About one hour should be allowed for the intravenous flow. The rate must be slow and by the gravity method. Five minims of adrenalin are given hypodermically at the beginning, midway, and at the completion of the antitoxin injection.

Precautions against anaphylactic shock should be observed. It is advisable to keep all serums used at room temperature for twenty-four hours before giving. Prior to immediate use these vials should be immersed in a lukewarm solution for fifteen to twenty minutes. Always warm the antitoxin before giving, regardless of the route employed.

6. Hexamethylenamin therapy—10 p. m.

This drug constitutes a very important and essential part in therapeutic management. Two hours following completion of the intravenous antitoxin (as noted in procedure 5) 15 grains of hexamethylenamin (10 cubic centimeters of a 10 per cent solution) are given intravenously.

7. Second intravenous antitoxin administration—11 p. m.

At the end of one hour, following the hexamethylenamin, an additional 40,000 units are given, provided there has been no reaction from the initial intravenous dose (procedure 5), and the rectal temperature remains below 102 degrees Fahrenheit. This is prepared as before, and all previously mentioned precautions are observed.

If a serum reaction has occurred, no further intravenous antitoxin is given. When an elevation in temperature is the sole reaction, additional intravenous antitoxin is withheld until it subsides, despite the appreciable increase in the time interval between doses.

8. Subsequent intramuscular antitoxin—7 a. m. or near the end of the first twenty-four hours of hospitalization.

Approximately eight hours after the second intravenous antitoxin injection (procedure 7), an additional 40,000 units is injected deep intramuscularly in an encircling manner. This injection should be proximal to the atrium, as already described.

If, however, for any reason, the second intravenous dose of antitoxin (procedure 7) is omitted, intramuscular injections are substituted as follows:

Eight to twelve hours following the initial intravenous dose of antitoxin (procedure 5), 40,000 units is given. This dose is repeated in eight to twelve hours. All intramuscular injections are given deep, and in an encircling manner, until an aggregate minimum of 200,000 units has been administered. No further antitoxin is given in most cases.

Hexamethylenamin, fifteen grains (ten cubic centimeters of a 10 per cent solution) is given intravenously ten to twelve hours after each intramuscular injection.

A summary of the dosage is as follows:

20,000 units infiltrated to enclose the lesion in its center.

40,000 units deep intramuscularly to circle the limb proximal to the focus.

20,000 units intracisternally.

40,000 units intravenously in normal saline, approximately eight hours following the cisternal.

15 grains of hexamethylenamin intravenously, two hours after the intravenous antitoxin.

40,000 units of antitoxin in normal saline intravenously, one hour after the administration of the hexamethylenamin, provided no previous reaction has occurred.

40,000 units of antitoxin deep intramuscularly to circle the limb proximal to the lesion, eight hours after the second intravenous antitoxin, and followed by:

15 grains of hexamethylenamin intravenously in ten to twelve hours.

Total dosage, 200,000 units of antitoxin regardless of size, age or sex of the patient, or the incubation period.

If any reaction occurs following the initial intravenous antitoxin, all further intravenous antitoxin is omitted. Instead, intramuscular injections of 40,000 units are substituted, until a total of 200,000 units has been administered. Each intramuscular injection is supplemented in ten to twelve hours by 15 grains of hexamethylenamin intravenously.

Desensitization Measures

After the minimum amount of antitoxin has been given, the progress of the patient is observed. During the first ten to twelve days the rigidity of the neck, the board-like tenseness of the abdomen, and trismus all remain. However, the general condition of the patient continues to show clinical improvement.

After once giving 200,000 units, additional large doses of antitoxin are not given unless the patient has a relapse. However, 1,500 units are given intramuscularly every three to four days for at least four doses in order to keep the patient desensitized in case more antitoxin be needed later.

Occasionally, when convalescing, orthopedic conditions arise which require surgical interference. If this be the case, it is advisable to continue at intervals the prophylactic injection of 1,500 units intramuscularly. This should be given every four or five days, until the end of the second week of surgical convalescence. Cases of relapse have been observed when such precautions were omitted.

Special Considerations

Fluids.—The patient should be allowed all the fluids he can take by mouth, if distress is not too great. If unable to swallow, 5 per cent dextrose, saline, or a combination of the two, may be given intravenously during the first few days. Caution must be exercised not to overload the patient with intravenous fluids. Massive doses are dangerous and may induce pulmonary edema, hypostatic pneumonia, and cardiac failure. After the first few days, with assistance, most patients manage to take small amounts of water by mouth.

Oral Hygiene.—Oral sepsis must be prevented, as far as possible, by gentle suction, aspiration, or cleansing. Careful attention to this detail will help avoid a fatal secondary aspiration pneumonia.

Diet.—The diet consists of liquid foods at frequent intervals, gradually changing to a semi-soft and soft diet by the end of the second week.

Posture.—Frequent change of position is essential to avoid pulmonary complications. Resting on the side or abdomen is preferable and desirable by most patients. A certain degree of restlessness or mild convulsions are of no great concern, and are no indication for additional sedation.

Sinuses. — Despite precautions, patients frequently develop purulent sinusitis. Excessive sedation and poor oral hygiene, associated with mouth breathing and rapid shallow respirations, contribute to a secondary bronchopneumonia.

To avoid such complications, postural drainage by moderate elevation of foot of the bed, and shrinkage of the mucous membrane of the nose, will aid materially.

Pneumonia.—This condition may complicate the clinical picture between the fifth and seventh days, and requires symptomatic treatment.

Serum Sickness and Urticaria.—This complication almost invariably occurs between the fifth and tenth days. Drugs used in the treatment are: ephedrin, aspirin, calcium bromid, and calamin lotion. Tincture of Apis, 10 to 60 minims, four times a day, is often of great aid. Occasionally, calcium gluconate is used intravenously. If the discomfort of the patient becomes too great, sedatives or narcotics may be necessary.

Quiet.—The patient should be in a semi-dark room where excessive light can be avoided. Special attention should be given to squeaky beds, doors, noisy elevators, unnecessary bedside conversation, and repairs being made in the hospital, in the vicinity of the patient's room. Such factors must be reduced to a minimum, for they serve as harmful stimuli.

Nursing Management.—Next to antitoxin therapy, general nursing care plays the most important rôle. The nurse should be entirely aware of the difficulties encountered and their management.

Frequent attention to oral prophylaxis, posture, changes of position and other factors enumerated, all contribute to recovery. The nurse should refrain from fussing too much with the patient.

Good judgment and an appreciation of practical management will often be the deciding factor in saving life.

In conclusion, the problems confronting the profession in the field of prevention and prophylaxis are stressed. An effort has been made to present the difficulties encountered, and the practical application of certain tried principles in management which, at this writing, have resulted in the lowest-known fatality in medical literature for such a series.

Simple Cysts of the Ovary.—Stabler selected ninety-three patients for his discussion because their symptoms seemed to relate directly to the ovary, both preoperatively and postoperatively. Follicular, luteum and retention cysts were generally the rule. All the patients had cystic ovaries that were diagnosed at the time of operation. Two symptoms were common to all cases: a boring type of pain in one or both sides and an increase of pain at menstruation, of a bearing down type. Fifty-five patients had pain in the back, fifty-three had pain down the leg, fifty-eight had regular menstruation, twenty-three had irregular menstruation and thirty-seven had to go to bed because of pain at the menstrual period. His treatment was the resection of the ovary, removing all cystic tissue if as much as one-sixth of the ovarian tissue could be left; removal of the entire ovary if the whole ovary was cystic; puncture of the cysts when only a few cysts were found. In all patients, when it was deemed advisable, who were more than thirty-six years of age, the entire ovary was removed if it were cystic, both ovaries if both ovaries were cystic. Postoperative results, which range from six years to four months, show freedom from pain in forty-seven cases, pain after operation that corresponded to the resected ovary in thirty-two cases, pain after operation that corresponded to the removed ovary in fifteen cases, and pain after operation believed to be due directly to the remaining ovarian tissue in twenty-three cases. The regularity of menstruation improved in thirty-three cases, menstruation was unimproved in seventeen cases, the menstrual cycle was shorter and the flow more moderate in sixty cases, forty-one patients were apparently improved and five were apparently unimproved. Recognition of, or the failure to recognize, the clinical importance of multiple follicular, luteum or retention cysts of the ovary may result in the success or failure of a major surgical procedure as far as the clinical results to the patient are concerned.—*Alabama Medical Association Journal.*

Malignant Tumors of Nasopharynx.—Needles presents a study of thirty-five cases of malignant tumors of the nasopharynx, sixteen of which manifested neurologic complications. Patients with disturbances of the auditory mechanism—whether tinnitus, deafness, pain or stuffiness in the region of the ear—should be subjected in a routine manner to a nasopharyngeal examination. Likewise, in the presence of enlargement of the cervical lymph nodes the possibility of a nasopharyngeal growth should be entertained as regularly as is tuberculous adenitis, the luekemias or Hodgkin's disease. For the neurologist, the presence of a basilar syndrome, especially with involvement of the cranial nerves coursing through the middle fossa, should immediately lead to the request for a nasopharyngeal examination. A basilar meningioma, a metastatic neoplasm, an inflammatory process or an aneurysm at the base of the brain can produce an identical neurologic picture; the differential diagnosis may therefore hinge on this simple diagnostic procedure. When, finally, in addition to the auditory symptoms there is enlargement of the cervical glands and involvement of the cranial nerves at the base of the brain, an irrevocable syndrome of nasopharyngeal malignant tumor is present. The results obtained from radiotherapy in cases of nasopharyngeal tumor are encouraging but as yet far from satisfactory. Earlier diagnosis and treatment may be the instrumental factor in correcting this defect. In cases which clinically present the picture of malignant tumor of the nasopharynx it is well to disregard a negative biopsy report and to proceed with appropriate radiotherapeutic measures.—*Journal of Nervous and Mental Disease.*

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section on pages 2, 4 and 6.

OFFICIAL BUSINESS

AMENDMENT TO CONSTITUTION—ELECTION OF COUNCILORS

In accordance with the rules of the House of Delegates, the following proposed amendment, introduced in Del Monte, to the Constitution is given its second publication and notice.

(*d*) Amendment to Constitution, Article VII, Section 1—Election of Councilors. Introduced by Dr. Loren R. Chandler of San Francisco.

(d) *Resolution Regarding Nomination and Election of District Councilors*

RESOLVED, That Section 1 of Article VII of the Constitution of this Association be and hereby is amended as follows, by striking out all the third paragraph of said Section 1 of Article VII, reading as follows:

"The nine district councilors shall be elected as follows: Prior to the time set for the election of district councilors the delegates of each councilor district for which a councilorship is about to become vacant, shall meet, organize, and in due form elect one or more members of the said councilor district as the nominee or nominees for the said vacancy. Such nomination or nominations shall be submitted in writing, signed by at least two delegates who were present at such meeting, and shall be given to the Secretary-Treasurer, by him to be transmitted to the House of Delegates. The House of Delegates may make additional nominations from the floor of the House, and in the event that the delegates from a councilor district fail to submit a nomination or nominations, shall on its own account proceed to make nominations for each district councilor vacancy. A vote shall then be taken by the House of Delegates to determine who shall be elected to the vacant councilorship"; and by inserting in lieu thereof the following:

The nine district councilors shall be elected as follows: At least one month prior to the time set for the election of district Councilors, the Secretary-Treasurer shall mail a written notice to each delegate, addressed to his address listed in the Association's records, of each councilor district for which a councilorship is about to become vacant, notifying the delegates of the time, which must be at least two weeks after the mailing of the notices, and a place designated by the Secretary-Treasurer, for the nomination meeting of the delegates of said councilor district.

PASSING COMMENT

Write to the Manager, Hotel Huntington, Pasadena, for your hotel reservations for our annual session, May 9 to 12. All reservations are made through the hotel management. The official program will appear in the April issue. Plan now to attend.

* * *

Barking dogs, singly or in small packs, cannot halt the progress of the caravan of medicine. Invariably these barking groups become lost in the quagmires of their nebulous theories relating to socio-economic experimentations, which are unwarranted and of scant or any merit.

* * *

Better check and see if you have a 1938 American Medical Association Fellowship card in your pocket or files. You will need it to gain admission to the meetings and exhibits of the American Medical Association session in San Francisco next June.

* * *

You undermine yourself, your future and your profession when you agree to render service at "cut rates" and below the accepted fees for your community. You are digging your own professional grave when you fall for the blarney of some claim agent or adjuster. Your private patients will desert you when you bill them at higher rates than those you accept from an insurance company. You may think they won't, but they certainly will find out and then they will not seek your services. Adhere to one standard—just, fair fees for all—private patients and insurance companies. Refuse to undercut fees.

* * *

Income tax, state and federal, payment time is at hand. Do not forget to file your returns. Remember also that you are entitled to allowance for expenses of medical organization dues, JOURNAL subscription, expenses while attending medical meetings, funds contributed to charity, depreciation on office equipment, library, and automobile. It pays to have a competent person compute your returns and conserve your interests. There is a penalty for neglect or delay in filing. Attend to it before the penalty date becomes effective.

* * *

With almost every malpractice suit falling into the class of "blackmail" or "hold-up" and without basic merit, the filing of a suit against a doctor is rarely a reflection upon his professional reputation. Therefore, the doctor need not be greatly concerned except for the annoyance and time required for defense in court.

In spite of these facts, a doctor sued becomes alarmed and is anxious that his insurance carrier make a cash settlement in place of defending him in court. This is an ill-advised attitude. Settlement will arouse suspicion in your community and the whisper will go about, "Dr. ——— must have been neglectful, for he made a cash settlement out of court."

In place of settlement, fight and carry the case through to a court verdict. Vindication by a verdict of "No cause for action" will be to your credit in your community. Just recently a case was defended in court where the amount requested for settlement was $6,000. When the jury rendered its verdict, "No cause for action," the doctor was vindicated; the patient and his attorney were out $6,000, to which they were not entitled.

Another case that went to trial after several weeks a verdict was brought in by the jury in favor of the plaintiff. Argument by counsel obtained a new trial. The plaintiff and attorney were unable to finance a new trial—consequently, the case was dismissed. It is reasonable to presume this attorney will be reluctant to accept future cases unless he has definite proof to substantiate a claim.

When attorneys perceive that suits are going to be fought and that their drafting of a declaration is not going to be followed by an offer of cash settlement out of court, the number of these suits will decrease. Hence the advice: while a suit is unwanted and unwelcome, should you be made a defendant do not assent to or seek settlement. Fight it through the courts to the very limit. Do not compromise yourself.

MEDICAL FUNCTIONS OF STATE BOARD OF PUBLIC HEALTH

From time to time inquiries are received as to what extent the Department of Public Health engages in the practice of medicine. In order that official activities might be accurately recorded, Doctor Dickie, State Director, was requested to supply this information. He kindly complied by sending the following statement:

PUBLIC HEALTH OF CALIFORNIA IN 1937

Walter M. Dickie, M.D.

Director, California State Department of Public Health

One of the most far-reaching activities in the promotion of public health established during 1937 is the reëstablishment of the Bureau of Venereal Diseases in the California State Department of Public Health. In 1917 the first state bureau of this sort was established in California. It operated until 1920, when lack of funds stopped its work.

The Bureau of Venereal Diseases, established by the 1937 legislature, has a biennial appropriation of $150,000, augmented by Social Security funds. The program in the control of the venereal diseases provides for case finding, treatment, support for public clinics, free distribution of drugs for patients who are unable to pay, education in prevention and other attributes that may be effective in the control of these diseases. New forms for reporting cases of syphilis have been devised and circular letters pertaining to reporting, treatment, and control have been sent at regular intervals to all licensed doctors of medicine in California.

The extensive migration of agricultural laborers into California from other states and from Mexico has made necessary the establishment of special activities to control communicable diseases among such laborers, and to provide essential protection to residents of California. These activities have covered general camp sanitation, immunization against smallpox and diphtheria, instruction in child hygiene, maternal welfare, and nutrition. In addition, special facilities for the diagnosis of tuberculosis have been provided. A motor truck, equipped with x-ray apparatus, is moved from camp to camp, and all reactors to the tuberculin test are given the x-ray examination.

Six pediatricians have been added to the staff of the Bureau of Child Hygiene and have been assigned to regular routes in the extreme rural districts of the State, where medical services are generally not available. Two trailers, equipped with dental apparatus, have been sent into the extreme rural districts, where three staff dentists provide temporary repairs for children whose parents are unable to pay for such repairs. Educational activities in dental hygiene are carried on by a nutritionist and dental hygienist. During the year three new full-time county health units have been added to the seventeen such units that existed in California prior to this year. The new units are in Yolo, Santa Cruz, and Ventura counties. The following counties of California now provide a full-time health service for their residents: Alameda, Contra Costa, Fresno, Imperial, Kern, Los Angeles, Madera, Monterey, Orange, Riverside, San Bernardino, San Diego, San Joaquin, San Luis Obispo, San Mateo, Santa Barbara, Santa Cruz, Stanislaus, Ventura, and Yolo.

Because of the various hazards connected with many industries of the State, it has been necessary to establish active operations in preventing such hazards. Various dusts, chemicals and air pollution are factors in the production of industrial diseases. Surveys have been undertaken in the various industries and coöperative efforts with manufacturers have been developed in order to lessen the industrial hazards and thereby prevent the production of industrial diseases. A special study of carbon monoxid poisoning in transportation is now under way.

Since 1927, when the so-called Crippled Child Act became effective in California, the State Department of Public Health has maintained clinics, as required by law, in an effort to learn of physically handicapped children who might secure treatment under the provisions of the Act. Through Social Security funds, activities to discover crippled children have increased, and no less than thirteen clinics have been conducted in California during 1937 for this purpose. Since the so-called Crippled Child Act became effective in 1927, more than one thousand physically handicapped children have received treatment through the provisions of the Act.

Communicable diseases have provided no particular problems in control during the year. Influenza of a severe type was prevalent during the early part of 1937, but no extensive outbreak prevailed.

General health conditions throughout the State have been good, and the coöperation of the medical profession in meeting the requirements of public health laws has constituted an important factor in the maintenance of a satisfactory record in 1937.

PUBLIC GOOD WILL

Sound public opinion in regard to the great question of public and private health! Public confidence and good will toward scientific medicine! These are the quests of our Association, its county societies, and the individual member. To acquire them, to retain them, and to cause their influence and power to be exercised continuously, demands that every opportunity and occasion be embraced to establish this public sentiment in the minds of the people and those who hold public office.

During 1938 and 1939, this is a major purpose of our Association. Every member should contribute of his time and efforts to bring about realization. To that purpose and end it is advised that every county unit and member participate along the following lines:

1. On every occasion offered seek to explain the purposes of organized medicine.
2. Impart information as to the truths of scientific medicine, what it has and holds for the individual's health welfare in contradistinction to the claims and unscientific representations of the cults and manufacturers of proprietary preparations. Educate your patients and friends.
3. Enlighten people in regard to preventive medicine and indicate how its application will prevent unnecessary illnesses. Point out the value of periodic physical examinations, and when conducting them do so in a meticulous and thorough manner.
4. Join with every community health movement, lend it your support and guide it along safe and sound channels.
5. Embrace every opportunity to address lay groups in their meetings upon some health or medical subject and teach them to seek advice from competent medical men.
6. Proffer advice and coöperation to local officials and legislators. Present them with facts and endeavor to help them in finding sound solutions for the health needs of the community and the State.

These are a few of the major means whereby you can develop and maintain public confidence and good will. Every day, if you are alert, you will find occasions to disseminate dependable knowledge. It is the aggregate total of these contacts and efforts that will eventuate in a better public understanding, and your interest and effort added to those of six thousand fellow members are bound to produce results evidenced in an understanding public that will be sympathetic and will lend support in the suppression of those who seek to mislead and deceive.

A great opportunity presents. Will you embrace it?

SILENT AUDIENCES

Editors and those responsible for copy in publications ponder through many an hour in their earnest endeavor to present readers with discussions and comments that are of interest, informative, and helpful. One batch of copy for a given issue is barely completed when the time is at hand for the preparation of copy for the next issue—press deadlines must be conformed to and cannot be ignored.

These writers have their hours and moments of reflection and conjecture. Having prepared copy for several issues with every care and consideration, receiving no comment or inquiry for weeks or months; having invited suggestions and response and receiving none in return—well, the writer is prone to ponder and wonder as to his silent audience of readers. Is he maintaining interest, are his articles helpful, are suggestions being followed? These questions come to his mind in his moments of retrospection. As a rule he has no answer. He must continue the preparation of articles for following issues upon his own initiative, inspiration, and enthusiasm. That is his task.

Sometimes he is tempted to write an item that is palpably inconsistent with facts just to see if he will receive a flood of letters in protest. To yield to such temptation would be most unwise, for confidence might be lost and a tempest in a teapot result.

The thought behind this general comment is that if readers would from time to time proffer suggestions as to subjects, these reading pages might be made more interesting and helpful. If a subject occurs to you, may we not receive your suggestion?

TWO RESPONSES

The score still remains "two responses" to the several suggestions and requests that one thousand members subscribe $100 each to create the nucleus for a permanent Association Endowment Fund. Probably these items have been overlooked in previous issues, therefore the suggestion is being repeated.

A permanent endowment fund, the principal sum to remain intact for all time, will provide an annual interest income that will enable the Association to expand its functions and attain greater ends for the benefit of the members and the public.

There are one thousand members, it is felt, who could contribute $100 or more to such a fund and make possible this yearly increase in income. Will they respond? Personal solicitation is not possible, hence the appeal can be made only through these columns. Will you respond? Your check this month will be most acceptable.

ASSOCIATION NIGHTS

A fine group of members of Santa Barbara and Ventura County Societies greeted President-Elect W. W. Roblee, Councilor Louis A. Packard, and State Secretary Warnshuis at an Association night on February 7. The meeting was held in the auditorium of the Cottage Hospital in Santa Barbara.

On the night of February 8, ninety per cent of the membership of San Luis Obispo County Medical Society held a special meeting that was attended by these three State officers.

At both meetings there was a discussion of state and county activities, concluding with a round-table of questions and answers. An excellent spirit prevails in these three counties.

PACIFIC COAST CONFERENCE

Upon invitations extended by the Committee on Public Relations, officers of the Oregon and Washington State Medical Societies have consented to send representatives to a conference to be held in San Francisco on Sunday, February 27. The meeting will be held in the Sir Francis Drake Hotel.

California, Washington, and Oregon have common problems related to medical services and legislation. It is felt that a general discussion as to their nature and scope would eventuate in the formulation of common policies and should be productive of mutual benefits to all three organizations and their members. By unity of purpose and action it is also felt that wholesome results will evidence themselves in a better understanding and attitude on the part of the public and that legislatures may be enlightened in regard to proposed legislation.

Our three Pacific Coast medical organizations can be helpful to each other, and through joint effort can record greater service. In a subsequent issue a summary of the conference's deliberations will be imparted to our members.

YOUR ADVERTISING FRIENDS

In each issue members will find the advertisements of business firms who are their friends. These firms desire to serve you efficiently and to your satisfaction. They may be relied upon to deal with you honestly and fairly. They will be most helpful in assisting you to acquire supplies or equipment most advantageously.

As patrons of your official journal, they merit first consideration and preference, other things being equal. The Council respectfully requests that you subscribe this support and so aid in retaining these advertising patrons. You will also be rendering a service if you advise detail men and salesmen that you prefer dealing with your friends who employ space in your JOURNAL.

Read the advertising sections of each issue and write to these advertisers. You will find many interesting and informative reading items in these sections in addition to the advertisements. Please be helpful in retaining this income revenue. Thanks.

C. M. A. DEPARTMENT OF PUBLIC RELATIONS†

Public Meetings

Education of the public is an important function of every county society. To that end county societies should sponsor public meetings at which informative talks on medicine and medical care are given. Counties having Woman's Auxiliaries will find the Auxiliary of tremendous assistance in arranging details and creating local interest and attendance. Lay organizations can also be interested and caused to join in the sponsorship of public meetings.

Competent speakers can be enlisted from your membership or from the membership at large. Careful thought should be given to the selection of subjects and the manner of their presentation. They must be of general interest and personal application, definitely instructive and informative, and presented in a manner to hold interest and obtain support.

All of which means work, thought, and time. However, such meetings will produce satisfactory returns, beget public confidence, and advance community interest. The efforts expended are well worth while, and every county society should engage in this activity. Presidents and secretaries will do well to bring this phase of society activity to the attention of their members at the next county meeting. Initiate a program and cause a special committee to direct this educational project.

Accidents on Farms*

When a farmer buys an industrial product, he pays for the cost of the industrial injuries involved in the production of that particular object. When the farmer sells his products, he must receive as a part of his selling price the costs of the accidents which have occurred in connection with the raising and marketing of his product.

It is estimated that the annual cost of industrial agricultural accidents in California is $10,000,000.

During the years 1932-1936, inclusive, there were 252 persons killed, and 45,095 employees injured in California agriculture.

It has been stated that in Kansas, in 1934, more than 50 per cent of the occupational deaths in the state occurred on the farms.

It is estimated that the farm fire losses in the United States are $100,000,000 a year and that there are 3,500 lives lost in these fires.

Since the use of electricity, liquefied petroleum gases, farm machinery, and automotive vehicles, has become common on the farms, the deaths from these uses have increased enormously.

Ladders, hand tools, infections and falls from various causes are largely responsible for the great number of injuries and deaths in which machinery takes no part.

The agricultural industry in California has, for a number of years, reported to the Industrial Accident Commission a greater number of injuries to employees than any one other industrial group. These reports do not include the accidents that occur to the farmers or their families; they are not classed as employees.

There is no agency connected with the agricultural industry that can afford to omit accident prevention from its program. They should analyze the accidents as to their cause and effect, and then remove the causes. Every such organization should also stress the necessity for proper training in the care and handling of injuries and injured persons.

Agriculture, if it so desires, can make as good a record as the other industries have made.

† The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. Charles A. Dukes of Oakland is the chairman, and Dr. F. C. Warnshuis is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. F. C. Warnshuis, Room 2004, Four Fifty Sutter Street, San Francisco.

* Reprinted from the Bulletin of the California Industrial Accident Commission.

Hospital Insurance

The Council and the Committee on Public Relations have endorsed the following hospital insurance organizations:

1. Insurance Association of Approved Hospitals, operating in San Francisco Bay regions.
2. Associated Hospital Service of Southern California.
3. Intercoast Hospitalization Association of Sacramento.

Members will do well to urge groups in their respective committees to obtain this form of hospital insurance protection.

Nurses' Unions

The appended correspondence is informative upon the subject of unionization of nurses. The attitude of the Nurses' Association is commendable and will no doubt receive the approval of physicians and surgeons. It is inconceivable that any nurse at all conversant with the history of her profession, its background and traditions of service and humanitarianism, would desert that glorious record. To repudiate her profession and calling and accept instead the classification as a labor trade-union is to relinquish ideals, and sets up a background of commercialism. Every nurse may well give thought as to what such a decision entails as to her future and the future of her profession.

(COPY)

THE CALIFORNIA STATE NURSES' ASSOCIATION, INC.

San Francisco, February 3, 1938.

Dear Doctor Warnshuis:

In reply to your letter of February 1, we are enclosing a formal statement from the American Nurses' Association in relation to unions which determines the policy of this Association.

We know of one nurses' union, Local 19923, which is established in San Francisco, Room 414, Grant Building.

We understand that nurses are being threatened with loss of employment in connection with care of union patients. You will find enclosed a copy of a resolution passed by unions at Long Beach. Other material has been issued and we will send you copies if you wish.

Efforts are also being made by the union to influence student nurses at time of graduation. The Association is anxious in every way to combat the influence of unions. We find, however, that certain conditions exist in many hospitals which give the unions ground to state that they can give nurses support in correcting these conditions. Hospitals should make every effort to improve these conditions to remove what is often just cause for complaint.

The Placement Service Committee is formulating standards for nursing personnel employed in hospitals. Only a few hospitals have given consideration to correction of the practices which are the source of grievance to their personnel.

It is regrettable that these conditions persist and give the union an opportunity to suggest that they can help to improve such.

609 Sutter Street.

Sincerely yours,

(Signed) HARRIOTT L. P. FRIEND,
Director at Headquarters.

(COPY)

AMERICAN NURSES' ASSOCIATION

New York, June 8, 1937.

Dear State President:

Inasmuch as nurses throughout the country are being approached and requested to join unions, a Committee to Study the Question of Unions for Nurses was appointed by the Board of Directors of the American Nurses' Association at its meeting held on Thursday afternoon, January 28, 1937.

As a result of the work of this committee, the Board of Directors of the American Nurses' Association has taken the following position:

1. Before allying herself with any recently organized groups, the individual nurse should ask what these new organizations can do for her and for the profession of nursing as compared with the services which her professional organizations have rendered, continue to render, and which they will be on the alert to develop for nursing and for the nurse as need for them arises in the future.

2. The Board of Directors of the American Nurses' Association, through its committee to study unions, has prepared a statement describing what the American Nurses' Association has done and will continue to do to assist the individual nurse and to promote effective nursing service for the public. It is urged that this statement be called to the attention of all of the members of your State Nurses' Association.

3. The American Nurses' Association stands for the fulfillment of all professional obligations.

4. The American Nurses' Association does not at this time recommend nurse membership in unions.

50 West Fiftieth Street.

Very sincerely yours,

(Signed) HELEN TEAL, R. N.,
Secretary.

* * *

EMPLOYMENT OF UNION MEMBERS AS NURSES

Proposition No. 40, presented by H. C. Woods of Nurses' Union No. 19923 of San Francisco.*

WHEREAS, The Nurses' Union of San Francisco, Local No. 19923, is a new, and as yet not very strong one; and

WHEREAS, It is difficult to organize nurses because of the general anti-trade union attitude of the hospital authorities and the State and County Nurses' Associations; therefore be it

Resolved, That the Nurses' Union of San Francisco, Local No. 19923, goes on record as requesting all trade-unionists, when hiring a graduate nurse, to demand that they be given one who is a member of some local of the Nurses' Union; and be it further

Resolved, That our delegate to the Central Labor Council be instructed to submit this resolution to that body for concurrence; and be it further

Resolved, That our delegate to the State Federation of Labor Convention, also, be instructed to introduce this resolution for the concurrence of that body.

COMPONENT COUNTY MEDICAL SOCIETIES

KERN COUNTY

The Kern County Medical Society met at the Mercy Hospital in Bakersfield on Thursday evening, January 20. Dr. Harry W. Lange, newly elected president, called the meeting to order.

Dr. L. A. Packard discussed further plans for the postgraduate conference to be held at Santa Barbara on March 12 and 13. Members were requested to submit topics for discussion to the local committee, consisting of Doctors Packard, William Moore, and Eric F. Colby.

The Committee on Obituaries offered obituaries on the deaths of Dr. George O. H. Buchner and Dr. J. E. Veon. Copies were ordered to be placed on file, sent to CALIFORNIA AND WESTERN MEDICINE for publication, and to the families of the deceased members.

The following are the standing committees of the Society, the last named in each being the newly appointed member:

Admissions—H. W. Lange, William Moore, and J. M. Krevitt.

Professional Conduct—Seymour Strongin, Keith S. McKee, and F. J. Gundry.

Grievances—C. I. Mead, J. M. Nicholson, and H. R. McAllister.

Program—J. M. Nicholson, L. H. Fox, and Keith S. McKee.

Publications—L. A. Packard, P. N. Root, and E. F. Colby.

Hospitals and Dispensaries—H. R. McAllister, C. I. Mead, and C. S. Compton.

Historians and Obituaries—A. R. Moodie, M. Schlothaurer, and L. B. May.

The scientific program consisted of a paper by Dr. Roderick A. Ogden on *Urinary Antiseptics.*

The meeting was adjourned, following which refreshments were served. C. S. COMPTON, *Secretary.*

PLACER COUNTY

The Placer County Medical Society met at the Freeman Hotel, Auburn, February 5.

The meeting was called to order by Dr. C. E. Lewis, President. In addition to Doctor Lewis, there were present the following members and visitors: Doctors Russell,

* Referred to Committee on Resolutions and approved at the State convention on the last day, at Long Beach, September, 1937.

Hirsch, L. B. Barnes, Paul D. Barnes, Atkinson, Lundegaard, Peers, Eveleth, Miller, Briner, Banks, Dunievitz, Vinks, Kindopp, and Hummelt. Visitors—Dr. Howard Morrow of San Francisco, President of the California Medical Association; Dr. C. E. Schoff of Sacramento, former councilor for the Eighth District; Doctors Fritz Tobias of Grass Valley, J. A. Trolan and Edwin S. Peeke, of Weimar, and Mr. Steve Dettman of Weimar.

The application of Dr. Edwin Slater Peeke for membership was read for the second time, and Doctor Peeke was unanimously elected.

Following the reading of correspondence, President Lewis introduced Dr. Howard Morrow, who gave an *Outline of the Plan for the Control of Syphilis by the State Department of Public Health.* He spoke about the Sacramento Clinic and the plan of treating pay and part-pay patients. He also gave an outline of the treatment which the Department of Public Health is advocating and showed some slides showing advanced and incipient types of syphilis and explained the different types of treatment which have been advocated. Doctor Morrow stated that continuous form of treatment is much superior to intermittent or irregular therapy.

The meeting concluded by round-table discussion, with Doctor Morrow answering questions. The discussion was general.

The meeting adjourned for refreshments.

ROBERT A. PEERS, *Secretary.*

❦

SAN BERNARDINO COUNTY

The regular meeting of the San Bernardino County Medical Society was called to order by the President on Tuesday, February 1, at 8 p. m., at the San Bernardino County Charity Hospital. About seventy members and guests were present.

Application for membership of Dr. Harry A. Tyerman of Needles was favorably voted on, as were the applications for transfer of Dr. E. Wilton Thomas of Colton, from Shasta County, and Dr. Joseph Langer of San Bernardino, from Siskiyou County.

The following program, a symposium on potent new therapeutic agents, was presented:

Benzedrin Sulphate—Fred B. Moor of Los Angeles and Lester H. Lonergan of Loma Linda.

Sulfanilamid—(*a*) General use, Joseph S. Hayhurst of Redlands; (*b*) Genito-urinary diseases, Ivan L. Finkelberg of San Bernardino.

Mandelic Acid—T. I. Zirkle of Loma Linda.

Fever Therapy—Walter Pritchard of San Bernardino.

Dr. W. W. Fenton, County Health Officer, outlined a plan for a venereal clinic.

Doctor Davy of the State Department of Public Health answered questions and a general discussion took place. In answer to the main question as to Social Service investigation of the patient admitted to the clinic, Doctor Davy did not know of a definite plan, although he felt sure that this would be adequate. He said that for first visits and diagnosis, patients would be taken care of regardless of their ability to pay, and that length of residence in the county would not play a part in a patient's eligibility to the clinic.

The meeting adjourned at 10:30 p. m.

ARTHUR E. VARDEN, *Secretary.*

❦

SAN JOAQUIN COUNTY

The regular meeting of the San Joaquin County Medical Society was held in the Medico-Dental clubrooms at Stockton on February 3.

The meeting was called to order at 8:17 p. m. by Dr. A. C. Boehmer, President. The regular meeting was preceded by a supper meeting at the Hotel Wolf, at which twenty-three members and guests were present. The paper at the supper meeting was read by Dr. Dewey Powell, who reported on the recent meeting of the seventh annual Midwinter Clinical Group on Ear, Eyes, Nose and Throat, under the auspices of the Los Angeles Research Study Club.

The applications of Dr. Julius Shreiber and Dr. W. Charles Martin being favorably reported upon by the Admissions Committee, and there being no objections from the floor, were declared elected to membership. The petition of Dr. J. J. Seibel of Lodi was presented and referred to the Admissions Committee.

Correspondence requesting membership of the San Joaquin County Medical Society in the California Society for the Promotion of Medical Research was read, and on motion by Dr. Dewey Powell, seconded by Doctor Doughty, was referred to the Board of Directors for action.

Dr. C. A. Broaddus, reporting for the Postgraduate Study Group, stated that he had seen Doctor Thannhauser in Los Angeles recently, and Doctor Thannhauser commented several times very favorably on his recent trip to Stockton for the Postgraduate Study Group. Doctor Rohrbacher reported for Doctor Gallegos, chairman of the committee appointed by Dr. John Blinn in 1937 for a conference with a group reporting on the cancer clinic for the San Joaquin General Hospital in reference to the establishment of a similar group in Stockton for pay and part-pay patients. The committee had contacted St. Joseph's and Dameron's hospitals, and both institutions had agreed to furnish space and suitable equipment. The committee recommended that the San Joaquin County Medical Society look with favor upon the establishment of a cancer clinic. Upon motion of Doctor Doughty, seconded by Doctor Hull, the matter was referred to the Board of Directors for further study and development of a plan to be submitted at the next meeting of the Medical Societly.

Under miscellaneous business the Secretary read excerpts from a report of Doctor Gilman to the San Francisco County Medical Society in reference to malpractice insurance.

The papers of the evening were presented in the nature of a symposium by Dr. H. Brodie Stephens of San Francisco and Dr. Phillip J. Lipsett of Oakland. *Acute Intestinal Obstructions* and the symposium was profusely illustrated with lantern slides and x-ray plates. It dealt with diagnosis, pathology, and x-ray findings and treatment. The paper caused considerable discussion.

There being no further business to come before the Society the meeting was adjourned at 10:30 p. m. and refreshments were served.

G. H. ROHRBACHER, *Secretary.*

❦

SANTA CLARA COUNTY

The scientific program for the January meeting of the Santa Clara County Medical Society was arranged and presented by the resident staff of the Santa Clara County Hospital. The program, which followed dinner at which Dr. D. Wilson, hospital superintendent, was host, consisted of the following papers: *The Effectiveness of "Water-soluble" Iodin in Reversing the Wassermann Reaction* by Dr. Pierce Barrette, visiting neuropsychiatrist, based on work done in the out-patient department by the interne staff; *An Original Method of Suspending the Uterus,* representing a combination of the principles of the Curtis and Coffee techniques, devised and presented by Dr. Leon Fox and illustrated by a moving picture made at the hospital; *The Peregrinations of Several Swallowed Needles* by Dr. James Bullitt, visiting roentgenologist; *A Case of Multiple Fractures (Femur, Patella, Olecranon, Skull) with Unexpected Recovery* by Dr. K. M. McCoy, resident in orthopedics; *A Summary of Obstetrical Results for the Year and a Case of External Rupture of a Pyosalpinx with Tubo-Abdominal Fistula* by Dr. J. C. Jacobson, resident in obstetrics and gynecology; *Results of the Serum Treatment of Pneumonia* by Dr. E. P. Hockenbeamer, resident in medicine; *Report of the Isolation Service* by Dr. M. B. Morehead, resident in contagious diseases; *Internal Pneumolysis in the Treatment of Pulmonary Tuberculosis* by Dr. C. G. Scarborough, resident in tuberculosis; *An Evaluation of the Results of the Newer Methods of Thoracoplasty* by Dr. Doxey Wilson, hospital superintendent.

LESLIE B. MAGOON, *Secretary.*

❦

STANISLAUS COUNTY

The regular monthly meeting of the Stanislaus County Medical Society was held at the Hotel Covell on Tuesday, February 8. Dr. Joseph Azevedo presided.

The Secretary read a communication from the State Secretary which defined the disciplinary action to be taken in the event a member accepted a reduced fee from the industrial accident insurance companies.

On written request of the City Superintendent of Schools, Mr. Bradley, Doctor Azevedo, as President of the Society, asked that he be a member of a county coördinated health council. There were no objections.

Doctor Allen stated that insurance of malpractice type can be obtained through local insurance agencies.

Dr. Harris Wilson informed the Society that he had resigned as physician for the Eagle's Lodge, in accord with a former accepted proposal.

Dr. Ernest C. Dickson, professor of public health at Stanford Medical School, gave a very interesting and instructive talk on *Valley Fever,* illustrated by lantern slides.

The meeting ended after showing motion pictures on *Sterility.* HOYT R. GANT, *Secretary.*

❦

TULARE COUNTY

The Tulare County Medical Society held its first meeting for 1938 on Sunday, January 16, at Motley's Café. A dinner preceded the meeting. Dr. R. C. Hill presided.

There were present Doctors Clarke Smith, Ruth Wells, A. Bond, Lipson, Zumwalt, A. Miller, Weiss, Powell, Hill, Sorsky, Ambrose, Guido, P. Miller, Cronemiller, Matthias, Falk, Burton, Ginsburg, Furness, Seiberth, and Fillmore.

Following the dinner, Doctor Hill introduced the guest speaker, Dr. Eliot Sorsky of Fresno. Doctor Sorsky presented a paper on *Cardiac Pain,* including in his discussion a review of angina pectoris and coronary occlusion and differentiating chest pain of noncardiac origin. The talk was unusually clear and concise and provoked general commendation. A round-table of discussion followed.

The following members were unanimously elected for the year 1938: E. R. Zumwalt of Tulare, president; Phil Barber of Porterville, vice-president; K. F. Weiss of Visalia, secretary-treasurer. Censors—R. E. Cronemiller (1941), Ray Rosson (1940), A. W. Preston (1939), S. S. Ginsburg (1938). Delegate, R. C. Hill of Exeter. Alternate, A. V. Miller of Porterville.

Dr. R. C. Hill turned the gavel over to the incoming president, Dr. E. R. Zumwalt.

New applications for membership were read from Dr. F. G. Powell of Visalia and Dr. Ruth Wells of Springville. A request for transfer of membership by Dr. Charles S. Ambrose was made.

Dr. P. D. Miller was appointed to confer with Dr. A. E. Anderson, District Councilor, relative to the holding of postgraduate conferences in this district.

Dr. R. E. Cronemiller was appointed program chairman for the year 1938.

Dr. Elmo Zumwalt brought up the matter of his resignation of Tulare County Health Officer, and the following resolution was drawn up after a general discussion of the matter.

WHEREAS, It has been called to the attention of the Tulare County Medical Society that the resignation of Dr. Elmo R. Zumwalt as Tulare County Health Officer is to be in the hands of the Board of Supervisors within the near future; and

WHEREAS, Dr. E. Zumwalt states that he has learned after five years of activity in the health of Tulare County that the ever-increasing demands in this field of activity have reached such a stage that it is no longer possible for the Health Department to operate efficiently in the manner that has been the custom in the past; and

WHEREAS, Vital statistics plainly show a very marked increase in communicable and epidemic diseases which should and ought to be controlled by efficient measures and laws; and

WHEREAS, It has been called to the attention of this Tulare County Medical Society that numerous other counties in the State of California are now operating efficiently and economically under a full-time Health Department plan; and

WHEREAS, Doctor Zumwalt has in his possession facts and figures which clearly indicate that establishment of the Health Department will not add materially to the tax burdens of this county; therefore be it

Resolved, That this Tulare County Medical Society go on record as being unanimously in favor of the establishment of a full-time Health Department in Tulare County; and be it further

Resolved, That a copy of this resolution be placed in the hands of the Tulare County Board of Supervisors, with the recommendation that the Honorable Board of Supervisors, give serious thought and consideration to the facts set forth in this resolution, to the end that without further delay the establishment of a full-time Health Department for Tulare County shall become a reality.

The meeting adjourned at 10:20 p. m.

❦

The February meeting of the Tulare County Medical Society was held on Sunday evening, February 13, at Motley's Café in Visalia.

Dr. E. R. Zumwalt presided, and extended cordial greetings to the Woman's Auxiliary, who were present. Mrs. J. C. McClure, President, responded for the women members.

The program chairman, Dr. R. E. Cronemiller, introduced the guest speaker, Dr. Glenn Myers of Los Angeles, head of the Compton Sanitarium, who spoke to us on the *Structure of the Personality.* The paper was well received and provoked considerable discussion.

Initiating our local talent program, Doctor Cronemiller presented Dr. William A. Winn as the first fifteen-minute speaker. Doctor Winn chose as his subject, *Childhood Tuberculosis,* and amplified his paper with typical and unusually excellent x-ray films.

Three new members were voted on and unanimously elected to membership: Dr. Charles S. Ambrose and Dr. F. G. Powell, both of Visalia; Dr. Ruth Wells, Springville.

KARL F. WEISS, *Secretary.*

✝

Steele, John Taylor. Died at Dunsmuir, November 28, 1937, age 38. Graduate of the University of Manitoba, Faculty of Medicine, Winnipeg, 1924. Licensed in California in 1931. Doctor Steele was a member of the Siskiyou County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✝

Wiese, Walter Fred. Died at Fresno, January 29, 1938, age 50. Graduate of the University of Illinois College of Medicine, Chicago, 1915. Licensed in California in 1917. Doctor Wiese was a member of the Fresno County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

OBITUARY

Charlotte Johnson Baker
1855–1937

In the passing of Charlotte Johnson Baker last October, San Diego lost a well-beloved and highly respected citizen. A woman who appreciated the value of her citizenship and never failed to use her influence for civic betterment.

Doctor Baker was a native of Newburyport, Massachusetts, received her A.B. at Vassar College and her M.D. at Michigan University. She served as athletic director at Vassar, following which she was assistant to Dr. Eliza Mosher at the Women's Reformatory at Sherbourne, Massachusetts.

In 1888, she and her husband, Dr. Fred Baker, with two small children, came to San Diego and became identified with the life of the community. In addition to carrying on a large and successful practice, she delivered over one thousand babies without a maternal death. She was a prime mover in civic affairs, especially those associated with the welfare of women and children.

Doctor Baker stumped the county for woman suffrage and was given credit for a large share of the big vote. She was the first president of the W. C. T. U. and of the county organization; she helped to organize the Y. W. C. A., and was its second president; she was an organizer of the Children's Home and for a time did all its medical and surgical work; she was an organizer of the Women's Civic Center, the most influential women's group in the county; also of the Young Women's Vocational Home, a charity which was utilized by every social-work group in the county, including the Immigration Service.

Doctor Baker served as president of the San Diego County Medical Society, the first woman to hold such office in California. She also served one term as vice-president of the Southern California Medical Society.

In 1913 the Bakers started on a trip around the world, but their plans were cut short by the advent of the World War, and after some thrilling adventures they reached home, after twenty-three months of wandering. About this time Doctor Baker developed angina pectoris from which she suffered severely for twenty years.

In spite of this she served for eleven years on the City Civil Service Commission, being a large factor in making it one of the outstanding Civil Service Commissions in the country.

In late years she was elected honorary member of the County Medical Society, W. C. T. U., Y. W. C. A., Women's Civic Center, and the San Diego branch of the American Medical Women's Association.

For the last six years of her life, though closely confined to her home and bed, she never lost interest in public affairs and was fully abreast of the times up to the day of her death.

LILLIAN B. MAHAN.

✠

George Otto Henry Buchner
1880–1937

Dr. George O. H. Buchner passed away on December 12, 1937, thus bringing to an untimely end a very useful life.

Doctor Buchner was born in Siskiyou County, California, and attended Cooper Medical College, where he received his degree in 1908. He started his practice in Bakersfield in 1910. At one time he dropped his work to devote all his time to oil interests, but returned to his medical practice three years ago.

Doctor Buchner was a most capable surgeon and understanding physician. His passing has been a great loss to the community.

Committee.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION†

MRS. HOBART ROGERS President
MRS. FRED ZUMWALT Chairman on Publicity

State News

Members of the Board of Directors of the Woman's Auxiliary to the California Medical Association convened at ten o'clock on Wednesday morning, February 23, at the Hotel Huntington, South Oak Knoll, Pasadena. At one o'clock, luncheon was served in their honor.

Immediately following the afternoon session of the Board, a tea, honoring the out-of-town members, is being arranged by Mrs. Eliot Alden, President of the Los Angeles Auxiliary. The place will be announced at the luncheon.

Mrs. Arthur T. Newcomb, Convention Chairman, is in charge of arrangements.

News Letter

Dear Auxiliary Members:—This has been a memorable year for the Auxiliary! Increased membership in all of the counties; greater activity along philanthropic lines; interest shown and action taken toward understanding of legislation affecting the medical profession; growing understanding between members of the groups—this last is strongly marked and most important.

We have three new county auxiliaries! News of the organization of Tulare County has just reached me; Mrs. J. C. McClure of Lindsay is the president. We are most happy to welcome this group and predict a prominent place for them in Auxiliary affairs, as their president has all of the qualifications necessary for leadership. Then, too, Tulare is a wide-awake and growing county.

Courier time again! Each member should have received, on or before the fifteenth of April, her copy of the Auxiliary publication. If you have not, kindly communicate with Mrs. Arno G. Folte, 2326 Fulton Street, San Francisco, who is Mailing Chairman. The staff of the *Courier* regrets the fact that it will not be possible to send additional copies to county presidents, as was done in November. *County Presidents, please note.* The *Courier* goes to press on the *twentieth day of March!* May I ask you to cooperate with the staff and send the information requested of you immediately, if you have not already done so. We are planning a paper with which we hope you will be pleased, and your aid is needed.

Very sincerely yours,
MRS. FRED H. ZUMWALT.

Component County Auxiliaries

Alameda County

At a meeting of unusual interest, members of the Woman's Auxiliary to the County Medical Association will come together at the Claremont Country Club on Friday, February 18, at 2:30 p. m.

Excellent music has been planned for the occasion, consisting of a string trio, with Helen Shutes, violinist, Margaret Avery Rowell, cellist, and Thelma Olin, pianist. They will play the Hayden trio in G Minor and two other numbers. Adelaide Carrothers, soprano, who is prominent in East Bay musical circles, will sing. Her accompanist will be Dorothy Wines Reed.

Presiding will be Mrs. A. A. Alexander, president of the organization. Mrs. C. A. Dukes will be hostess of the day. Mrs. Albert Boles, a member of the Board of Directors, is reservation chairman.

Mrs. Frank Law, who is prominent in civic affairs of the State, will speak on the subject, *California's Women Prisons.* As Mrs. Law is one of the best informed people in the State on this subject, a great deal of interest will be aroused by her presence.

MRS. GRANT ELLIS, *Chairman of Publicity.*

✠

Los Angeles County

The Woman's Auxiliary to the Los Angeles County Medical Association met at twelve o'clock on Tuesday, January 25, in the auditorium of the Orthopedic Hospital. Our president, Mrs. Eliot Alden, presided.

A one-act play was presented by the Department of Educational Activity of that institution. The cast comprised only handicapped children.

Dr. Harold E. Crowe was the guest speaker, and talked on *Growing Pains.*

Honor guests at the luncheon were various leaders of the Parent-Teacher Association of Los Angeles city and county.

One of the largest and loveliest affairs ever given by the Auxiliary was the reception on February 10 in honor of our national president, Mrs. Augustus S. Keck. This was held at the home of Mrs. E. Eric Larson. More than five hundred invitations were issued.

MRS. ROBERT L. CARROLL, *Corresponding Secretary.*

✠

Marin County

The last dinner meeting of the Woman's Auxiliary to the Marin County Medical Society was held on Thursday, January 27, at the Marin Golf and Country Club. The most interesting part of our meeting was an informal talk by Mrs. M. E. Axline, assistant to the National Director of Volunteer Service of the American Red Cross. Mrs.

†As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Fred Zumwalt, Chairman of the Publicity and Publications Committee, 3880 Clay Street, San Francisco. Brief reports of county auxiliary meetings will be welcomed by Mrs. Zumwalt and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue to Woman's Auxiliary notes.

Axline spoke on the Braille transcribing service, and explained its history and methods.

It is reported that our benefit bridge tea, given at the home of our president, Mrs. Thomas Gocher, in January, had cleared enough to finance fifty subscriptions to *Hygeia*. These are to be placed in beauty shops, barber shops, schools, and dental offices throughout the county.

Mrs. Bernard J. Conroy, *Chairman of Publicity.*

❦

Monterey County

Our November meeting was held at the Forest Hill Hotel, Pacific Grove, at which time Dr. Garth Parker was the honored guest at our dinner. It was during Doctor Parker's term as county medical society president that our Auxiliary was founded.

Our Auxiliary was responsible for the Christmas decorations in the children's tubercular ward of the Monterey County Hospital in Salinas.

At the January meeting, held at the Hotel Del Monte, we had the pleasure of having the state president, Mrs. Hobart Rogers, and the state corresponding secretary, Mrs. Charles Hall, with us. Mrs. Rogers gave an interesting talk on the purposes and ideals of the Auxiliary.

A very successful card party was given on January 19 at the Women's Club House in Salinas. Mrs. Garth Parker was chairman of arrangements. The proceeds from this party are to be used for redecorating the children's tubercular ward at the county hospital.

In February the Auxiliary will meet at the Santa Lucia Inn at Salinas.

Mrs. A. A. Arehart, *Chairman of Publicity.*

❦

Orange County

Members of the Woman's Auxiliary to the Orange County Medical Association were guests of the latter at the fiftieth installation banquet of their society. This very enjoyable affair was held at the Santa Ana Country Club on January 11.

During dinner we were entertained by music played by the Orange County Ensemble. The master of ceremonies for the program of music and talks that followed the dinner was Dr. H. A. Johnson of Anaheim.

Dr. Carl Omeron, a dentist from Los Angeles, gave three vocal selections. He was accompanied at the piano by his wife. Mrs. G. Wendell Olson, President, brought "Greetings from the Auxiliary." The history of the Association, founded in 1889, was sketched by Dr. Waldo Wehrly of Santa Ana, the outgoing president. There is only one living charter member—Dr. James Boyd of Santa Ana. A toast to his health was proposed by Dr. Charles C. Violett of Garden Grove; he also spoke of Doctor Boyd's medical career. An address of appreciation to outgoing officers was presented by Dr. Willis Baker of Santa Ana, and one of welcome to incoming officers by Doctor Violett.

The dinner speaker was Dr. J. Whitcomb Brougher, Jr., Glendale pastor. He spoke of the necessity of good health.

Our next meeting will be postponed until February 21 to accommodate our state president, Mrs. Hobart Rogers, and Mrs. Charles Hall, the corresponding secretary, who will be our guests at that time.

Mrs. G. Wendell Olson, *President.*

❦

Riverside County

The Woman's Auxiliary to the Riverside County Medical Society reports several new members and a representative group of women at well-attended meetings. We are looking forward to our February meeting with pleasure. At that time we will have as guests our state president, Mrs. Hobart Rogers, and Mrs. Charles C. Hall, state corresponding secretary, both of Piedmont. They will be honored at a luncheon meeting, at which Mrs. Dexter Ball of Santa Ana will also be present.

Members of the Auxiliary are working long and earnestly to make a success of the Community Chest drive, which they are actively interested.

Mrs. T. A. Card, *President.*

Sacramento County

The annual dinner dance of the Woman's Auxiliary to the Sacramento Society for Medical Improvement was held at the Sutter Club on Saturday evening, February 5.

Some two hundred members and guests met in the ballroom of the Sutter Club at 8:30 o'clock to dine and dance.

Mrs. Augusta Keck of Altoona, Pennsylvania, President of the National Auxiliary, and Mrs. Hobart Rogers of Oakland, State President, were the guests of honor. Others seated at the head table were: Mrs. William Van Den Berg, President of the Sacramento Auxiliary; Dr. William Van Den Berg, Dr. Hobart Rogers, Dr. and Mrs. Dave Dozier, Dr. and Mrs. George Briggs, Dr. and Mrs. Frank MacDonald, Mr. and Mrs. Lawrence Ashley, and Mrs. J. B. Harris.

* * *

The January meeting of the Woman's Auxiliary to the Sacramento Society for Medical Improvement was held on January 18 in the home of Mrs. George A. Briggs, 1127 Forty-fifth Street.

A short business session was followed by bridge, music, and refreshments.

Assisting Mrs. Briggs as hostesses were: Mesdames C. L. Bittner, Dave F. Dozier, L. C. Barrette, Russell Harris, Wayne Pollock, John Lawson, and S. G. Christian.

Mrs. Hugh Carmichael, *Chairman of Publicity.*

❦

San Diego County

The Woman's Auxiliary to the San Diego County Medical Society held its annual dessert bridge benefit parties in the homes of five of their members in order to raise their quota for philanthropic purposes for the year.

The parties were held in the homes of Mrs. W. D. Rolph, Mrs. H. G. Holder, Mrs. E. F. Chamberlain, Mrs. Hervey King Graham, Mrs. W. W. Russell, Mrs. Willard H. Newman, and Mrs. T. S. Whitelock, Jr.

There were individual table prizes, cake raffles, and door prizes. The affair proved to be a very popular event, and was well received by all.

Mrs. Hobart Rogers, our state president, will be in San Diego on February 17, and a special meeting in the form of a tea at the home of Mrs. Willard Newman will be held. San Diego is indeed honored to have Mrs. Rogers as their guest at this time.

❦

San Francisco County

Honoring their national president, Mrs. Augustus S. Keck of Altoona, Pennsylvania, members and guests of the Woman's Auxiliary to the San Francisco County Medical Society assembled at a formal luncheon on Tuesday, February 8, at the Western Women's Club.

Mrs. Keck was making an official tour of the western states, and during her visit in the bay region was a house guest of Mrs. Hobart Rogers of Oakland, State President of the Woman's Auxiliary to the California Medical Association.

Mrs. Hans Barkan, as president of the San Francisco unit, presided over the luncheon, and had as honor guests, Mrs. Keck and the following state officers, councilors, and county presidents: Mesdames Hobart Rogers, Frederick N. Scatena, Harry O. Hund, Lawrence Knox, J. C. Geiger, Harold Trimble, George A. Briggs, Robert M. Furlong, A. A. Alexander, Thomas Gocher, W. J. Van Den Berg, F. G. Maggs, Henry Milo; Mrs Thomas J. Clark and Mrs. William H. Sargent, past state presidents. Also, Mrs. Howard Morrow, Mrs. William C. Voorsanger, Mrs. Andrew Henderson, and Mrs. Alfred Philips.

Mrs. George S. Becker was chairman for the luncheon, assisted by Mrs. Howard B. Dixon. Decorations were in charge of Mrs. John S. Humber, whose exquisite arrangements of spring blossoms and flowers enhanced the beauty of the spacious dining room.

Following the luncheon, Mrs. Keck delivered a brilliant address, outlining the high purposes of our organizations and the work possible for us to accomplish. Also, reference was made to the important part which the Woman's Auxiliary to the American Medical Association will per-

form next June when their national convention will be held in San Francisco.

Arrangements for the convention were made by Mrs. Keck during her visit here, and plans will proceed under the direction of Mrs. J. C. Geiger as general chairman, and Mrs. George S. Becker as chairman of entertainment.

A formal Valentine dinner will be given on Monday evening, February 14, at the Society's headquarters, for the members of the San Francisco County Medical Society and their wives. Mrs. William W. Newman is chairman, assisted by Mrs. Thomas E. Gibson, who will be in charge of the evening's entertainment. Dancing, cards, and music will be included. Hostesses will be Mrs. Hans Barkan, Mrs. Jerome W. Bettmann, Mrs. Fred D. Fellows, Mrs. Hans von Geldern.

Dr. William C. Voorsanger, President of the San Francisco County Medical Society, will honor the Auxiliary as guest speaker for Tuesday, March 15, 1:30 p. m., at 2180 Washington Street. Following the short business meeting, which will include the report of the Nominating Committee, an informal reception will be held to welcome the new members, numbering sixty to date.

* * *

Typical San Francisco hospitality was manifested at the beautiful Valentine dinner party given by the Auxiliary for the members of the San Francisco County Medical Society and their wives on Monday evening, February 14, at the Society's headquarters.

Mrs. William W. Newman was chairman, assisted by Mrs. Thomas E. Gibson. Mrs. John D. Humber was chairman of decorations. Mrs. Hans Barkan, President, presided as hostess.

The spacious entrance hall was a bower of cloudy pink and white spring blossoms, interspersed with numerous candlelights, and a soft, glowing fire crackling in the huge old fireplace. In this setting, a large crowd gathered to exchange greetings and to enjoy the cocktail hour, during which the following songs were among those most graciously rendered by Mrs. Thomas E. Gibson, who was accompanied at the piano by Mrs. F. H. Redewill: The Habanera from Carmen, and the Zigeunerweisen Waltz—an arrangement of an old violin number set to music. Then Gianina Mia from the Firefly, and at the end that lovely old song, The Sweetest Story Ever Told.

Then the doors to the dining hall were thrown open, revealing another picture of charm and artistry in the arrangement of beautifully decorated tables with candlelight. The guests immediately entered, and a bountiful dinner was served, during which Mrs. Howard H. Markel favored the gathering with delightful songs, and also acted as leader for group singing. Dancing followed to a late hour, making the evening a grand success and a happy occasion long to be remembered.

Among the out-of-town guests were Dr. and Mrs. Hobart Rogers of Oakland, Dr. and Mrs. Harry O. Hund, and Dr. and Mrs. Robert M. Furlong of San Rafael.

Mrs. Harry R. Oliver, *Publicity Chairman.*

*

Santa Barbara County

The Santa Barbara Auxiliary held no meeting during the month of December. In January the Auxiliary met for luncheon at the home of our president, Mrs. C. T. Roome. Fifteen members were present. At this meeting it was authorized that the sum of $10 be given to the most outstanding nurse in the graduating class of the Knapp College of Nursing.

Doctors specializing in diseases of the nose and throat will be in convention in Santa Barbara on January 28 and 29. Their wives will be entertained by members of the Auxiliary at this time. Mrs. Henry Profant, in charge of affairs, plans a garden tour and a no-host luncheon at the Coral Casino.

On January 28 there is to be a street sale of "infantile paralysis buttons." The Auxiliary plans to take a table.

The Medical Society gave the President's Birthday Ball at the La Cumbre Country Club. The Woman's Auxiliary proved most helpful. Mrs. Harold Schwalenberg and Mrs. C. T. Roome were members of the committee in charge of arrangements. Twenty-eight couples attended the affair, the first of its kind ever held here. It proved to be a distinct success; it is expected that it will be made an annual event, growing more popular each year.

Mrs. H. E. Henderson, *Chairman of Publicity.*

*

Santa Clara County

On January 10, Mrs. William H. Milo of Mountain View, President of the Woman's Auxiliary to the Santa Clara County Medical Association, presided at a luncheon meeting of this group held at the Los Altos Country Club. Mrs. Lawrence Knox of Carmel, the district councilor, paid her official visit, and Mrs. Dana Thomas of San Jose spoke on her world travels. There were twenty-six members present.

At the regular monthly meeting, held at the St. Claire Hotel on February 7, Anna Law of the Board of Trustees of the California Institute for Women at Tehachapi was the speaker.

Mrs. R. W. Wright, *Corresponding Secretary.*

*

Santa Cruz County

The Woman's Auxiliary to the Santa Cruz County Medical Society met on January 10 at the Rio Del Mar Country Club. This was a luncheon meeting, at one o'clock, graciously presided over by our president, Mrs. Alfred Phillips.

Our guest of honor was our state president, Mrs. Hobart Rogers, who gave a very interesting and instructive talk on the *Unity of Purpose in the Auxiliary.*

Our Auxiliary is newly organized, but we are already able to forecast a most successful year.

Mrs. R. C. Alsberge, *Chairman of Publicity.*

New Treatment of Urticaria and Quincke's Edema.—Wolpe evaluates the customary treatments of urticaria and Quincke's edema, suggests that the two conditions might be related and directs attention to the difficulty in keeping all allergic substances away from sensitive patients as well as to the difficulties involved in specific desensitization. He made efforts to find a substance by which the cutis and subcutis (the system especially involved in urticaria and Quincke's edema) could be desensitized not only against the substance itself, but also against other urticariogenic substances. He reports the history of a woman, aged forty, who was subject to urticaria and who, after having been stung by a bee, developed a severe anaphylactoid urticaria which spread over the entire body. The urticaria responded to the intravenous administration of calcium. However, to free the woman from the predisposition to urticaria, the author tried desensitization with a bee venom preparation. Although it was feared that a new anaphylactoid urticarial attack might be elicited by the preparation, this was not the case and the desensitization was successful in that, although formerly the woman had had urticarial attacks every six weeks or eight weeks, during the five years following the desensitization, during which the patient remained under the author's control, she remained free from urticarial attacks in spite of the fact that her food was not restricted and that she was occasionally stung by bees or wasps. Encouraged by this success, the author tried desensitization with bee venom in twenty-five other patients with urticaria. Of these, fifteen remained entirely free from attacks thereafter, in six the attacks became less frequent and milder, and the four others could not be found for further control. After having used the bee venom desensitization for a year successfully in urticaria, the author decided to try it also in Quincke's edema. He describes the history of a man in whom the intravenous bee venom therapy not only cured the existing attack, but prevented relapses of the allergic disorder. In the subsequent four years the author treated successfully five other cases of Quincke's edema by means of bee venom therapy. He suggests that the capacity to effect an organ specific desensitization probably is not restricted to bee venom preparations, but that this effect might be elicitable also with other cutaneously active, urticariogenic substances.—*Wiener Klinische Wochenschrift.*

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association, San Francisco, June 13–17, 1938. Olin West, M.D., 535 North Dearborn Street, Chicago, Secretary.

California Medical Association, Hotel Huntington, Pasadena, May 9–12, 1938. F. C. Warnshuis, M.D., 450 Sutter Street, San Francisco, Secretary.

* * *

American College of Physicians, New York, April 4–8, 1938. Mr. E. R. Loveland, 4200 Pine Street, Philadelphia, Executive Secretary.

California State Dental Association, Stockton, April 4–6, 1938. C. E. Stabler, D.D.S., 1003 Medico-Dental Building, Stockton, General Chairman.

Medical Broadcasts*

Los Angeles County Medical Association

The radio broadcast program for the Los Angeles County Medical Association for the month of March is as follows:

Thursday, March 3—KECA, 11:00 a. m., The Road to Health.

Saturday, March 5—KFI, 10:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.

Thursday, March 10—KECA, 11:00 a. m., The Road to Health.

Saturday, March 12—KFI, 10:00 a.m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.

Thursday, March 17—KECA, 11:00 a. m., The Road to Health.

Saturday, March 19—KFI, 10:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.

Thursday, March 24—KECA, 11:00 a. m., The Road to Health.

Saturday, March 26—KFI, 10:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.

Thursday, March 31—KECA, 11:00 a. m., The Road to Health.

American Board of Obstetrics and Gynecology: Examinations.—The general oral, clinical and pathological examinations for all candidates (Groups A and B) will be conducted by the entire Board, meeting in San Francisco, on June 13 and 14, 1938, immediately prior to the meeting of the American Medical Association.

Application for admission to the June, 1938, Group A examinations must be on an official application form and filed in the secretary's office before April 1.

The annual informal dinner and general meeting of the Board will be held at the Palace Hotel on Wednesday evening, June 15, at seven o'clock. Dr. William D. Cutter, Secretary of the Council on Medical Education and Hospitals of the American Medical Association will be the guest speaker, and the diplomates certified at the preceding days' examinations will be introduced individually. All diplomates are invited to attend the dinner meeting and to bring as guests their wives and any persons interested in the work of the Board.

For further information and application blanks address Dr. Paul Titus, Secretary, 1015 Highland Building, Pittsburgh (6), Pennsylvania.

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject) to CALIFORNIA AND WESTERN MEDICINE, 450 Sutter Street, San Francisco, for inclusion in this column.

Reaction Time of Boys Faster Than That of Girls.—Boys are faster than girls in reaction time, but the difference grows less in later years of adolescence and tends to disappear with practice. This finding by Dr. Harold E. Jones, Director of the University of California Institute of Child Welfare, is among several he has published in an article written for *The American Journal of Psychology.*

In the article he describes an apparatus constructed at the Institute to measure the speed of reaction, measuring time intervals in small fractions of a second. It includes a synchronous motor chronoscope, which records the time that elapses between hearing or seeing a stimulus, and making a manual response to this stimulus.

In a study of several hundred children, Doctor Jones found marked differences between age groups. At four and a half years the average reaction time to a sound is about two-fifths of a second, dropping slightly with increasing age to an average of one-sixth of a second at twelve years. Beyond this age there is little difference. Within groups, however, individuals vary greatly, at fifteen the fastest respond in about an eighth of a second; the slowest require a quarter of a second.

The difference in time reaction of boys and girls, Doctor Jones says, is probably due in part to differences in interest and incentive. The evidence clearly indicates, however, that the age growth in this ability, up to about twelve years, is related to fundamental neuromotor changes in the developing child.

Tulare County Has First Tularemia Case.—It is a fact that the first case of tularemia was not found in Tulare County. Recently, that county has reported its first case of tularemia although the causative organism, B. tularense, is named for the county where it was first discovered. This unusual situation is explained by the fact that Doctors McCoy and Chapin of the United States Public Health Service, way back in 1910, were examining ground squirrels of Tulare County in a search for plague. In the course of their investigation they saw an organism which bore certain characteristics of B. pestis, but which was not that organism. They were unable to associate it with any specific pathogenic condition in human beings or in animals. So they named it B. tularense in honor of the California county where, through accident, it first became recognized as a distinct entity.

In 1911, Dr. Edward Francis, also of the United States Public Health Service, was detailed to Utah for the purpose of investigating cases of "deer-fly fever," so-called because of the fact that the deer fly was seemingly responsible for the transmission of the unusual disease in human beings. He found in these cases the same organism that Doctors McCoy and Chapin had discovered in California, and lesions produced in Utah rodents were identical with those in California ground squirrels. The term "deer-fly fever" was discarded and tularemia used in its stead.

Later investigations proved that the disease, primarily a disease of wild rabbits, is widespread throughout most of the United States and in many parts of the world. Furthermore, it was determined that the chief vector of the infection is the common wood tick. Credit for this interesting and important epidemiological study is due the United States Public Health Service in 1910-1911, and in later years.

California's public health workers are interested because of the fact that this disease, named after a California county, is now known throughout the civilized world. But, until now, it is not known that a case of tularemia in a human being has ever occurred in Tulare County, California.

Course on Diseases of the Digestive Tract.—The University of California Medical School announces a short postgraduate course in diseases of the digestive tract. This will be held on April 13 to 16, and will include such subjects as amebiasis, intestinal worms, diarrhea, constipation, intestinal obstruction, tumors of the colon, functional disorders of the stomach and colon, vitamins, rectal diseases, colitis, diverticulosis, the gastro-intestinal manifestations of neurosis, jaundice, appendicitis, diseases of the gallbladder, carcinoma of the stomach, digestive diseases in children, and peptic ulcer. Instruction will be given by lectures, demonstrations, and surgical clinics. The fee will be $20. Announcements, which will be ready about March 15, will be sent to alumni of the Medical School located in the western states. Others may obtain them by writing to Dean Langley Porter, University of California Medical School, Medical Center, San Francisco.

Socialized Medicine.*—How many doctors realize the dangers ahead of them? How many know of the influence working to upset the individuality of medicine? A great philosopher once said "Prejudices are like rats and men's minds are like traps." Prejudices get in easily, but it is doubtul whether they ever get out. This is especially true when socialized medicine is discussed, the social service worker, sociologist, and politician from their side and the doctor from his.

However, we must consider first of all the 130,000,000 lay persons, who must, after all, be the judges as to what will be best for them, and lay our prejudices aside for the common good. If we consider the amount of space and publicity given socialized medicine by the magazine and newspaper editors, one would naturally feel the immensity of the opposition strength. However, when we consider the actual workings and accomplishments of group or social medicine systems, it lets the air out of the balloon and seems much less formidable.

Strangely enough, neither the patients who are to be served or the doctors who do the serving are calling for this type of medicine. The sociologist and politician who make the most noise and derive the good do not want it for themselves or family, but claim they want it for those who cannot afford medical attention. The statistical structure upon which their premise is based is extremely unstable and will not bear close analysis.

All existing systems base payment upon services rendered by compulsory treatment of physicians and lead to three types of compulsion. First, the patient, whether well or sick, is compelled to pay for this service through insurance or taxes. Second, the doctor is compelled to give his service as prescribed by the "system." Third, the sick patient is compelled to accept services as rendered. *Is this the American way?*

Let us consider ourselves entering a hospital with symptoms of appendicitis. We are entered on Form PB614K with a diagnosis Number 412. We do not know the ability of the doctor assigned to us who is Number 113,420, and this becomes an overwhelming obsession. Do you believe that confidence in your doctor and his personal interest in you has curative value? This lack of confidence breeds fear and doubt, and worry engulfs and saps the strength which you need so badly. It may strangle your will power, and you begin to wonder why the doctor has not come in to see you since yesterday morning. You realize, of course, that your friends will be told you are "doing as well as can be expected." Yes, but what is expected? Your fever rises and your resistance falls. You become frantic. The Committee on Costs of Medical Care comforts you with the assurance that there is no cause for alarm. The doctor, Number 113,420, knows all about you. Did you not spend two hours filling out Form PB614K and MX16? They know you are patient Number Y1140 from Central District 14 and Subdistrict K, and you are assigned to doctor Number F71 for preliminary treatment in preparation for operation by surgeon D136. The records show you are doing nicely. The doctor does not have to come to see you because he can get all his information from a card index, Form 3D1492. This is efficiency, but bad medicine.

Socialized medicine is long on records and short on recovery. Do you wish to be classified or cured?

* A letter in *The Journal* of the Alumni Association of the College of Medical Evangelists, Los Angeles, by Paul D. Foster, M.D.

American Board of Ophthalmology: 1938 Examinations.—These will be held as follows:

San Francisco, June 13.

Washington, D. C., in October at time of meeting of the American Academy of Ophthalmology and Otolaryngology.

Also at time and place of meeting of Southern Medical Association, probably in December.

Application blanks should be obtained immediately from Dr. John Green, Secretary, 3720 Washington Boulevard, St. Louis, Missouri.

Another Human Rabies Death.—A part-time postman in Los Angeles County, engaged in the delivery of "special delivery" or registered letters, was bitten above the left ankle by a dog on October 21, 1937. Little was thought of the wound, although the pants leg was turn. Tincture of iodin was applied and nothing more was thought about the matter. (Only fuming nitric acid is of value in cauterizing the wound caused by the bite of an animal that may transmit rabies.)

On the second day of December, symptoms suggestive of rabies appeared in the postman and he was taken to a hospital, where he died on December 3. The onset was probably a few days before entrance to the hospital, as the patient complained of pain and numbness in the hands, arms, feet, and legs. In the hospital there was a stiffness of neck and back muscles, nausea, difficulty in swallowing, and convulsions.

Upon autopsy, portions of the patient's brain were removed and tissue used in animal inoculation, with results positive for rabies. Typical symptoms of rabies occurred in laboratory animals that were inoculated, and Negri bodies were demonstrated by direct smears.

This is the third human death from rabies to have occurred in Los Angeles County since June, 1937. More than two thousand rabid animals were discovered in California during 1937. Quarantines against dogs are in effect in at least two counties of California. Further efforts in the control of stray dogs throughout the State are essential in order to control this preventable but highly disastrous disease.

New Discovery in Vitamin B Complex Highly Potent.—The potent vitamin B, which already has gone a long way in the campaign to wipe out pellagra in humans and paralysis in chickens through the utilization of certain of its factors in crystalline form, has scored a new triumph. Scientists of the University of California have succeeded in crystallizing still another factor of the vitamin B complex, which, in this form, has quickly cleared up a pronounced dietary dermatitis in rats. Crude concentrates of this same factor have also been able to cure or prevent a certain type of anemia in both rats and dogs. This anemia, while not of the pernicious type, is just as destructive in its effects.

So recent is this discovery that the scientists have as yet had no opportunity to even approximate its potentialities. They merely describe it as a marked development in the field of nutrition. It has been given the name "Factor 1" until such time as a further exposition of its properties will allow a more definite identification.

Until now three other components of the vitamin B complex have been available in crystalline form. One of these, nicotinic acid amid, was crystallized at the University of Wisconsin, and has been found to be a potent specific in the treatment of human pellagra. Another member of the vitamin B complex, riboflavin, which has also been produced in crystalline form, has a marked effect in improving hatchability of eggs of poultry and also cures certain types of paralysis in growing chicks. Thiamin, or vitamin B, was the first member of the complex to be crystallized. There are one or more less well-known factors in this complex which have not yet been crystallized.

The factor crystallized by the University scientists here was obtained from a rice-bran preparation, but it is also known to exist in liver and in the outer coating and the germ of cereals. As yet there is no evidence that the new crystalline product will have any effect on the control or prevention of any ailments of man or poultry.

The discovery is announced by Dr. Samuel Lepkovsky, associate professor of poultry husbandry, who has done much notable work in this vitamin complex.

Medical School to Hold Reunion.—Medical men from all parts of the State are being invited to the semi-annual Alumni Day clinics of the University of California Medical School, to be held at the school on Tuesday, March 22. The program has been arranged by the William Watt Kerr Club, recently organized, and named after a late professor of medicine in the school.

"Moving Day" for Radiation Laboratory.—Beginning with the installation of its biological section during the week of February 7, the work of fitting up the new Radiation Laboratory at the University of California is progressing with all possible speed. The laboratory is to house the medical cyclotron, which will be given over to the production of a number of radioactive substances being used by University scientists in a new campaign against cancer, leukemia, and various other maladies.

While the medical cyclotron itself will be in place within the next month or so, it will be several months before it is in active operation. The task of wiring the great magnet is a tedious and an intricate one. Another major job is the one calling for the safeguarding of the laboratory staff through the installation of water tanks and other devices.

But four of the eight rooms in the new laboratory will be used at present, one of these being the control room. This will be completely separated from the cyclotron by a concrete wall and glass window.

At present the cyclotron is being operated on a sixteen-hour shift daily to turn out radiophosphorus for the University Medical School in San Francisco.

Syphilis and Blindness.—Syphilis has been responsible for an alarming amount of blindness and defective vision in the United States, says the National Society for the Prevention of Blindness in a statement urging widespread public observance of National Social Hygiene Day.

"There is a close relationship," the statement says, "between prevention of blindness and the campaign to stamp out syphilis, which is being so vigorously conducted by the American Social Hygiene Association and coöperating agencies. It is estimated that 15 per cent of all blindness is caused by syphilis.

"Hundreds of babies are either blind at birth or become blind later from prenatal syphilis. These tragedies are needless. It is an established fact that prospective mothers who have syphilis can bear healthy children if prenatal antisyphilitic treatment is administered in time. A blood test usually can determine the presence of syphilitic germs.

"If all cases of syphilitic expectant mothers are discovered and followed up with treatment, we may hope for a marked decrease in blindness and defective vision. This means also that a tremendous amount of human misery and economic waste will be avoided."

Alcoholics Were Ancient Problem.—Few problems which harass modern citizens are without counterpart in ancient history, declares Dr. Arthur Patch McKinlay, professor of Latin at the University of California, Los Angeles, whose academic hobby is matching modern situations with those of the ancient world.

"The recent decision of a New York judge in dismissing a charge of murder against a drunk driver opens up the age-old debate as to the responsibility of alcoholics," says Doctor McKinlay. "The ancient had to face the same problem. There were those who would hold drinkers to strict accountability. Among these was the Lesbian Pittacus, who provided in his laws that the penalty for drunk offenders should be twice as severe as for sober malefactors.

"On the other hand, the indulgent point of view had its supporters among ancient lawmakers. Among these was one Zaleucus, who formed a code of sumptuary laws for the Greek colonist's town of Locri in southern Italy. This lawmaker, according to Aristotle and other observers, recognized human frailty to the extent that though he limited a lady to one attendant, she might have two if she were drunk!"

Penrose Outlines Case of State Health Insurance at University of California.—The case of compulsory health insurance administered by the State, was presented at a lecture here by Dr. Ernest F. Penrose, associate professor of economics in the University of California. According to Doctor Penrose there are definite evidences that legislation will soon be presented placing every qualified person under this type of insurance, in order to properly equalize the costs of medical care, and to provide such care where it is not now being adequately given.

The asserted flaws in voluntary insurance were set forth at length by Doctor Penrose. The nature of the difficulties in the way of developing health insurance through commercial policies, was gone into by the speaker, and the strength and weakness of the fraternal type of insurance were also discussed. The speaker charged that voluntary insurance is often used to cover a variety of schemes in which a compulsory element is present.

Regarding illness as an insurable risk, Doctor Penrose states that it is more calculable than unemployment. "But the expenses of meeting actual losses will present more income difficulties in the case of illness than in the case of unemployment, until experience brings about a different result.

"Compulsory health insurance is a vital plank in modern reform platforms, but is not a complete remedy for existing deficiencies," the speaker said. "The main problems apparent are that of cost reduction through the organization of medical services in units of the most efficient size and the provision for more adequate medical care for persons without means.

"But the time is ripe for a big step forward," he declared. "The need for a comprehensive, statesmanlike handling of the problem by public interests and the medical profession is now apparent."

The lecture was one of a series on medical sociology arranged by the University of California Medical School.

Press Clippings.—Some news items from the lay press follow:

The Medical Indigent

In the present controversy between the California Medical Association and the management of the Los Angeles County General Hospital over the latter's conduct, the word "indigent" constantly recurs.

In such a matter, however, there are two kinds of indigents, and it is necessary to distinguish between them, particularly in the light of the Association's charge that the hospital is working indirectly toward a system of State medicine.

In the current issue of the New England Journal of Medicine, Dr. Michael Davis, Chairman of the Committee on Research in Medical Economics, points out the distinction between the legally indigent, who must be cared for at public expense both in sickness and in health, and the "medically indigent," who are fully self-supporting in health but whose financial margin is so slender that they cannot meet the expense immediately entailed in any serious sickness or accident. The first class automatically must depend on straight charity for treatment; what the latter can do for themselves depends on circumstances and disposition.

Given time, encouragement and a conscientious opposition to being objects of charity, many of the "medically indigent" can ultimately pay part or all of their bills for hospitalization, particularly if these are figured at cost. The General Hospital purports to do this and, where the beneficiary's condition warrants, it is part of its business to see that he pays what he can when he can.

Doctor Davis finds that local, state and national governments now spend about $500,000,000 in tax money for free medical care and that, if all states spent on the adequate scale of New York, this would be about doubled. Excluding the very rich and very poor, he estimates that the public at large pays about $2,000,000,000 to doctors, hospitals and related agencies. Of this, some two-thirds is in direct fees and the rest in taxes, insurance, and charitable contributions.

If correct, the figures indicate that the taxpayers have all they can do to provide adequate care for the legally indigent and to maintain essential public health services. But, generally speaking, the medically indigent are also out of the field of self-supporting private doctors and hospitals. Who is to look out for them?

Doctor Davis attempts no categorical answer. He suggests that it can be answered only from the results of a really comprehensive study of the whole subject, one in

which would participate not only doctors but experts in the fields of economics, sociology, and public costs.

It is a complex subject and one hardly to be diagnosed dogmatically on the basis of present information.—Editorial, Los Angeles *Times*, February 14, 1938.

San Francisco City Employees' Health Insurance Starts Soon

Registration, Contracts, Begin About March 1

San Francisco's plan of health insurance for municipal employees, authorized by charter amendment a year ago, will be in operation within two weeks.

Shortly after March 1, membership certificates will be ready, and physicians and surgeons will be under contract to the Health Service Board.

Such was the general belief last night as the City Retirement Board approved the schedule of fees proposed by the Health Service Board. At the same time, it approved the type of contract to be entered into with physicians and surgeons.

$2.50 Per Month

The plan calls for a monthly assessment of $2.50 upon each city employee who becomes a member. All must be members except those exempted on religious grounds or because of prior health insurance commitments.

Members of city employees' families will be permitted to enter the plan at the same rates for adults, reduced rates for children.

The Board heard protests from members of the Library Staff Association, who pointed out that the compulsory $2.50 monthly dues will work a hardship upon those receiving $100 a month or less. Further consideration will be given to low salaried city employees, the Board announced.

Director Appointed

Approximately 140 physicians have already committed themselves to participate in the plan and numerous others are expected to enter into contracts. Through Dr. T. H. Kelly, the San Francisco County Medical Society expressed approval of the plan, with the understanding that revisions will be in order at the end of one year.

Dr. W. B. Coffey has been appointed medical director for the Health Service Board and will be recompensed at a rate based upon the total membership. Members will be permitted to choose their own physicians from those under contract. Physicians will be recompensed according to the approved schedule; hospitals will receive $7.20 a day for each member received.—San Francisco *Examiner*, February 16, 1938.

Transient Medical Test Banned

State Rules Against County in Social Disease Fight

There is no way to keep transients infected with social diseases out of California.

The Los Angeles County Supervisors learned that yesterday in a ruling by the State Board of Health, which said enforcement of the State law authorizing physical examinations at the State's borders could not be limited to migratory individuals.

Must Have Evidence

The State Board, taking notice of a resolution adopted by the Supervisors on January 25, said it recognized the menace of social diseases brought to the State by thousands of transients, but that the law requires evidence of disease and not mere suspicion of it before a visitor may be restrained.

The Supervisors' resolution asked that all transients be inspected at the State's borders. It was backed by a report from County Health Officer J. L. Pomeroy that 10 to 15 per cent of transients who come to Los Angeles are infected with social diseases.—Los Angeles *Examiner*, February 14, 1938.

Dog Tears Girl's Cheek Bone-Deep

Four-year-old Angela Santa Ana, suffering from the worst dog bite reported to the Health Department in several years, today was under treatment for possible rabies infection.

The child was bitten by the same small fox terrier that bit four other children yesterday. Her cheek was laid open bone-deep from eye to lip. The animal now is under observation in the humane shelter.

Others given the Pasteur treatment with Angela were Louis Hernandez, bitten on the hand, and Virginia and Josephine Martinez, each bitten on the finger. The fourth victim, Sam Martinez, was bitten on the lip, but has not been located for treatment.

The dog, it was said, was owned by the Martinez family, of 466 North Fremont Street.—Los Angeles *Evening News*, February 15, 1938.

Doctors and Lawyers to Tilt Over Court Rules

Santa Barbara, Feb. 13. — The Santa Barbara County Medical Society and the Santa Barbara County Bar Association will dine together at El Paseo tomorrow night and then enter verbal battle over rules of evidence as they now apply to the testimony of medical experts.

"Some Aspects of Medical Jurisprudence" is the tactful fashion in which the subject of the evening is announced. William I. Gilbert, Los Angeles authority on medical testimony in court, and Dr. Gilbert V. Hamilton, nationally known alienist of Santa Barbara, are the headline speakers.

Paul Sweetser, President of the Santa Barbara County Bar Association, will preside. Discussion is predicated on complaint of many physicians that their testimony is too chopped up by demands for "yes" or "no" answers to hypothetical questions to be of little real value to judge and jury.

Experts complain that they must refrain from being positive. Many judges and attorneys agree with them. There is another faction on the legal side, however, which maintains that too much latitude permitted experts in the witness box would give them undue power in swaying court and jury with theory and opinion.—Los Angeles *Times*, February 14, 1938.

* * *

Los Angeles Trailer Health Ordinance

Trailer camps are required to abide by strict health and sanitary regulations under an ordinance which today bore the approval of the City Council.

The measure provides that house trailers may be located on private premises only with the consent of the tenant of such private premises.

If occupants of house trailers desire to remain in the city more than ninety days in any twelve months, they must obtain permits from the City Health Department. The application fee is $5.—Los Angeles *Herald-Express*, February 10, 1938.

* * *

Chemical Treats Virus

Sulfur Compound Cures Distemper

New York, Feb. 10.—(AP)—Discovery of a sulfur compound, the first chemical in the history of medicine ever found effective in treating a virus disease, was announced today in science.

Flu and infantile paralysis are examples of human viruses. The new chemical cures distemper, an animal virus, and for the first time offers hopes for cures in the human field.

The announcement was made by A. R. Dochez, the man who found the virus of the common cold, and C. A. Slantez. The new drug is sodium sulfanilyl sulfanilate.

While chemicals have been found to treat most of man's germ diseases, no chemical has ever been effective against viruses.—Los Angeles *Examiner*, February 11, 1938.

* * *

"A Magnificent Job"

Exaggerated and inaccurate reports of epidemic conditions in the San Joaquin Valley among migratory workers have done a serious injustice to the State Department of Health and its workers.

Using part State and part Federal funds, the State health authorities operate hospitals on wheels in their drive against disease among the 25,000 families who are spending the winter in camps in California.

In view of misquotations attributed to the medical adviser of the Federal Farm Security Administration, it is a pleasure to quote the tribute of a spokesman for FSA to our State health authorities. Says he:

"The graver injustice is to the State Department of Health, for by inference, Doctor Williams is made to say that they are negligent and inefficient, and nothing could be more remote from accuracy.

"As a matter of fact, to my own knowledge, they are doing a magnificent job. We could actually have a situation here in California that would justify scareheads if it were not for the professional ability, devotion, and organizational skill in the use of their relatively small forces of such men as Dr. Dickie, Dr. Farnsworth, Dr. Uhl, Dr. Stadtmuller and others in executive positions, and their field staffs. And also the county health officers in the areas of chief congestion, the school nurses, the nursing service of the Council of Home Mission, and others of this intelligent and devoted brigade. No amount of praise or credit is too high for any or all of them."

We have criticized the attitude of some officials toward migratory workers and their families and we welcome all the more the opportunity to testify that the hearts of

Californians can be as warm as any.—San Francisco *News*, February 8, 1938.

"Socialized" Care of Sick

Washington, Jan. 29.—The long and often bitter controversy over establishment of a system of so-called "socialized" medicine in the United States approached a climax with publication of an inventory of the nation's health, prepared by the United States Public Health Service.

The survey was a thorough investigation by trained WPA workers of the health or disease condition of 2,800,000 persons in nineteen states. The findings promise to bring the problem of adequate medical attention for all people up for solution in the near future.

Preliminary parts of the survey report show that in a country which has many of the world's outstanding medical research organizations, the finest hospitals ever built and more than 110,000 practicing physicians, about half of the population is still not getting adequate medical care for either minor or major illnesses.

Needless Deaths

In general, the report said, the less money a person earns the greater are the chances that he and members of his family will die from diseases which could be controlled with proper medical treatment.

Approximately 55,000,000 of America's 130,000,000 population are members of families which have annual incomes of less than $1,000 per year, the survey disclosed, and "this group shows a higher rate of illness and a higher death rate, but receives less medical care for those illnesses or to prevent those deaths than the higher bracketed income groups."

In other words, public health service officials said, poor people cannot afford to get sick, yet they are sick more frequently and for longer periods than other groups primarily because of lack of money to pay for medical treatment.

Sickness Costs

The average yearly cost of treatment for a case of cancer is $342, for appendicitis $170, for diabetes $126, for pneumonia $98, for tuberculosis $61, and for heart disease $48, they said. "But if a member of one of these households develops cancer, pneumonia, diabetes, or appendicitis, the minimum cost necessary for adequate medical care can scarcely be made available from an income already crowded with expenses for food, clothing, and living quarters."

Health officials scattered through five different departments of the Federal Government said the health survey had brought the question of medical care of the poor to the point where a decision whether the Government should aid the indigent, and the physicians, themselves, must be made in the near future.—Los Angeles *Examiner*, January 30, 1938.

* * *

Larger Clinic Staff Urged

Additional doctors and nurses are required at the Health Department clinics to treat the increasing number of men and women with social diseases.

The Health Commission on Saturday forwarded a request for an increased personnel to the City Council.

Dr. George Parrish, City Health Officer, advised the Board that more than one hundred women patients were daily receiving treatment.—Los Angeles *Examiner*, January 30, 1938.

Every Sixth Person in California Getting Aid From Public

Sacramento, Jan. 31.—(INS)—Every sixth person in California is receiving some form of relief at public expense. In a survey completed today by International News Service it was revealed it costs more than $12,500,000 per month to care for approximately 306,883 individuals, either unemployed or physically unable to make their own livelihood. This does not include the thousands of persons cared for by welfare agencies such as the Community Chest, Salvation Army, Volunteers of America, various church charities or similar organizations.

It is costing California taxpayers more than $3,000,000 per month to care for some 260,000 persons by the State Relief Administration, a load 33 per cent higher than this date a year ago. In addition, the Federal Government contributes more than $4,000,000 monthly to about 333,000 persons on Works Progress Administration projects.

The State's aged aid assistance is growing by leaps and bounds, with the present load placed at 98,000 at a cost of nearly $3,500,000 per month and with more than 20,000 persons waiting for action on their applications.

Aid to some 25,000 dependent children costs another $453,000 a month, while the State's 5,233 sightless get $251,592.

Indigent aid furnished by counties runs $850,000 monthly and along with other relief assistance continues to increase.

How the relief load has grown during the past eight years is shown by figures which reveal that during the 1930-1931 fiscal year only 9,896 persons were receiving aged aid, which totaled $1,105,754.

The estimated load for the current fiscal year, ending June 30, is 108,427 persons. This will cost an estimated $7,916,579 monthly.

Blind assistance costs $264,486 for 1,528 sightless. This year 5,360 blind will get $697,400.

Needy children during 1930-1931, numbering only 15,607, received $1,610,708. This year's California's 31,584 dependent minors will get $1,912,134.

Unless there is a sharp reduction in State Relief Administration loads, the State may find itself running short of funds for this agency. At the present rate it is estimated it will cost $31,000,000 for the fiscal year ending June 30. There was only $48,000,000 budgeted for this purpose for the biennium ending June 30, 1938. This would leave a balance of only $17,000,000 for relief needs next year.—Los Angeles *Herald-Express*, January 31, 1938.

* * *

One Hundred and Six Thousand Killed by Accidents in 1937

Chicago, Feb. 1.—(INS.)—Death took no holiday in 1937.

One hundred and six thousand persons were killed in accidents in the United States.

Three hundred and seventy-five thousand others were permanently disabled.

Nine million four hundred thousand others were injured.

The estimated cost of this great jamboree of carelessness, based on partially completed figures announced today by the National Safety Council, was $3,000,700,000.

The grand total of accidents dwindled slightly from the toll in 1936. Experts credited this fact to a mild summer, which brought a decrease in heat deaths, rather than to greater caution among Americans. However, safety campaigns received some credit. The accident table was as follows:

	1937	1936	Per Cent of Chg.
All accidents	106,000	110,248	— 4
Traffic	39,700	38,089	+ 4
Home	32,000	37,500	—15
Occupational	19,000	18,000	+ 6
*Public	19,000	20,000	— 5

* Nontraffic.

The saving in life effected by moderate summer weather more than offset the increase of 1,600 in motor accident deaths and of 1,000 in occupational fatalities, the statistics show.

Major disasters played an unimportant rôle in the toll. The great majority of deaths occurred in one's and two's.

Falls were second only to autos, claiming 26,000 lives.

Burns killed 8,000, drownings 7,000, railroad accidents 4,000, not including crossing crashes; firearms 3,000, gas poison 2,000, other poisons 2,000, and miscellaneous causes 15,000.

The child accident total dropped sharply from 16,200 in 1936 to 15,000 in 1937.

Cut Auto Deaths

Twenty states cut auto deaths in the face of increased travel.

Milwaukee emerged as the nation's safest big city. It had only 10.8 deaths per 100,000 population in 1937.

Among cities under 500,000 population, Minneapolis was safest and Memphis next.

In larger cities, pedestrians were the largest single class of victims in all traffic accidents.

Steam railroad accidents brought 4,580 deaths during the first ten months of the year, although only twelve of the victims were passengers on trains. Most of the victims were trespassers. Many were employees. Some were motorists.

Forty airplane passengers were killed, the partial tabulations show.—Los Angeles *Herald-Express*, February 1, 1938.

Socialized Health Service Illegal

San Francisco Foundation, with No Choice of Doctor, Hit by Ruling

San Francisco, Feb. 18.—(AP)—A socialized medicine plan, under which families would pay a monthly fee to insure medical care in time of sickness or accident, was declared illegal here today by Attorney-General U. S. Webb.

Webb told Dr. Charles B. Pinkham, Secretary-Treasurer of the State Board of Medical Examiners, that circulars of the so-called "Health Foundation" indicated the plan violated the State Business and Professional Code, which prohibits the practice of medicine "under a fictitious name."

Webb said the members of the Foundation apparently had no choice of their physician, who would be selected and paid by the Foundation, and thus there was "no professional relation as between physician and patient."—Los Angeles *Examiner*, February 20, 1938.

* * *

Cure for Infant Disease Found

Bloomington (Ind.), Feb. 19.—(AP)—In seaweed and the peels of lemon, orange, and grapefruit, the University of Indiana School of Medicine has discovered a new remedy for cholera infantum.

The medicine is a mixture of agar-agar and pectin. The agar comes from Japanese seaweed; pectin from the peels.

The two promise the virtual finish of cholera infantum, once dread infant killer, curbed in recent years by better diets, but still taking lives in July, August, and September under the newer name, "diarrhea of infants."—Los Angeles *Times*, February 20, 1938.

Court Rules Wright Sane; Release Seen in Five Days*

Attorneys Clash with Judge; Airport Man Promises to Quit Liquor

Paul Wright, who was insane, according to a jury verdict, when he killed his wife and his "best friend," is sane now, but he cannot go free until five days have elapsed. Superior Judge Ben B. Lindsey, who yesterday declared that the evidence in favor of Wright's present sanity was "overwhelming," announced that under the law, Wright cannot be released for five days, during which time the question is still subject to reopening.

Subject to Demands

The District Attorney's office is entitled to demand that Wright submit the question of his present sanity to a jury—he chose to have the court decide—or any "interested party," including relatives of the victims, may make such a demand through the District Attorney.

However, the likelihood that any such action would be taken was so small that apparently all Wright has to do is to count the days until he goes free. . . .

The decision came at the end of a hearing that was marked by vociferous clashes between attorneys and the court, Wright's solemn promise to let liquor alone, a warning by Leavy that "if this man is released, I hope the court will never regret it," and Judge Lindsey's immediate and vigorous criticism of the deputy.

During it all, Wright sat, looking rested and refreshed but somewhat bewildered as the words clattered about his head. At the end of the hearing he filled out a questionnaire for the records and was returned to the psychopathic ward of the General Hospital.

Acquaintances Testify

The hearing began tamely enough with testimony by David P. Fleming, President of the Los Angeles Baseball Club; Police Chief E. H. Adams of Burbank; W. H. Thompson, airport ticket seller; Miss Pauline Roach, who was Wright's secretary; Oscar E. Wilkinson, jail attache, and Captain Clem Peoples, chief jailer.

They all said that they believed Wright was sane at present.

Then came the parade of the psychlatrists.

Phychiatrists Agree

Dr. M. J. Rowe, who testified at Wright's trial that he believed Wright was sane at the time of the shooting of Mrs. Evelyn Wright and John Kimmel, said that he had not changed his opinion.

"Evidently he was carrying out his own personal code when he acted as he did," said the doctor.

"If liquor had not entered into the picture, this thing might not have happened?" inquired Judge Lindsey.

"Probably not," said Doctor Rowe.

"He was sane then and he is sane now," testified Dr. Victor Parkin.

Declared Sane

Dr. Gustave Boehme, third of the alienists who testified at Wright's insanity trial in which the jury verdict saved him from the penalty of his manslaughter conviction, also declared that Wright was "sane all the time."

"I do not think that it is likely that he would repeat his act—if he stops drinking and remembers the lesson he has learned," said the witness.

Dr. Samuel Marcus, who testified for the defense at the original trial, clung stoutly yesterday to his theory of "hysterical dissociation" of personality, declaring that he still believed Wright was mentally unconscious at the time of the shooting.

"I never said he was insane," he testified. "He is sane now. The trial through which he has just gone is the greatest possible test of emotional stability."

Alcohol Blamed

Dr. M. G. Carter, also blaming alcohol for much of the trouble, said that Wright was sane, but advised "a certain amount of supervision by his relatives."

"Sane," said Dr. Charles L. Allen.

"Sane, but of an unstable disposition," said Dr. Edson H. Steele. "It would perhaps be a good idea to place him in a state hospital for a time, for observation."

"Sane. Probably would never do it again," said Dr. E. H. Williams.

Then Leavy arose.

"This is a very peculiar situation," he said. "I believe that it would not be unreasonable to keep this man under observation for a time.

"I hope, if he is released now, that the court will never regret it. The future responsibility will rest with this court."

Judge Objects

That brought, from Judge Lindsey, sharp-edged remarks.

"I am not dodging any responsibility, but I refuse to acknowledge that it rests on this court," he said.

"I haven't the nerve to send this man to a state hospital. In all my experience, this has been one of the few times when alienists were 100 per cent agreed on their findings.

"Mr. Leavy should have made his protests to the trial judge and should have asked for a jury trial on the issue now before us, if he wanted one. The burden should never have been placed on this court."

Attorney Jerry Giesler, who defended Wright, asserted:

"The duty of the prosecutor ended when the jury brought in its verdict declaring Wright insane at the time of the shooting."

Sobriety Pledge

Returning to Wright—temporarily the forgotten man as the wrangle proceeded—Judge Lindsey instructed him to stand.

He read him a lecture on good behavior, particularly with reference to liquor.

"I have your word and your promise that you will not drink any more?" he asked.—Los Angeles *Examiner*, February 22, 1938.

Paul Wright Quits Hospital Today*

"White Flame" Slayer of Wife, Best Friend Legally Free

Paul Wright, "White Flame" slayer of his wife, Evelyn, and his friend, John Kimmel, will return to society today, with the full citizenship privileges of any free man.

At 10 o'clock this morning he will walk from the psychopathic ward of the General Hospital legally free.

Wright was declared legally sane last Monday, after eight alienists stated he was no longer mentally unbalanced.

The same jury which found the former aviation executive guilty of manslaughter in his first trial later declared him insane at the time he shot and killed his wife and his friend last November 9.

Among those who will be on hand to greet Wright on his return to the big outdoors is Jerry Giesler, his attorney.

Giesler said last night that Wright intends to remain in Los Angeles, find a job and go to work to make a living and forget the unpleasant features of his experience.—Los Angeles *Examiner*, February 27, 1938.

Lost Doctor's Body Recovered

Country Physician Caught in Hailstorm

Cedarville (W. Va.), Feb. 21.—(AP)—Friends brought back from the woods today the briar-scratched body of a 72-year-old country doctor who lost his way answering a sick call in a storm and died of exposure.

Dr. James Henry Chapman saddled his horse Saturday night after receiving the call, and rode into the hills.

A heavy hailstorm struck this area after Doctor Chapman's departure. Searchers found that he had tied his horse, and tried to go ahead on foot. He fell over a cliff a few hundred feet away.—Los Angeles *Times*, February 22, 1938.

LETTERS

Concerning first demonstration in California of x-rays by Founder-Editor Philip Mills Jones.

San Francisco, California,
January 29, 1938.

To the Editor:—The beautiful tribute to Dr. Philip Mills Jones in the January number of CALIFORNIA AND WESTERN MEDICINE brings to my mind the fact that he was, I believe, the first on the Pacific Coast to demonstrate the value of the then recent discovery of the x-ray by Professor Roentgen.

The San Francisco *Examiner,* Thursday morning, February 20, 1896, states:

That proper investigation and experiment might be made in this city, the *Examiner* sought and obtained the services of three professional men of this city to test the Roentgen discovery, furnishing them with all the apparatus obtainable in this part of the world. After three days of discouraging failure success came, a success so complete that the photographs made yesterday in this city during the *Examiner* experiments are as good, or better, than any others that have been described in the technical publications of the country.

The three specialists selected were: Dr. Philip Mills Jones, who had general charge of the experiments; Dr. H. P. Carlton and Mr. Allen H. Babcock. Doctor Carlton had devoted much time to amateur photography, and Mr. Babcock was a clever electrician.

In the *Occidental Medical Times,* Sacramento, May, 1896, page 309, there appears:

San Francisco Medical Society, Regular Meeting, March 10, 1896. The Roentgen or X-rays: Dr. Philip Mills Jones gave a demonstration of the Roentgen or X-rays.

I am writing this for your information,
1980 Washington Street.

Cordially,
W. R. P. CLARK, M.D.

Concerning California Publications in Pharmacology.

To the Editor:—We are glad to announce the inauguration of *The University of California Publications in Pharmacology,* under the editorial supervision of Doctors Gordon A. Alles, T. C. Daniels, Mayo H. Soley, and Chauncey D. Leake. These studies will appear irregularly in the series, but will be consecutively paged to form volumes of about 500 pages. The subscription price per volume will be $5. Bills, however, may be rendered annually on July 1 for the issues received to that date. The first of these papers should appear early in the spring of 1938, and it is expected that a volume will be completed about every two years.

The University of California Publications in Pharmacology will contain reports of original pharmacological studies from the University laboratories, together with occasional review and general articles relating to the science. The following titles, now in press, illustrate the scope of the series:

1. Prolegomenon to Current Pharmacology, by C. D. Leake.
2. Chemotherapy of Leprosy: Clinical Evaluation of Anti-Leprosy Drugs, by H. H. Anderson, G. A. Emerson, C. D. Leake, P. A. R. Cerqueira, E. Hurwitz and H. Moura-Costa
3. Local Anesthetic Activity of Certain Ethyl Ester Derivatives of 2-Furoic Acid, by N. M. Phatak.
4. Skin Absorption of Insulin with *Mucuna pruriens,* by B. E. Abreu and G. A. Emerson.
5. Narcotic Properties of Alkoxyethyl Carbamates, by G. A. Emerson and B. E. Abreu.
6. Notes on the Pharmacological Action of Dinitrophenylmorphin, by G. A. Emerson, S. J. Klyza, N. M. Phatak and C. D. Leake.
7. Metabolic and Respiratory Effects of Dinitrophenylmorphin, by B. E. Abreu, N. M. Phatak, G. A. Emerson, and C. D. Leake.
8. Blood Sugar Response of Habituated Rabbits to Increments in Dosage of Morphin, Dihydromorphinone and Dinitrophenylmorphin, by G. A. Emerson and N. M. Phatak.
9. Comparative Physiological Actions of Phenethylamin and of the Betahydroxyphenethylamins, by G. A. Alles and P. K. Knoefel.

These studies will be produced in paper covers and printed in the usual style of our monographs in series, page size 6⅛ by 9¼ inches.

We should be glad to send you on request a sample copy of No. 1 without charge.

Berkeley, California.

(Signed): UNIVERSITY OF CALIFORNIA PRESS.

Concerning annual membership statistics of Los Angeles County Medical Association.

(COPY)

LOS ANGELES COUNTY MEDICAL ASSOCIATION
ORGANIZED JANUARY 31, 1850
INCORPORATED JUNE 24, 1878
REINCORPORATED MARCH 29, 1926

To the Editor:—Referring to suggestions given in your letter of January 10, we wish to report that we have completed the table of membership totals, and enclose two copies for your files. We have been unable to ascertain the membership for the year 1902.

Very truly yours,
S. K. COCHEMS,
Executive Secretary.

Total number of members at the end of each year:

Year	No. of Members	Year	No. of Members
1901	16	1920	997
1902	?	1921	1098
1903	203	1922	1211
1904	278	1923	1241
1905	315	1924	1369
1906	359	1925	1450
1907	393	1926	1486
1908	398	1927	1537
1909	402	1928	1620

1918	819	1937	2357
1919	856		

Concerning the East Bay Hospital Conference: Oakland Area.

To the Editor:—Ellard L. Slack, Superintendent of Merritt Hospital, will head the East Bay Hospital Conference as president for 1938 as the result of the annual election of officers held by the representatives of twelve hospitals in the metropolitan Oakland area.

Dr. Benjamin W. Black, Medical Director of Alameda County, was named as vice-president and Alfred E. Maffly, Superintendent of Berkeley General Hospital, as secretary-treasurer. The East Bay Hospital Conference, official organization of the hospitals in this area, had as its outstanding achievement in 1937 the organization of the Insurance Association of Approved Hospitals, providing a mutual nonprofit insurance plan and giving complete hospital care to all members paying a premium of 90 cents per month.

President Slack reports 10,000 members have already been enrolled in this attempt to reduce cost of hospital care so that it will not become a burden on those in lower income brackets. Membership in the East Bay Hospital Conference, he adds, is composed of all hospitals maintaining high standards approved by the American College of Surgeons which have been officially endorsed by the national governing body.

The exchange of bad-debt information has been another new achievement of the Conference during the past year. Nine copies are made of every account turned over by any hospital member of the Conference for collection. These copies are of nine different colors and one copy is dis-

tributed by the secretary to each participating private hospital. Each hospital thus builds up its own bad-debt file and has in alphabetical order the bad-debt accounts of all the other hospitals in the community. The system has already proved its worth by revealing several patients who have had bad-debt records in several hospitals, where the second hospital has innocently extended credit to the patient who was already on another hospital's bad-debt list. Should such a patient again apply to a second hospital for credit, his past bad-debt record will already have preceded him and will be on file at the hospital. The second hospital will thus be in a position of refusing the bad credit risk or demanding adequate credit protection, and even demanding that the original hospital bill be paid to the other hospital before further credit is extended. This coöperative system promises to save the hospital members of the East Bay Hospital Conference many thousands of dollars of unpaid hospital accounts.

Following are the hospitals included in the Conference: Alameda County Hospital, Alameda Sanatorium, Alta Bates Hospital, Berkeley General Hospital, Children's Hospital, Cowell Memorial Hospital, East Oakland Hospital, Fairmount Hospital, Merritt Hospital, Peralta Hospital, Providence Hospital, and Richmond Cottage Hospital.

Respectfully submitted,

ALFRED E. MAFFLY,
Secretary-Treasurer.

Concerning Clinical Laboratory Law of California: Chapter 804, Statutes 1937.

BOARD OF MEDICAL EXAMINERS
STATE OF CALIFORNIA

San Francisco, California,
January 26, 1938.

To the Editor:—We thought you might be interested in the enclosed copy of Opinion No. NS-812, rendered on January 13, 1938, to the Board of Chiropractic Examiners by Attorney-General U. S. Webb, Lionel Browne, Deputy, and leave to your discretion whether same should be published in CALIFORNIA AND WESTERN MEDICINE.

Very truly yours,

C. B. PINKHAM, M.D.,
Secretary-Treasurer.

(Editor's Note: The above opinion appears in the Special Article section in this issue, on page 230.

Concerning Dr. A. W. Meyer's Article.*

Stanford University, California.
January 24, 1938.

To the Editor:—I heartily appreciated receiving a complimentary copy of CALIFORNIA AND WESTERN MEDICINE for January, and I am greatly indebted to you for your generous and comprehending comment on my article. Since a companion article dealing with conditions in the shoulder, which appeared in the *Archives of Surgery*, actually did attract attention both at home and abroad, you should feel especially complimented on your words. Time may show that I am mistaken in some of my interpretations, but none of us here have been able to think of any other explanation than that offered, and in any case the destructions are such that medical men can no longer ignore them.

Stanford University,
Department of Anatomy.

With warmest regards,

Very gratefully yours,

A. W. MEYER.

Concerning rabies quarantine in Los Angeles County.

February 9, 1938.

To Members of the State Board of Public Health:

Report of action of Los Angeles County Board of Supervisors in re request to outline extent of area to be included in rabies quarantine:

Doctor Pomeroy was called before the Board of Supervisors on February 8. Supervisor Legg led the opposition on all details, stating that dog lovers would be flooding the Supervisors' chambers. Supervisor Lee Ford said if there could be exceptions in Santa Monica and Malibu districts, he would be in favor of the quarantine.

Mr. Roland McNitt, attorney representing dog owners of Altadena and Pasadena, spoke in favor, and recommended that the Supervisors approve Doctor Pomeroy's suggestions sent the State Department of Public Health.

Supervisor McDonough was in favor, and said that it meant if the Los Angeles County Board of Supervisors approve Doctor Pomeroy's request, that the quarantine established by the State could be modified from time to time as conditions warranted.

Supervisor Jessup moved that the Supervisors direct a letter to the Director of the State Department of Public Health giving their approval to Doctor Pomeroy's request.

Mrs. Rosamond Mae Wright, representing the dog owners, said she was in favor of this, but that in former days some of the officials in charge of quarantine misdirected their activities. She said the place for dogs is in yards, in homes, or on leash.

Doctor Pomeroy reported on spot quarantines, and stated that the city of West Covina was drawing up stringent regulations with reference to rabies, and also that the State quarantine was in effect at Long Beach. (Long Beach not under quarantine.)

Doctor Pomeroy agreed to every exemption which was requested in the matter of territory.

It was agreed that a letter be addressed to the State Board of Public Health approving Doctor Pomeroy's request, and that the Supervisors outline the area they desired placed under quarantine. This letter is supposed to be mailed Wednesday or Thursday of this week. On receipt of same, copy of the proposed quarantine will be forwarded to the members of the Board, with the request that they approve or disapprove.*

Very truly yours,

WALTER M. DICKIE, M.D.,
Director of Public Health.

Concerning a Spanish edition of the United States Pharmacopoeia.

COMMITTEE ON REVISION
OF THE
PHARMACOPOEIA OF THE UNITED STATES OF AMERICA
1930-1940

Philadelphia, Pennsylvania,
February 4, 1938.

To the Editor:—I enclose an announcement of the publication of the United States Pharmacopoeia, Eleventh Revision, in the Spanish language. This has just been released, and I would appreciate your making this announcement in the current number of your journal.

This service which the Pharmacopoeia has rendered in those divisions of the United States where the Spanish language is spoken and in Cuba, is also being appreciated in other Pan-American countries. It is a friendly gesture, and through many years has assisted in establishing a contact with the republics of Central and South American countries, which is very important in our Pan-American relations.

E. FULLERTON COOK,
Chairman, United States Pharmacopoeia Committee on Revision.

* * *

A NEW SPANISH EDITION OF THE UNITED STATES PHARMACOPOEIA

The Spanish Edition of the United States Pharmacopoeia, Eleventh Decennial Revision (U. S. P. XI), sponsored by the Board of Trustees of the United States Pharmacopoeial Convention, has just come from the press.

This edition was translated under the auspices of the Pan-American Sanitary Bureau in Washington. It forms a volume of 695 pages, with a detailed index, and at the end there is a list of official titles in both English and Spanish. Auxiliary Committees of Cuba, the Philippines, and Puerto Rico took part in the work of translation.

This is the fourth edition of the United States Pharmacopoeia which has been translated into Spanish and published

* Refers to article, "Use Destruction in the Human Body," in CALIFORNIA AND WESTERN MEDICINE, December issue.

* By vote of the State Board, the quarantine was approved.

by the United States Pharmacopoeia Board of Trustees. It was originally provided for use in the Philippines and Puerto Rico and also in Cuba, where it was promptly adopted as the official Pharmacopoeia. It is now also official in Costa Rica, Nicaragua (together with the French Codex), Panama, and the Dominican Republic.

The Board of Trustees, in announcing this new edition to the health departments of the republics of Central and South America have expressed the hope that it may be useful to them in the preparation of their own pharmacopoeias, and that it may assist in bringing about uniformity in titles, strengths, and standards of purity among the medicines used in Pan-American countries.

As it has required considerable time for the translation and printing of the Spanish Edition, alterations and corrections, published in the U. S. P., XI, First Supplement, which became official December 1, 1937, have been incorporated.

The book is now on sale by the distributors, The Business Publishers International Corporation, 330 West Forty-second Street, New York, N. Y.

Concerning the conquest of syphilis and gonorrhea. A statement from Surgeon-General Thomas Parran.

To the Editor: The conquest of syphilis and gonorrhea is not a task for official health agencies alone, nor yet for physicians alone. It still is a task for the whole people.

The American Social Hygiene Association is the one national voluntary agency primarily concerned with the prevention and cure of the venereal diseases. It is an organization through which citizens everywhere have an opportunity to do their part in this task.

The Association has been and continues to be not merely a valuable, but an indispensable ally of health authorities and the medical profession in their battles against these diseases. As a member of the Board of Directors of the Association and as a public official, I long have been in a position to observe how important to official health activities is the work of this voluntary agency and its affiliated state and local groups.

The Association's work is particularly needed just now to sustain the new national interest in the dangers of syphilis and gonorrhea, to explain approved measures of control and encourage their practical application, and to aid in the correction of social and educational conditions which favor the spread of these diseases.

By the union of public and private efforts we can minimize syphilis and gonorrhea and the ill health, suffering and waste they cause.

THOMAS PARRAN.

Concerning "the Foundation Prize" of the American Association of Obstetricians, Gynecologists, and Abdominal Surgeons.

Huntington, West Virginia,
January 11, 1938.

To the Editor:—Since the announcement a few weeks ago of the award to be made by this Association there have been many inquiries received by the secretary.

I am enclosing to you a copy of the rules governing the awarding of this prize. I will appreciate it very much if you will run this in your journal as a news note. There may be members of the profession in your State who would be desirous of submitting a manuscript in this competition.

With my very kind regards, I am

Sincerely yours,

JAMES R. BLOSS, M.D.,
Secretary.

* * *

Rules governing the award of "The Foundation Prize" of the American Association of Obstetricians, Gynecologists, and Abdominal Surgeons:

1. The award, which shall be known as "The Foundation Prize," shall consist of $500.

2. Eligible contestants shall include only (*a*) interns, residents, or graduate students in obstetrics, gynecology, or abdominal surgery, and (*b*) physicians (with an M.D. degree) who are actively practicing or teaching obstetrics, gynecology, or abdominal surgery.

3. Manuscripts must be presented under a nom de plume, which shall in no way indicate the author's identity, to the secretary of the Association together with a sealed envelope bearing the nom de plume and containing a card showing the name and address of the contestant.

4. Manuscripts must be limited to 5,000 words, and must be typewritten in double-spacing on one side of the sheet. Ample margins should be provided. Illustrations should be limited to such as are required for a clear exposition of the thesis.

5. The successful thesis shall become the property of the Association, but this provision shall in no way interfere with publication of the communication in the journal of the author's choice. Unsuccessful contributions will be returned promptly to their authors.

6. All manuscripts entered in a given year must be in the hands of the secretary before June 1.

7. The award will be made at the annual meetings of the Association, at which time the successful contestant must appear in person to present his contribution as a part of the regular scientific program, in conformity with the rules of the Association. The successful contestant must meet all expenses incident to this presentation.

8. The president of the Association shall annually appoint a Committee on Award, which, under its own regulations shall determine the successful contestant and shall inform the secretary of his name and address at least two weeks before the annual meeting.

MEDICAL JURISPRUDENCE†

By HARTLEY F. PEART, ESQ.
San Francisco

The Legal Status of Physicians Under the Workmen's Compensation Act

Summary of Industrial Accident Legislation.—In 1918 the people of California adopted a constitutional amendment which created an Industrial Accident Commission and vested in the legislature plenary power to create and enforce a complete system of workmen's compensation. The constitutional amendment defines such a system as including "full provision for such medical, surgical, hospital and other remedial treatment as is requisite to cure and relieve from the effects of such injury." (Article XX, Section 21, Cal. Const.)

The Workmen's Compensation Act, adopted by the legislature pursuant to the constitutional provision, uses the following language with respect to medical and hospital treatment: "Where liability for compensation under this Act exists, such compensation shall be furnished or paid by the employer and be as provided in the following schedule: (*a*) Such medical, surgical, and hospital treatment, including nursing, medicine, medical and surgical supplies . . . as may reasonably be required to cure and relieve from the effects of the injury, *the same to be provided by the employer,* and in case of his neglect or refusal seasonably to do so, the employer to be liable for the reasonable expense incurred by or on behalf of the employee in providing the same; provided, that if the employee so requests the employer shall tender him one change of physician and shall nominate at least three additional practicing physicians competent to treat the particular case, or as many as may be available if three cannot reasonably be named, from whom the employee may choose; the employee shall also be entitled, in any serious case, upon request, to the services of a consulting physician to be provided by the employer; *all of said treatment to be at the expense of the employer.*" (Deering's General Laws, Act 4749, Section 9a.)

Section 16 of the Workmen's Compensation Act provides for medical examinations of employees upon written request of the employer, which examinations are to be made by a practicing physician and are to be paid for by the employer.

Thus it may be seen that, under the Workmen's Compensation Act, medical, surgical and hospital treatment must be made available to injured employees, and the services must be rendered by physicians *selected and paid for by the employer.* The Act authorizes employers to protect themselves against liability for compensation (which includes cash award and medical and surgical treatment

† Editor's Note.—This department of CALIFORNIA AND WESTERN MEDICINE, containing copy submitted by Hartley F. Peart, Esq., will contain excerpts from and syllabi of recent decisions and analyses of legal points and procedures of interest to the profession.

and hospital facilities) by taking out insurance in a private company authorized to write workmen's compensation insurance, or in the State Compensation Insurance Fund, an insurer operated by the State of California. Inasmuch as most all employers avail themselves of the right to secure insurance, it follows that in most instances payment for physician's services to injured employees is made by an insurance company for and on behalf of the employer under an insurance contract by which the insurance company agrees to assume the employer's liability under the Workmen's Compensation Act in return for stated premiums. Hence, although the Workmen's Compensation Act imposes the liability for payment of physician's services upon employers, as a matter of actual practice such payment is made by the insurance carriers for the employers.

Effect of Workmen's Compensation Constitutional Provisions and Statutes on Practice of Medicine—Corporate Practice.—At this point it should be made clear that the Workmen's Compensation Act is a statutory exception to the general rule that a corporation may not engage in the practice of medicine or surgery. The people of California, through their Constitution and the Workmen's Compensation Act, have determined that for the purpose of industrial injuries only, it is competent for a corporation, *i. e.,* an employer and its insurance carrier, or both, to select physicians for third persons, *i. e.,* injured employees, and to pay for the professional services of the physicians so selected. This is the practice of medicine or surgery by corporations, since corporations control the payment for professional services rendered to others, but it is not in this instance unlawful because of express constitutional and statutory provisions. It is, of course, in all *other* instances unlawful.

Right of Physicians to Compensation Where Employee Treated Was Hired in Another State.—If a physician renders professional services to an injured employee, and the employee does not seek an award of compensation from the Industrial Accident Commission, the physician cannot commence a proceeding before the Commission for compensation for medical services unless the injured employee is also a party to the proceeding. (*Pacific Employers Ins. Co.* vs. *French,* 212 Cal. 139; *Independence Ind. Co.* vs. *Industrial Acc. Comm.* 2 Cal. (2nd) 397.)

The most difficult problems with regard to the Workmen's Compensation Act arise from the fact that present-day commercial and business enterprises are nation-wide and even world-wide, so that employees are often employed in one state and work in another state. When an employee is employed, say, in State A to work in State B, and is injured while in State B, a question at once arises as to which state, A or B, has jurisdiction under its Workmen's Compensation Law. This problem is extremely important to physicians, and may be illustrated by reviewing the case of *Pacific Employers' Ins. Co.* vs. *Industrial Acc. Commission,* 95 Cal. Dec. 107, decided by the Supreme Court of California on January 31, 1938. The facts were these: One Tator, a chemical engineer, was employed in Massachusetts by a business concern, and several years later was sent to a branch plant of his employer located in Oakland, California, for the purpose of solving, if possible, a technical problem confronting the Oakland plant. His presence in Oakland was considered temporary by both his employer and himself. While in Oakland he was injured and medical services were rendered to him by several physicians. The insurance company carrying Tator's employer's workmen's compensation insurance in California refused to pay any compensation or to pay the physicians, on the ground that Tator was a *Massachusetts* employee and, hence, was only entitled to receive compensation in *Massachusetts* from the Massachusett's insurance carrier of Tator's employer. If the insurance company's position had been sustained, it would have meant that Tator's physicians would have had to proceed in Massachusetts to collect, if possible, their compensation. The California Supreme Court, however, held that it would be obnoxious to the public policy of this State to deny persons who have been injured in this State, although residents of another state, the right to apply for compensation, when to do so might require physicians and hospitals to go to another state to collect charges for medical care and treatment given to such persons. It was, therefore, decided that Tator was entitled to compensation and that his physicians were entitled to be paid in California.

This decision is so important to the medical profession that, at the risk of repetition, portions of the court's opinion will be quoted:

Upon the principles which have been stated and applied in these cases, Mr. Tator cannot recover compensation in California unless this State has a governmental interest in the controversy superior to that of Massachusetts. At the time of his injury, Mr. Tator was a resident of Massachusetts. He was employed there, and was subject to the direction of officers of the employer there located. His salary was paid to him in that state, and he had come to California only on a specific errand for his employer. Under these circumstances the interest of California, like that of New Hampshire in the Clapper case, *supra,* is only "casual" unless there are other facts upon which a governmental interest may be based. It is urged that this interest may be found in the medical and hospital expenses which were incurred in this State and had not been paid at the time of the hearing.

The modern view that the cost of industrial injuries is properly a part of the expense of production underlies all workmen's compensation laws. (*Western Ind. Co.* vs. *Pillsbury,* 170 Cal. 686.) The public has a direct interest in the results of industrial accident. When the injured employee had only a right of action for damages, he too often became an object of charity. Even under present laws the public bears some part of the expense of such accidents in addition to the amount which is added to the cost of manufacture. The public, therefore, is vitally concerned to see that adequate medical care is furnished to those injured.

This court has said: "As a practical matter, injured employees as a class will receive better and more willing medical service if remuneration for such services from an employer or insurance carrier is assured to doctors and hospitals than in instances may arise in which, if an employee neglects to file a claim for compensation, after the services have been rendered, such doctors and hospitals may be required to look only to the injured employee for compensation. It should be borne in mind that the medical, surgical and hospital treatment which is intended to be assured to injured employees as one of the items of their compensation by the Act, will be more certain to be furnished if doctors and hospitals are assured of certain remuneration for their services." (*Independence Indem. Co.* vs. *Indus. Acc. Com.,* 2 Cal. (2nd) 397, 404.)

The public policy of California upon this question has been clearly and positively stated in the Constitution, the Workmen's Compensation Law which was enacted pursuant to it, and the decisions of this court. It would be obnoxious to that policy to deny persons who have been injured in this State the right to apply for compensation when to do so might require physicians and hospitals to go to another state to collect charges for medical care and treatment given to such persons. Under these circumstances the governmental policy of California weighs more heavily in the scale of decision than the law of Massachusetts, and the conflict in laws must be resolved in favor of the state where the injury occurred.

The award is affirmed.

SPECIAL ARTICLES

SOME LOS ANGELES COUNTY HOSPITAL PROBLEMS: COMMENT*

Most members of the Los Angeles County Medical Association are aware that during the week just passed the newspapers have carried a series of reports referring to the Los Angeles County Hospital, founded on an editorial in the February OFFICIAL JOURNAL of the California Medical Association (on page 73), which in turn was based on an article in that issue (on page 97), contributed by your speaker.

It may be assumed, therefore, that the subject upon which further comment will now be made is not entirely new.

Some of the special issues involved concern matters such as the following:

The types of patients who are admitted to the County Hospital.

The bills which are rendered to them, after they leave the institution.

* Read by George H. Kress, M.D., Los Angeles, at the general meeting of the Los Angeles County Medical Association, on February 17, 1938.

For other comment on this subject, see February issue of CALIFORNIA AND WESTERN MEDICINE, on pages 73 and 97, and in this issue, on page 156.

The nature and fairness or unfairness of the Los Angeles County Hospital's fee bill for hospitalization services.

The misrepresentation in the statements rendered, which give the impression that professional care, rather than hospitalization, is being charged for.

The fact that the bills and legal demands are rendered not only to near- (medical) indigents, but to proved indigents.

The blunt legal language used in the demands for repayment to the county rendered to indigents.

The system of making indigents, or near-indigents, sign promises to pay, and of making liens on insurance policies and other equities in any small properties of these poverty or near-poverty stricken persons.

The follow-up system used by the County's Collection Bureau, when it makes it demands for repayment, on the indigent, and medical- or near-indigent groups.

* * *

Our own attention was directed to all this about October last, when a laborer, who occasionally worked for me, showed a statement for $31 or so, sent to him to cover his young son's stay in the hospital.

This man cannot speak English, has a wife and three minor children, and in his jobs as a day laborer probably cannot average more than $70 a month. On this amount he must rent a house, clothe and feed five persons. In response to my inquiry, the officials wrote that nothing could be done in his case, and suggested that this hard-working, honest man should arrange to pay back one dollar a month.

To me such a request or demand (to the Mexican laborer, equivalent to a demand) did not seem a fair proposition from the great county of Los Angeles.

In discussing the matter with colleagues, my attention was called to other even more aggravating cases: one especially glaring example being that of the woman for whom a cesarean section had been necessary, and who received a bill from the county for $136.80 to cover a single operating room use in the Los Angeles County Hospital.

In the meantime, sensing that a system was in vogue in the Los Angeles County Hospital with which members of the medical profession would not be in sympathy were all the facts known, correspondence was started, as given in the exhibits of the article which appeared in the February issue of California and Western Medicine.

In the limited time at our disposal this evening, it is not possible to go into details about all this. As was stated in the public press on Saturday last, February 12, a hearing was called by Supervisor Gordon McDonough, to which were invited representatives of the County's Charities, Legal and Auditing Departments, and also members of the Executive Medical Board of the attending staff. The newspapers had previously printed five topics which would be discussed. The County Counsel read the joint report prepared by his own and the County Hospital departments on the aforesaid topics. Anticipating what would happen, we also prepared and read the following report, and this I shall now offer again, because it comments on a few of the questions at issue.

* * *

[MEMORANDUM SUBMITTED ON FEBRUARY 14, 1938, BY DR. GEORGE H. KRESS, ON PRESS ITEMS CONCERNING THE LOS ANGELES COUNTY HOSPITAL, WHICH WERE PRINTED IN THE NEWSPAPERS OF SATURDAY, FEBRUARY 12, 1938

"Permit me to state at the outset that the twenty-page presentation of the Los Angeles County Hospital Collection Bureau problems, which is printed in the February issue of the Official Journal of the California Medical Association, practically outlines some of the major issues under consideration.

"I may add further, that no statements thus far appearing in the public press, presumably from interviews with county officials, lead me to think that any retraction should be made on what was printed in the State Medical Association's Official Journal.

"Allow me to say, also, that the Los Angeles County Hospital problems, to which attention has been called, are too big and altogether too important for possible solution at any single, or even a series of conferences such as this morning's session will probably be. What is needed, in the premises, are not merely opinions of interested parties, but rather the presentation of factual information secured after proper investigation by competent, impartial persons, to show whether the conditions complained of do, or do not exist.

"Let us take up, now, for consideration the five topics which Saturday's press announced would come before this February 14 conference body:

• • •

"Topic One: 'The Appellate Court decision in the Goodall vs. Brite case in Kern County, defining the county's responsibility relative to the operation of county hospitals and the fixing and collecting of fees.'

"Comment: The Kern County Hospital Appellate Court decision embodies, under item 8, its injunction provisions. None of the legal authorities of Los Angeles has given us thus far any specific references in the text of the Appellate Court decision which affirm that it is mandatory to send bills for board, room, and nursing (hospitalization services) to every indigent patient, and it is our own opinion and also that of friends in the legal profession that there is no mandatory legal authority for such bill-sending.

"Permit us, also, to call the attention of this conference group of county officials and attending staff representatives to the fact that we have with us this morning Mr. R. E. Heerman, present superintendent of the California Hospital of Los Angeles and a trustee of the Associated Hospitals of California, who was president of that organization when it appeared before the Fourth District Appellate Court on behalf of the respondents in the Kern County case. Also there is present Mr. Howard Burrell, who, as a 'friend of the court,' submitted the briefs on behalf of the Associated Hospitals of California. If this conference desires expert and legal opinion on hospital matters, why not give Mr. Heerman and Mr. Burrell the privilege of the floor and let them answer questions?

• • •

"Topic Two: 'Types of patients admitted at the General Hospital.'

"Comment: Any statement by the County Hospital authorities on this subject should be in detail and in writing, and should specifically comment on the hospitalization of:

1. Totally indigent citizens;
2. Partly or medical indigent persons;
3. Non-indigent patients; and also on
4. County employees; and on
5. Industrially injured citizens.

"The statement by the hospital authorities should be comprehensive and accurate, and indicate the approximate number of patients coming under each of the above groups, who were admitted during the last year or so.

"The admission requirements, likewise, as well as the types of prior or subsequent social service reports on applicants, and the manner in which the above classes of patients are tabulated in the County Collection Bureau, are matters worthy of meticulous study and report. No brief verbal statements concerning these matters will suffice.

• • •

"Topic Three: 'Comparison of charges for service with those of private hospitals.'

"Comment: In the Saturday press items, County Hospital Superintendent Gray is quoted as giving, as the estimate of himself and his associates, the figure of $6.39 for a private hospital ward bed, as compared with $3.81 per day for a ward bed in the County Hospital.

"In regard to the average ward rate of the accredited private hospitals of Los Angeles, why not find out, first, whether what is called the ward rate per day in the County Hospital includes all items of overhead which private hospitals must meet, such as:

"Interest on capital investments (Los Angeles County probably having about $20,000,000 of capital investment in the County Hospital.)

"Insurance (even though Los Angeles County insures itself, when costs are estimated that item should be included).

"Depreciation, etc.

"In other words, when ward rates are compared between the Los Angeles County Hospital and private hospitals,

it is important to learn whether the same thing is always being talked about. Otherwise, the conversation may merely be a discussion of misinformation. A very explicit statement in writing by the proper County officials is desirable on these points.

"Here, also, why not call in the local representatives of the Associated Hospitals of California and hear their opinions? These taxpaying hospitals do much charity work, and if their rights are being encroached upon because the County Hospital admits pay patients who are not legally entitled to County Hospital care, that matter should be carefully investigated. We feel certain that the Associated Hospitals of California will be happy to coöperate in these matters.

"Concerning Superintendent Gray's figure of $3.81 as the County Hospital ward rate per day, as noted in Saturday's press items, how is this to be reconciled with the fee table which his office recommended the Los Angeles Board of Supervisors to adopt on June 29, 1937, and which contained rates varying from $3.17 to $8.54 for a ward bed per day?

"The question also arises: If the cost in the County Hospital is only $3.81 per day per ward bed, by what legal right can bills be rendered for more than this amount, and, especially so, to indigent citizens? To ask recipients of public aid for more than actual costs would seem to be a violation of State law.

"In the fee tables at our command at the time of this writing, we note among private hospitals in Los Angeles the following daily ward rates: Children's Hospital, $4; St. Vincent's Hospital, $4; Queen of the Angels Hospital, two-bed room, $3.75 to $4; French Hospital, $3.75; California Hospital, children's ward $3.50, four-bed ward $4; Methodist Hospital, $3.75; Cedars of Lebanon Hospital, $4.50; Hospital of the Good Samaritan, industrial floor, two-bed room, $4 to $4.30 per day.

"In Saturday's press items, the Medical Director of the County Hospital, Doctor Berman, commented upon a patient who, in the article which appeared in the Official Journal of the California Medical Association, was given as a fee table example, and who received an itemized statement having as one single charge the following:

October 5, 1937. Operative—Cesarean section.....$136.80.

"In regard thereto, Doctor Berman was quoted as saying the patient was in the operating room for three hours and that 'in a private hospital her bill would have been more than $1,000.'

"If Doctor Berman was correctly quoted (and the item appeared in more than one newspaper), his statement must sound absurd to all physicians who are familiar with the charges for use of operating rooms (and operating-room expenses, not professional services of attending staff members, are the things for which the county of Los Angeles has a legal right to make charges).

"As a matter of fact, an average charge for the use of an operating room in a private hospital in Los Angeles for a minor operation would be $7.50 to $10, and for a major operation $15 to $20. If the operation lasts longer than one or two hours, then sometimes an extra charge of $1 to $2.50 or so per hour is made, so that if Medical Director Berman now states he meant 'professional services,' then since he, himself, has never been in private practice, it may be proper to inform him that if a physician charged $1,000 for an operation to an indigent person, and the matter were called to the attention of the Los Angeles County Medical Association (in case the doctor was a member), such a member would be haled before the constituted authorities for disciplinary action.

"Doctor Berman was also quoted as saying that the charge of $136.80, for a single session in the operating room, covered not only the cesarean section but several operations at the same time, etc. However, the bill stated the charge of $136.80 was for aid by the Department of Charities on date of October 5, 1937. It may be proper to add that Doctor Berman's method of describing an operation in terms of multiple operations is quite unusual, and it would be interesting to have him tell the medical members of the Executive Board more about these multiple operations and why they add materially to the overhead cost in the 'use of an operating room.'

"Topic Four: 'Explanation of the accounting system as established at the hospital by the County Auditor's staff.'

"Comment: Here also we believe an exact and comprehensive statement in writing would be quite in order; and appended thereto should be copies of all the different form follow-up letters sent to indigent and other patients, used during the last six months, as well as copies of memoranda or other instructions given to field representatives of the County Collection Bureau, who are sent out to interview former patients about payments due, etc.

• • •

"Topic Five: 'Collection policy of the County Charities Department in collecting for service rendered patients at the General Hospital.'

"Comment: What has been said under Topic Four applies here also."

• • •

"In conclusion, may we submit that one way to get at the bottom of this intricate matter would be to send out a questionnaire letter, properly phrased, to every one of the 32,469 former patients of the Los Angeles County General Hospital who received hospitalization care during the period July 1, 1937 to December 31, 1937, inclusive, the aforesaid bills totaling $2,366,779.30, or an estimated total of $4,733,588.60 for the year! From letters and telephone messages which have come to the Los Angeles County Medical Association during the last week, we believe such an approach would bring out some very illuminating facts and other information.

"Supervisor McDonough, permit me to remind you and the members of this morning's conference that in our correspondence with the County Hospital and Collection Bureau officials, as carried on during the last four months, we stated at the outset and subsequently, that it was our purpose to discuss this matter editorially, with information appended, in the Official Journal of the California Medical Association.

"More than five hundred members of the Los Angeles County Medical Association gratuitously give, each year, to the indigent sick, and taxpayers of the county, professional services having an estimated money value of more than two million dollars ($2,000,000). This humanitarian donation by the medical profession to the sick poor of Los Angeles County entitles its members to a careful hearing when they plead for kindly hospitalization care on behalf of indigent citizens, and also for a strict adherence to the State laws governing county hospitals."

* * *

The above concludes the written statement presented on Monday last. At the close of that meeting, Supervisor McDonough appointed a joint conference group of county officials and the Executive Medical Board of the staff to make a further study of the problems. What will result from the future meeting or meetings of this conference group we, of course, do not know.

To Summarize: In common with many other physicians familiar with the situation, we believe the printed articles already referred to were more than justified; and it is our further belief that some of the evils complained of will be remedied as a result of the publication.

Certainly, at least one good result has already been attained, namely, that of acquainting the more than two million citizens of Los Angeles County with the fact that the medical profession of Los Angeles annually donates to the poor who are sick, and to the taxpayers of our county, professional services having a money value of more than $2,000,000 (or about the same that the entire city raises for its yearly Community Chest goal). As a result of that publicity, we are in much better position to obtain a yearly printed report of the professional work of the staff, an effort which during the last ten years has failed of accomplishment.

The legal authorities of the county also acknowledged at the end of Monday's meeting that there were no specific statements in the Kern County Hospital-Appellate Court decision making it mandatory to send statements for hospitalization to indigent citizens.

Before the investigation is finished we hope to see an explicit set of rules promulgated by the county authorities that will clearly demark, in compliance with provisions laid down in the State law, the following:

The type of citizens who are eligible to admission and the type to be excluded in the Los Angeles County Hospital;

A more equitable fee table for County Hospital hospitalization charges, and the adoption of a system in which the patient or a legally responsible relative will be told, at the time when the patient is admitted, concerning the ward rates per day and possible accessory costs of hospitalization care.

Cessation of, shall we say, what is almost a dishonest practice of the County in giving the impression to these indigent sick persons that the bills are for professional care;

And to bring about also a somewhat kindlier follow-up system in the Hospital's bill-collecting methods.

Many other matters, each worthy of a separate text, might all be brought forward for consideration, and these may be discussed in the future.

727 West Seventh Street.

ADDENDA

LOS ANGELES COUNTY HOSPITAL: SOME SELF-EXPLANATORY LETTERS

In the February issue of California and Western Medicine, on pages 73 and 97, certain procedures in vogue at the Los Angeles County Hospital for some time past were discussed and admission requirements and other matters criticized. Supplementary to last month's articles, and comment on page 156 in this issue, the following letters, presenting an interesting story, are taken from a large number received after the above referred to articles were commented upon in the daily papers:

* * *

[An Opinion of the Legal Counsel of the Associated Hospitals of California, with Special Reference to the Appellate Court Decision in the Kern County Hospital Case]

(COPY)

Los Angeles, California,
February 14, 1938.

To the Board of Supervisors
of Los Angeles County,
Los Angeles, California.
Gentlemen:

The undersigned are the attorneys for the Association of California Hospitals. This Association represents the interests of the private hospitals of the State of California.

We understand that there is pending before your honorable board, or a committee thereof, among other things relating to the Los Angeles General Hospital, two questions:

1. The type of patients admitted at the General Hospital; and
2. The matter of the accounting system involving billing and liens.

As to the first, the case of *Goodall* vs. *Brite*, 11 Cal. App. (2d) 540 (decided January 30, 1936),* establishes certain principles:

That there are three classes of persons who may claim the right to be admitted to the Hospital:

1. Indigents.
2. Persons of some means, but not sufficient to pay for maintenance in a private hospital after providing for those who legally claim support.
3. Emergency cases, regardless of the ability to pay.

The decision, of course, is definite that persons who are able to pay should not be admitted, and that due inquiry and investigation should be made to ascertain the facts. We assume that the Board of Hospital Management has conformed its practice to the principles laid down in this case. We also assume that the Board of Supervisors, in conformity with Sections 2576, 2600, and 2603 of the Welfare and Institutions Code, has established regulations in respect to the amount of property and the income, and the obtaining of liens upon property of patients falling within the second classification above set forth.

In regard to the matter of accounting, and particularly billing patients entering the County Hospital:

As to persons falling in Classes 2 and 3 above, no particular question is presented. Obviously, the hospital management should bill and attempt to collect from persons falling within these two classes. In regard to indigents having no present property, we find no requirement in the statute that they should be billed. We recognize, of course, that under Section 2603 the county has the right to recover a reasonable charge for services rendered if the person should at a future time acquire property. We assume that this section is the basis for the existing practice of billing indigents. As a practical matter, some considerable cost is involved in billing a class of patients from whom no return can be expected, and it would seem soon enough to go to the accounting and billing expense when the management has reason to believe that the patient has property or income from which payment can be made or collected. We do not believe that the taxpayers should sustain the cost of an expensive accounting and billing system in regard to all of the indigents, when as a matter of fact in only a very small percentage of cases will the county be able to collect anything. We believe it proper to consider the effect upon the needy if they are billed and pressed to pay. To emphasize this feature may engender the belief that the social function and service is secondary, and that collection is the primary concern.

1175 Subway Terminal Building,
Los Angeles, California.

Yours very truly,
Musick and Burrell.
By Howard Burrell.

[Another Legal Opinion, from a Lawyer Friend, in Which Comment Is Made on the Interpretation of the Appellate Court Decision in the Kern County Case]

(COPY)

"Dear Doctor:

"What is published as the decision or opinion of the court is made up of two parts: First, a statement by the court of the essential facts of the case as presented by the parties, with comments and reasoning of the court pertaining to them. Second, the judgment of the court. It is the judgment of the court that tells the parties what they must and what they must not do.

"In the present instance, the judgment of the court is found in the eighth section of the published decision, in two paragraphs, each beginning: 'It is therefore ordered, adjudged and decreed." The first of these paragraphs orders the defendants in this case to desist from admitting to and receiving as patients of the Kern General Hospital any person who, after due inquiry and investigation, is not found to be 'an indigent person' as defined in the decision, except under certain circumstances stated in the judgment, under which a non-indigent person may be admitted; or 'a dependent or partially dependent person *in case of emergency*, or who is found, after due inquiry and investigation, to be a person who is himself, or has a relative or relatives legally liable for his support, able to pay for and obtain proper and necessary medical or surgical or hospital care or treatment or services for himself elsewhere than in the county hospital' except as otherwise specified in the judgment. The judgment specifically defines certain classes of persons who should be admitted, including 'an indigent sick or dependent poor person' and 'a needy sick and dependent or partially dependent citizen in case of emergency.' I have underscored *'in case of emergency,'* not because it seems to have any specific applicability to the controversy in which you are now engaged, but to call your attention to it as being obscure in meaning in its present setting.

"Certainly, nothing in the judgment of the court even suggests to a reasonable person any obligation on the part of the defendants to collect from indigent persons or dependent or partially dependent persons, anything whatsoever.

* Editor's Note.—The full Appellate Court decision in the Kern County Hospital case is printed in full in California and Western Medicine, February, 1938, on page 106.

"What the court did say was:

In their rules of admission they [the Board of Supervisors] should have the power to provide for the payment for care by those not financially able to secure hospitalization in a private institution, the amount to be paid to be determined to its maximum by the cost to the county of hospitalization of each individual patient and charged to the patient on his ability to pay.

"One who is inclined to quibble might claim that the phrase 'the amount to be paid to be determined to its maximum by the cost to the county of hospitalization of each individual patient and charged to the patient on his ability to pay' is separate and distinct from the clause in the same sentence that 'they (the Board of Supervisors) should have the power to provide for the payment.' Any such construction, however, unless there is some question of the legal authority of the Board of Supervisors to provide for payment, would clearly leave meaningless the statement in the opinion of the court that the Board of Supervisors, in their rules of admission should have the power to provide for payment. The court does not say power to *compel* payment, but power to *provide for* hospitalization of each individual patient should be 'charged to the patient on his ability to pay' it clearly implies that if a patient has no ability to pay, nothing should be charged to him, that if he is able to pay, say $1 or so a week, only that amount should be charged to him and to the extent that such a patient is able to pay only less than the entire cost of hospitalization *in his own particular case,* the Board of Supervisors should in their rules of admission provide for payment of the balance. Of course, here I come back to a clause that I have stated above, which makes this reasoning dependent on the legal authority of the Board to use public funds to pay the cost of hospitalization of totally indigent persons and the balance of the cost of hospitalization of persons able to pay only in part for the services rendered. Such authority seems to be clearly implied in the opinion of the court. . . .

"Personally, it looks to me as if the Board of Supervisors, . . . the defendants in this case, had any thought that the judgment of the court was in any way obscure, the proper course would have been for them to have applied to the court for instructions. The fact that they have elected to charge persons for services amounts that they knew such persons would never be able to pay, and the fact that they have under the pretended cover of a court order spent public money in efforts to collect accounts which they knew were uncollectible, without asking further instructions from the court, would seem to me, in view of the clarity of the court's decision and judgment, to come very near to exposing them to punishment for contempt of court."

[Letter from a San Francisco Colleague]

(COPY)

San Francisco, February 15, 1938.

Dear Doctor:

The profession of the State of California owes you a debt for the amount of work you have put in, in attempting to straighten out the whole subject of county hospitals, by taking up the situation in Los Angeles.

According to the decree of the Appellate Court, Fourth District, confirming the opinion of Judge Van Zante, public hospitals in California cannot hospitalize non-indigent patients. As a matter of fact, at least thirty of them do so, and the abuses incident to this have led to a strong feeling on the part of Farm Bureaus, whose bill before last year's legislature, to open the county hospitals to everybody, was the result. I was asked to speak before the National Farm Bureaus in Pasadena the spring before, but to avoid the subject of the county hospitals. This latter I declined to do, because I felt that the Farm Bureaus were going at the thing in an entirely wrong way. We have not quite one county hospital to each county, but of the fifty-seven hospitals only sixteen are Class A, and four are Class B. Most of the rest are scarcely decent, and some of them are a disgrace to modern civilization. They are unworthy of the name "hospital."

In view of the fact that county hospital construction is passing through the same evolutionary stage that public school construction is passing through in this State, and we point with equal pride to some of our magnificent county hospitals as well as our public schools, I think it is fair to follow the possible developments ahead a little, and examine the subject carefully to see if the time has not come when the county hospitals should all be raised to Class A or B standard, and the situation which holds in the Buffalo General Hospital be made to apply. Furthermore, these hospitals could then become the health centers for the counties, which in all but the large cities are indispensable. In Buffalo the Public Welfare Board, and not the Supervisors, determine who shall be admitted to the hospital, and what that individual shall pay, if anything. He has the right to be cared for or operated upon by his own family physician. What he pays for his bed is a matter of record with the Commission, but what he pays his doctor is entirely between the doctor and himself. In this way when patients are embarrassed for money to meet emergencies they can still be dealt with as independent factors in the community, and not as paupers or indigents. They are not subject to the care of such glorified collection agencies as have been brought into operation in a number of our cities, and the feeling on the part of the doctors that they were rendering a charitable service to the people.

There have been objections to the Government entering into medicine at all, but I think that is felt mostly by unthinking physicians who would be loath to do without Government standardization in much that pertains to medical education, drugs, and a great deal that enters into successful practice.

Six years ago the Committee on the Costs of Medical Care called attention to the fact that, of the 3,078 counties in the United States, over 1,000 had no county hospitals, to say nothing of the extremely poor standards of many then in existence. An opportunity was presented at that time, during the depression, to seek Government aid in a health program, to secure loans for suitable county hospitals, with the provision that they be operated under standards which a department of public health would lay down. The Government could not have used its project policy to greater advantage than to supply first-class county hospitals where they were needed. The Committee on the Costs of Medical Care showed that 73 per cent of the hospital beds in the country were tax-supported, and the rate of increase was over one per cent a year. In San Francisco, since that report, there have been over 1,500 new tax-supported beds put into use—in the Marine Hospital, the Veterans Facility, the top floor of the San Francisco General Hospital, and in the new hospital for the insane and cancer cases. This is an example merely of how surely the need for hospitalization is being taken over as a Government function.

It seems quite clear that the day of the private hospital is about over, as are private schools. A few will always exist and they will serve a good purpose, but steadily the work of each community will be done more and more in the large hospitals which are mainly supported by tax funds. Teaching hospitals will always exist. Heavily endowed religious hospitals are likely to continue, and such hospitals as our Southern Pacific Hospital for the care of industrial cases, will inevitably go on, but we should make the use of the beds in the tax-supported hospitals available to the public at large, and they should certainly be of use to the taxpayers. Your $18,000,000 County Hospital in Los Angeles, with its additional millions in equipment, presents a problem that might be applied to every community. It is a dreadful thing to the great working class to realize that 300,000 Mexicans and 60,000 negroes, who pay little or nothing in taxes, can be taken in, where a small wage-earner with his large family is ruled out. May I call your attention to the statement on page 9 of Los Angeles County's publication on budgets, to the effect that in that county a man with a wife and two children, earning $60 a month or less, is entitled to care in the hospital, but if he earns $61 he and his family are not entitled to it. I do not believe that that fact is known to the physicians in Los Angeles County, and I do not believe there is a single one of them who wants to earn any of that family's money which must go for rent, food, clothes, etc.

909 Hyde Street.

Very truly yours,

PHILIP KING BROWN.

[Letter from the East]

(COPY)

AMERICAN MEDICAL ASSOCIATION

Chicago, February 16, 1938.

Dear Doctor:

I have been much interested in the material that you have sent me pertaining to the hospital situation in Los Angeles. . . .

I have some very definite convictions about hospitals and hospital management, and one of them is to the effect that few hospitals with a capacity exceeding four or five hundred beds can be run economically or with the greatest possible efficiency. I believe that the excess machinery that is necessary to operate a tremendous institution sooner or later creates complications of very serious nature, and I do not think that dangers of this nature are at all reduced when the big institutions are owned and controlled by governmental agencies.

With most cordial good wishes, I am

535 North Dearborn Street.

Very truly yours,
OLIN WEST, M.D.,
Secretary and General Manager.

[Experience of a Long Beach Physician]

(COPY)

Long Beach, California,
February 14, 1938.

My Dear Doctor:

I have read with much interest some of your comments on the conduct of "Outdoor Medical Relief" and other charity work, both in and outside our County Hospital. I want to commend your stand in these matters. This whole county relief program has violated many of the fundamental principles of aid to the truly indigent. Its beneficiaries are the vast army of salaried employees. That department has become a veritable stench in the nostrils of honest men, both among the taxpayers and our profession.

Personally, I had little or nothing to do with this service until after the earthquake, when my Long Beach offices were wrecked and I took temporary quarters with one of my friends and opened a clinic in a building in Wilmington. Almost immediately I was asked by the doctors of San Pedro and Wilmington to take care of indigents (eye, and ear cases), referred by the Department of Outdoor Relief, at San Pedro and about the harbor region.

Very soon I discovered their rolls were being padded by dozens of able-bodied adults willing to take free medical care because the indigent "Joneses" were getting their's free. I remonstrated with the head of Outdoor Relief and attended one of the so-called staff meetings at San Pedro, which was addressed by three county agents who came to tell the Harbor District doctors that their medical care was costing the taxpayers too much, and that county funds were rapidly being depleted; that whereas $1,250,000 had been asked for, only some $900,000 had been allowed by the Board of Supervisors. When I asked why there was not some way of cutting down the overhead of the salaried group, they answered that this could not be done until at least 40 per cent of the present load was lifted. When I pushed the question as to why the load was not being reduced by the social workers, the meeting broke up and we had no further answers to questions. I then notified them to send to me no more able-bodied men and women for free medical care unless the case was an emergency. To this they paid no attention. Then I notified them again and began turning back such patients to them, only to find they were referring the same patients over to other physicians.

I then sent a similar letter to each member of the County Board of Supervisors. One of these reached Rex Thompson, who promptly wrote me demanding proof of my charges. I replied that I would be glad to furnish proof aplenty before the Board of Supervisors at any time he or they desired the matter openly discussed. To this he made no reply. However, within a week two hundred workers in his department were let out, but the system has not been very much changed, so far as I can see, and every now and then some big double-fisted oil worker, who has been employed at $8 a day, slides into the line at San Pedro and gets an order to come to the county service here. It is our rule to give them emergency care or fire them back with a letter demanding that such imposition on the taxpayers and the medical profession be stopped. These letters never receive any attention in the way of a reply. They evidently do not want to have the system disturbed.

So I regard your protest as both timely and very much to the point. If social service in this work amounts to anything and served the purpose for which it is intended, there would come at least a partial cure of these evils, some of which your letter has brought to public attention. I hope you will officially and otherwise keep this question in the public eye, and I will help you all I can to drive out the graft in this whole system and make the taxpayers' money go where it should go—to pay for needed medical services both in and out of the County Hospital, to the truly indigent.

360 Juniper Building.

Yours very truly,
FRANCIS L. ROGERS, M.D.

[Letter from a Santa Monica Physician, and Reply]

(COPY)

SANTA MONICA HOSPITAL, INC.

Santa Monica, California,
February 16, 1938.

Supervisor McDonough,
Hall of Records,
Los Angeles, California.

Dear Sir:

I have noted in the public press that you are heading the committee in regard to County Hospital affairs and have thought that you might want to get the ideas of executives of some of the private institutions in regard to the present controversy.

In my opinion, it is of a great deal of value to private institutions to have the county bill patients for the amount of their hospital care while in the institution. In my opinion, it is perfectly proper that even the indigents should know the approximate cost of what the taxpayers are giving to them. It makes the people of the county conscious of hospital costs, and I am sure we have less complaint about the costs in private hospitals when the costs in public hospitals are known.

To what extent the county shall go in attempting to collect these bills is, of course, a matter of wide difference of opinion. No doubt that when patients are well social serviced before admission to the County Hospital the amount of recovery through collections will be small. However, the knowledge that the county is going to make an effort to collect when the person's condition is such that they can pay, will act as a marked deterrent to people who are trying to get something they are not entitled to have. I believe that both the medical profession and the private hospitals are being benefited by an honest effort to collect bills from county hospital patients. It makes the patients more willing to try to take care of their obligations in private institutions, both to the institution and to the doctor caring for them.

If a real desire exists to try to reduce County Hospital costs, then it might be well to investigate costs incurred at the hospital by what may easily be an excessive amount of both diagnostic and treatment procedures made use of by the staff because it is a public institution.

I have no factual knowledge as to these costs, but from general information I think much might be done there to lessen the cost to the taxpayer. It is my great desire that we shall have a County Hospital second to none and that it shall give the indigents all that they need and are entitled to.

Very truly,
W. S. MORTENSEN, M.D.

* * *

SANTA MONICA HOSPITAL, INC.

Santa Monica, California,
February 16, 1938.

Dear Doctor Kress:

The above is a copy of a letter which I have sent to Supervisor McDonough and expresses my opinion in regard to the present controversy.

I feel that this is a matter that should be carefully considered.

Very truly,

W. S. Mortensen, M.D.,
Superintendent.

* * *

February 17, 1938.

Dear Doctor Mortensen:

Thank you for sending me a copy of your letter of February 16 to Supervisor McDonough.

If you will read carefully the article on page 97 of California and Western Medicine, I think you will note, as for instance on page 102, that I also believe in submitting bills to partly indigent (medically indigent) patients, and I would let these patients receive their bills while they were in the Hospital, just as you present your statements to your patients in the Santa Monica Hospital.

As regards billing of indigents, General Counsel Peart of the California Medical Association is of the opinion that an indigent is entitled to hospitalization service at public expense.

Reference to page 108 of the February issue, item 5, about the twenty-fifth line, you will find this explicit statement in the Kern County decision: "It is admitted that a resident pauper must be hospitalized at public expense."

When it comes to sending such an individual a bill, it is my opinion that, as I stated to the conference committee on Monday morning in the office of the Board of Supervisors, such statement could be sent in the form of a courteous letter somewhat as follows:

Dear Sir:

This is to remind you that during the period ——— to ——— you were a patient in the Los Angeles County Hospital. The hospitalization given (board, room, and nursing) made it necessary for the taxpayers of Los Angeles to expend the sum of $——— for your care during the aforesaid period. There was no charge for the professional services of attending physicians and surgeons, who donate their services to the sick poor.

It is our hope that you will recognize that this is an obligation on your part and that in due time, if your means permit, you will make an effort to pay the County of Los Angeles in whole or in part for the services above rendered.

Very truly yours,

Department of Charities, County of Los Angeles.

By ———————

* * *

I am of the opinion that when you look into this matter as fully as I have, you will find that you have very little difference of opinion on some of these fundamental issues.

With best personal wishes, as always,

Cordially yours,

George H. Kress, M.D.

[Letter from a Los Angeles Physician]

(copy)

Los Angeles, February 18, 1938.

Supervisor Gordon L. McDonough,
501 Hall of Records,
Los Angeles, California.

My dear Mr. McDonough:

I want to report another victim of the abominable system used at the County Hospital, about which you see so much in the papers.

I have a patient, Mr. (name), an honest, reliable truck driver, who had a very severe bowel infection and a number of abscesses around the rectum. He had been sick for some time before I saw him and had had several operations, using up all his savings. I operated upon him on January 25, 1937, and have taken care of him ever since, for which, altogether, he has paid $15.

Last summer it was necessary to have some x-ray pictures taken, for which he was unable to pay. He was also under the care of Dr. E. L. Armstrong, who suggested that he go to the General Hospital for the x-rays and check-up, and he was given a letter to the hospital stating he was unable to pay anything.

When Mr. (name) entered the hospital there were many people in the admitting office, all of whom were asked to sign a printed form, but when he presented Doctor Armstrong's letter he was admitted without signing anything, so he assumed there would be no charge. He was in the hospital two weeks.

He had been home a short time when a representative of the hospital came with a bill, charged at the rate of $4 a day. As he had no money the representative asked to see his insurance policy, saying they would keep it at the hospital but he could get it whenever he wished. Mr. (name) was asked to sign a form allowing the hospital to collect the $20 payable monthly on the policy, but this he refused to do, stating he needed the money to live on. He did, however, sign the form with this phrase crossed out. However, a short time later the representative again called stating Mr. (name) had signed the wrong form and asked him and his mother to sign another form, which they did.

The first of the month, following this last visit, the insurance check did not arrive and, on checking with the company, Mr. (name) was advised that the check had been sent to the hospital. He called the hospital and insisted he needed the money, which they agreed to send to him. After approximately three weeks, or on December 22, they sent their check for $20. In January they sent their check on the 26th to cover money they collected on the first. They, therefore, kept the money almost a month before sending it to the patient, and they are now nearly a month behind again.

Now I call this a rotten system, as the County Hospital is supported by the taxpayers for the benefit of the indigent, and if this boy is not an indigent and a victim of circumstances, I do not know of any.

As a doctor, taxpayer, and voter, I hope the Supervisors will do something to correct this condition.

Yours very truly,

William H. Kiger.

[Samples of Letters Received from Former Patients of the Los Angeles County Hospital]

(copy)

Los Angeles, California,
February 9, 1938.

Dear Sir:

I have just finished reading your statement regarding the Los Angeles County Hospital, and wish to extend my congratulations to you in bringing this matter to the attention of the public. This insidious evil, cloaked under the guise of charity, is indeed a reflection on our city, county, and state.

Several years ago my wife, who was at that time a widow, supporting two children and an invalid mother through her own efforts and without any outside assistance whatever, was compelled, through lack of finances, to place her mother in the county hospital for treatment. I, myself, visited her mother before our marriage, and I was very much impressed with the lack of care and attention which she received while there.

Later, after our marriage, it became necessary for my wife to undergo a serious operation, for which I arranged to be performed at the Methodist Hospital. The difference in the service and attention she received there could not even compare with what her mother received at the county hospital, yet the daily rate was considerably less than that charged for her mother, who is now deceased, and for whose care she recently received a bill for the sum of $199. The itemized bill includes charges for clinical visits, and x-rays which she was given without her knowing what it was all about, as she was Italian and could not understand English. Furthermore, she was told to return to the clinic weekly and was not informed that there would be any charge for this service or what the charge would be. If this is justice, I do not see why I cannot dump a load of manure on the grounds of the county hospital and later charge whatever I may want to for same, although it was not ordered. Neither were the x-rays, etc., claimed by the hospital, ordered. Furthermore, it certainly seems to me that an institution that was originally built out of the taxpayers' money, and is exempt from taxes, and also receives approximately 21 cents from every dollar of tax receipts, plus the purchase saving that a county institution can make, should be able to operate much cheaper than a private institution that has to contend with all of the above, plus yielding a fair profit for its investors.

Well, at least I have gotten that off my chest. Should you be interested in further details regarding my wife's mother's case, I will be more than glad to furnish you with complete data on same.

Thanking you again for your fortitude in expressing an opinion that, I am sure, is shared by a great majority of the citizens of Los Angeles County.

I wish to remain

Sincerely yours,

(Name)
(Address)

* * *

(COPY)

Los Angeles, California,
February 10, 1937.

Dear Sir:

The article printed in the Los Angeles *Times*, "Hospital Cost Inquiry Slated," concerns me very much.

On (admission date) I brought my boy to the Los Angeles County General Hospital with infantile paralysis. He was discharged on August 13, for which I received a bill for $153.72. At the time, my husband wasn't earning enough to support the family with food and shelter. Not being able to pay, I was asked to surrender his insurance policy, which has been borrowed on to keep from lapsing. When I asked to have time to inquire about signing it over to the county, I was told that the treatments would be stopped. Naturally, I signed it over quick.

It seems to me we could have gotten service for that or a lot less in a private institution.

I hope this letter could be of some help to you in this investigation, and in the future help a lot of unfortunates.

Very truly yours,

(Name)

(COPY)

Los Angeles, California,
February 18, 1938.

Dear Sir:

My wife was pregnant, so went to the White Memorial for prenatal care. She made one visit and was told she had high blood pressure and that she must go home and stay in bed, which she did, the doctor coming out several times a week to see her. Her blood pressure went up to 210. As I was unemployed and could not afford to pay for her treatment, she was sent to the General Hospital as an emergency; that was on October 19, 1937. Three days later the baby had to be taken, as my wife had toxemia. The baby died on October 27, five days after birth. My wife (name) was discharged from the hospital on November 1, 1937, which made her stay in the hospital thirteen days. A week later a man called at my home from 434 South San Pedro, Room 210, asking for my wife's insurance policy, or she couldn't get any more treatment from the hospital. He stated it was the law of California for them to hold the policy until all payments had been made. I told him I wanted to pay my bill and would make payments as soon as I was able, but would not surrender the policy.

Dr. (name) from the Clinic ordered my wife in the hospital for a kidney treatment, and was to stay in the hospital for one or two nights. She had a bed-waiting list and was told to come in January 9, 1938. Upon arrival at the hospital the social worker refused to let her enter the hospital because of my refusal to give them the insurance policy. I told them I was on relief, and I still am on relief, and my wife is sick with kidney trouble and high blood pressure and I can't afford to pay a doctor. Now, my wife's bill for thirteen days is as follows:

October 19 to November 1, 1937—Obstetrical ward (adult), thirteen days at $4.46—$57.98.	
Operative—Normal delivery—$31.23.	
October 22 to October 27, 1937—Obstetrical ward (infant), five days at $1.00 per day—$5.00.	
October 27, 1937—Mortuary service, $2.91—$7.91.	$89.21
	7.91
	$97.12

This may help you understand my case. Thanking you, I remain

Yours truly,

Los Angeles, California,
February 9, 1938.

Dear Doctor:

I noticed the article printed in the *Daily News*, February 9.

I took my wife, Mrs. (name) to the General Hospital on January (date). She had pneumonia, and is still there. She told me that they had made her sign away every right in the world, and she didn't know what it was all about. At that time she was delirious most of the time and didn't know or care what she was doing. If they would just leave her alone.

Yours truly,
